contentions about Images, in which it often happened, that the Emperor declared for the images and the Patriarch against, or conversely. Streams of blood flowed as the result. Gregory Nazianzen says somewhere: "This city (Constantinople) is full of handicraftsmen and slaves, who are all profound theologians, and preach in their workshops and in the streets. If you want a man to change a piece of silver, he instructs you in what consists the distinction between the Father and the Son: if you ask the price of a loaf of bread, you receive for answer – that the Son is inferior to the Father; and if you ask, whether the bread is ready, the rejoinder is that the genesis of the Son was from Nothing." The Idea of Spirit contained in this doctrine was thus treated in an utterly unspiritual manner. The appointment to the Patriarchate at Constantinople, Antioch and Alexandria, and the jealousy and ambition of the Patriarchs likewise occasioned many intestine struggles. To all these religious contentions was added the interest in the gladiators and their combats, and in the parties of the blue and green color, which likewise occasioned the bloodiest encounters; a sign of the most fearful degradation, as proving that all feeling for what is serious and elevated is lost, and that the delirium of religious passion is quite consistent with an appetite for gross and barbarous spectacles.

The chief points in the Christian religion were at last, by degrees, established by the Councils. The Christians of the Byzantine Empire remained sunk in the dream of superstition – persisting in blind obedience to the Patriarchs and the priesthood. Image-Worship, to which we alluded above, occasioned the most violent struggles and storms. The brave Emperor Leo the Isaurian in particular, persecuted images with the greatest obstinacy, and in the year 754, Image-Worship was declared by a Council to be an invention of the devil. Nevertheless, in the year 787 the Empress Irene had it restored under the authority of a Nicene Council, and the Empress Theodora definitively established it – proceeding against its

enemies with energetic rigor. The iconoclastic Patriarch received two hundred blows, the bishops trembled, the monks exulted, and the memory of this orthodox proceeding was celebrated by an annual ecclesiastical festival. The West, on the contrary, repudiated Image-Worship as late as the year 794, in the Council held at Frankfort; and, though retaining the images, blamed most severely the superstition of the Greeks. Not till the later Middle Ages did Image-Worship meet with universal adoption as the result of quiet and slow advances.

The Byzantine Empire was thus distracted by passions of all kinds *within,* and pressed by the barbarians – to whom the Emperors could offer but feeble resistance – *without.* The realm was in a condition of perpetual insecurity. Its general aspect presents a disgusting picture of imbecility; wretched, nay, insane passions, stifle the growth of all that is noble in thoughts, deeds, and persons. Rebellion on the part of generals, depositions of the Emperors by their means or through the intrigues of the courtiers, assassination or poisoning of the Emperors by their own wives and sons, women surrendering themselves to lusts and abominations of all kinds – such are the scenes which History here brings before us; till at last – about the middle of the fifteenth century (A.D. 1453) – the rotten edifice of the Eastern Empire crumbled in pieces before the might of the vigorous Turks.

PART IV: THE GERMAN WORLD.

THE GERMAN SPIRIT is the Spirit of the new World. Its aim is the realization of absolute Truth as the unlimited self-determination of Freedom – *that* Freedom which has its own absolute form itself as its purport. The destiny of the German peoples is, to be the bearers of the Christian principle. The principle of Spiritual Freedom – of Reconciliation [of the Objective and Subjective], was introduced into the still simple, unformed minds of those peoples; and the part assigned them in the service of the World- Spirit was that of not merely possessing the Idea of Freedom as the substratum of their religious conceptions, but of producing it in free and spontaneous developments from their subjective self-consciousness. In entering on the task of dividing the German World into its natural periods, we must remark that we have not, as was the case in treating of the Greeks and Romans, a double external relation – backwards to an earlier World-Historical people, and forwards to a later one – to guide us. History shows that the process of development among the peoples now under consideration, was an altogether different one. The Greeks and Romans had reached maturity within, ere they directed their energies outwards. The Germans, on the contrary, began with self- diffusion – deluging the world, and overpowering in their course the inwardly rotten, hollow political fabrics of the civilized nations. Only then did their *development* begin, kindled by a foreign culture, a foreign religion, polity and legislation. The process of culture they underwent consisted in taking up foreign elements and reductively amalgamating them with their own national life. Thus their history presents an introversion – the attraction of alien forms of life and the bringing these to bear upon their own. In the Crusades, indeed, and in the

discovery of America, the Western World directed its energies outwards. But it was not thus brought in contact with a World-Historical people that had preceded it; it did not dispossess a principle that had previously governed the world. The relation to an extraneous principle here only *accompanies* [does not *constitute*] the history – does not bring with it essential changes in the nature of those conditions which characterize the peoples in question, but rather wears the aspect of internal evolution. – The relation to other countries and periods is thus entirely different from that sustained by the Greeks and Romans. For the Christian world is the world of completion; the grand principle of being is realized, consequently the end of days is fully come. The Idea can discover in Christianity no point in the aspirations of Spirit that is not satisfied. For its individual members, the Church is, it is true, a preparation for an eternal state as something future; since the units who compose it, in their isolated and several capacity, occupy a position of particularity: but the Church has also the Spirit of God actually present in it, it forgives the sinner and is a present kingdom of heaven. Thus the Christian World has no absolute existence outside its sphere, but only a relative one which is already implicitly vanquished, and in respect to which its only concern is to make it apparent that this conquest has taken place. Hence it follows that an external reference ceases to be the characteristic element determining the epochs of the modern world. We have therefore to look for another principle of division.

The German World took up the Roman culture and religion in their completed form. There was indeed a German and Northern religion, but it had by no means taken deep root in the soul; Tacitus therefore calls the Germans: “Securi adversus Deos.” The Christian Religion which they adopted, had received from Councils and Fathers of the Church, who possessed the whole culture, and in particular, the philosophy of the Greek and Roman World, a perfected dogmatic system; the Church, too, had a

completely developed hierarchy. To the native tongue of the Germans, the Church likewise opposed one perfectly developed – the Latin. In art and philosophy a similar alien influence predominated. What of Alexandrian and of formal Aristotelian philosophy was still preserved in the writings of Boethius and elsewhere, became the fixed basis of speculative thought in the West for many centuries. The same principle holds in regard to the form of the secular sovereignty. Gothic and other chiefs gave themselves the name of Roman Patricians, and at a later date the Roman Empire was restored. Thus the German world appears, superficially, to be only a continuation of the Roman. But there lived in it an entirely *new Spirit,* through which the World was to be regenerated – the free Spirit, viz. which reposes on itself – the absolutely self-determination [Eigensinn] of subjectivity. To this self- involved subjectivity, the corresponding objectivity [Inhalt] stands opposed as absolutely alien. The distinction and antithesis which is evolved from these principles, is that of *Church* and *State.* On the one side, the Church develops itself, as the embodiment of absolute Truth; for it is the consciousness of this truth, and at the same time the agency for rendering the Individual harmonious with it. On the other side stands secular consciousness, which, with its aims, occupies the world of Limitation – the *State,* based on Heart [emotional and thence *social* affections] or mutual confidence and subjectivity generally. European history is the exhibition of the growth of each of these principles severally, in Church and State; then of an antithesis on the part of both – not only of the one to the other, but appearing within the sphere of each of these bodies themselves (since each of them is itself a totality); lastly, of the harmonizing of the antithesis. The *three periods* of this world will have to be treated accordingly.

The *first* begins with the appearance of the German Nations in the Roman Empire – the incipient development of these peoples, converts to

Christianity, and now established in the possession of the West. Their barbarous and simple character prevents this initial period from possessing any great interest. The Christian world then presents itself as "Christendom" – one mass, in which the Spiritual and the Secular form only different aspects. This epoch extends to Charlemagne.

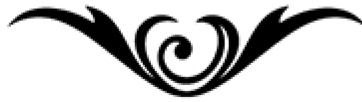
The *second period* develops the two sides of the antithesis to a logically consequential independence and opposition – the Church for itself as a *Theocracy,* and the State for itself as a *Feudal Monarchy.* Charlemagne had formed an alliance with the Holy See against the Lombards and the factions of the nobles in Rome. A union thus arose between the spiritual and the secular power, and a kingdom of heaven on earth promised to follow in the wake of this conciliation. But just at this time, instead of a spiritual kingdom of heaven, the inwardness of the Christian principle wears the appearance of being altogether directed outwards and leaving its proper sphere. Christian Freedom is perverted to its very opposite, both in a religious and secular respect; on the one hand to the severest bondage, on the other hand to the most immoral excess – a barbarous intensity of every passion. In this period two aspects of society are to be especially noticed: the first is the formation of states – superior and inferior suzerainties exhibiting a regulated subordination, so that every relation becomes a firmly-fixed private right, excluding a sense of universality. This regulated subordination appears in the *Feudal System.* The second aspect presents the antithesis of *Church and State.* This antithesis exists solely because the Church, to whose management the Spiritual was committed, itself sinks down into every kind of worldliness – a worldliness which appears only the more detestable, because all passions assume the sanction of religion.

The time of Charles V's reign – *i.e.,* the first half of the sixteenth century – forms the end of the second, and likewise the beginning of the *third period.* Secularity appears now as gaining a consciousness of its intrinsic

worth – becomes aware of its having a value of its own in the morality, rectitude, probity and activity of man. The consciousness of independent validity is aroused through the restoration of Christian freedom. The Christian principle has now passed through the terrible discipline of culture, and it first attains truth and reality through the Reformation, This third period of the German World extends from the Reformation to our own times. The principle of Free Spirit is here made the banner of the World, and from this principle are evolved the universal axioms of Reason. Formal Thought – the Understanding – had been already developed; but Thought received its true material first with the Reformation, through the reviviscent concrete consciousness of Free Spirit. From that epoch Thought began to gain a culture properly its own: principles were derived from it which were to be the norm for the constitution of the State. Political life was now to be consciously regulated by Reason. Customary morality, traditional usage lost its validity; the various claims insisted upon, must prove their legitimacy as based on rational principles. Not till this era is the Freedom of Spirit realized. We may distinguish these periods as Kingdoms of the Father, the Son, and the Spirit. The Kingdom of the Father is the consolidated, undistinguished mass, presenting a self-repeating cycle, mere change – like that sovereignty of Chronos engulfing his offspring. The Kingdom of the Son is the manifestation of God merely in a *relation* to secular existence – shining upon it as upon an alien object. The Kingdom of the Spirit is the harmonizing of the antithesis.

These epochs may be also compared with the earlier empires. In the German aeon, as the realm of Totality, we see the distinct *repetition of the earlier epochs*. Charlemagne's time may be compared with the Persian Empire; it is the period of substantial unity – this unity having its foundation in the inner man, the Heart, and both in the Spiritual and the Secular still abiding in its simplicity.

To the Greek world and its merely *ideal* unity, the time preceding Charles V answers; where *real* unity no longer exists, because all phases of particularity have become fixed in privileges and peculiar rights. As in the interior of the realms themselves, the different estates of the realm, with their several claims, are isolated, so do the various states in their foreign aspects occupy a *merely external* relation to each other. A *diplomatic policy* arises, which in the interest of a European balance of power, unites them *with* and *against* each other. It is the time in which the world becomes clear and manifest to itself (Discovery of America). So too does consciousness gain clearness *in* the supersensuous world and *respecting* it.



Substantial objective religion brings itself to sensuous clearness in the sensuous element (Christian Art in the age of Pope Leo), and also becomes clear to itself in the element of inmost truth. We may compare this time with that of Pericles. The introversion of Spirit begins (Socrates – Luther), though Pericles is wanting in this epoch. Charles V possesses enormous possibilities in point of outward appliances, and appears absolute in his power; but the inner spirit of Pericles, and therefore the absolute means of establishing a free sovereignty, are not in him. This is the epoch when Spirit becomes clear to itself in separations occurring in the realm of reality; now the distinct elements of the German world manifest their essential nature.

The third epoch may be compared with the Roman World. The unity of a universal principle is here quite as decidedly present, yet not as the unity of abstract universal sovereignty, but as the Hegemony of self-cognizant Thought. The authority of Rational Aim is acknowledged, and privileges and particularities melt away before the common object of the State. Peoples will the Right in and for itself; regard is not had exclusively to particular conventions between nations, but principles enter into the considerations with which diplomacy is occupied. As little can Religion maintain itself apart from Thought, but either advances to the

comprehension of the Idea, or, compelled by thought itself, becomes intensive belief – or lastly, from despair of finding itself at home in thought, flees back from it in pious horror, and becomes Superstition.

SECTION I: THE ELEMENTS OF THE CHRISTIAN GERMAN WORLD.

CHAPTER I. THE BARBARIAN MIGRATIONS.

RESPECTING THIS FIRST period, we have on the whole little to say, for it affords us comparatively slight materials for reflection. We will not follow the Germans back into their forests, nor investigate the origin of their migrations. Those forests of theirs have always passed for the abodes of free peoples, and Tacitus sketched his celebrated picture of Germany with a certain love and longing – contrasting it with the corruption and artificiality of that world to which he himself belonged. But we must not on this account regard such a state of barbarism as an exalted one, or fall into some such error as Rousseau's, who represents the condition of the American savages as one in which man is in possession of true freedom. Certainly there is an immense amount of misfortune and sorrow of which the savage knows nothing; but this is a merely negative advantage, while freedom is essential positive. It is only the blessings conferred by affirmative freedom that are regarded as such in the highest grade of consciousness.

Our first acquaintance with the Germans finds each individual enjoying an independent freedom; and yet there is a certain community of feeling and interest, though not yet matured to a political condition. Next we see them inundating the Roman empire. It was partly the fertility of its domains, partly the necessity of seeking other habitations, that furnished the inciting cause. In spite of the wars in which they engage with the Romans, individuals, and even entire clans, enter their service as soldiers. Even so early as the battle of Pharsalia we find German cavalry united with the Roman forces of Caesar. In military service and intercourse with civilized peoples, they became acquainted with their advantages – advantages tending to the enjoyment and convenience of life, but also, and principally,

those of mental cultivation. In the later emigrations, many nations – some entirely, others partially – remained behind in their original abodes.

Accordingly, a distinction must be made between the German nations who remained in their ancient habitations and those who spread themselves over the Roman empire, and mingled with the conquered peoples. Since in their migratory expeditions the Germans attached themselves to their leaders of their own free choice, we find a peculiar duplicate condition of the great Teutonic families (Eastern and Western Goths; Goths in all parts of the world and in their original country; Scandinavians and Normans in Norway, but also appearing as knightly adventurers in the wide world). However different might be the fates of these peoples, they nevertheless had one aim in common – to procure themselves possessions, and to develop themselves in the direction of political organization. This process of growth is equally characteristic of all. In the West – in Spain and Portugal – the Suevi and Vandals are the first settlers, but are subdued and dispossessed by the Visigoths. A great *Visigothic* kingdom was established, to which Spain, Portugal, and a part of Southern France belonged. The second kingdom is that of the *Franks* – a name which, from the end of the second century, was given in common to the Istaevonian races between the Rhine and the Weser. They established themselves between the Moselle and the Scheldt, and under their leader, Clovis, pressed forward into Gaul as far as the Loire. He afterwards reduced the Franks on the Lower Rhine, and the Alemanni on the Upper Rhine; his sons subjugated the Thuringians and Burgundians. The third kingdom is that of the *Ostrogoths* in Italy, founded by Theodoric, and highly nourishing beneath his rule. The learned Romans Cassiodorus and Boëthius filled the highest offices of state under Theodoric. But this Ostrogothic kingdom did not last long; it was destroyed by the Byzantines under Belisarius and Narses. In the second half (568) of the sixth century, the *Lombards* invaded Italy and ruled for two centuries, till this kingdom

also was subjected to the Frank sceptre by Charlemagne. At a later date, the Normans also established themselves in Lower Italy. Our attention is next claimed by the *Burgundians,* who were subjugated by the Franks, and whose kingdom forms a kind of partition wall between France and Germany. The *Angles* and *Saxons* entered Britain and reduced it under their sway. Subsequently, the Normans make their appearance here also. These countries – previously a part of the Roman empire – thus experienced the fate of subjugation by the Barbarians. In the first instance, a great contrast presented itself between the already civilized inhabitants of those countries and the victors; but this contrast terminated in the hybrid character of the new nations that were now formed. The whole mental and moral existence of such states exhibits a divided aspect; in their inmost being we have characteristics that point to an alien origin. This distinction strikes us even on the surface, in their *language,* which is an intermixture of the ancient Roman – already united with the vernacular – and the German. We may class these nations together as *Romanic* – comprehending thereby Italy, Spain, Portugal, and France. Contrasted with these stand three others, more or less *German- speaking* nations, which have maintained a consistent tone of uninterrupted fidelity to native character – Germany itself, Scandinavia, and England. The last was, indeed, incorporated in the Roman empire, but was affected by Roman culture little more than superficially – like Germany itself – and was again Germanized by Angles and Saxons. *Germany Proper* kept itself pure from any admixture; only the southern and western border – on the Danube and the Rhine – had been subjugated by the Romans. The portion between the Rhine and the Elbe remained thoroughly national. This part of Germany was inhabited by several tribes. Besides the Ripuarian Franks and those established by Clovis in the districts of the Maine, four leading tribes – the Alemanni, the Boioarians, the Thuringians, and the Saxons – must be mentioned. The *Scandinavians* retained in their fatherland

a similar purity from intermixture; and also made themselves celebrated by their expeditions, under the name of Normans. They extended their chivalric enterprises over almost all parts of Europe. Part of them went to Russia, and there became the founders of the Russian Empire; part settled in Northern France and Britain; another established principalities in Lower Italy and Sicily. Thus a part of the Scandinavians founded states in foreign lands, another maintained its nationality by the ancestral hearth.

We find, moreover, in the East of Europe, the great *Sclavonic* nation, whose settlements extended west of the Elbe to the Danube. The Magyars (Hungarians) settled in between them. In Moldavia, Wallachia and northern Greece appear the Bulgarians, Servians, and Albanians, likewise of Asiatic origin – left behind as broken barbarian remains in the shocks and counter-shocks of the advancing hordes. These people did, indeed, found kingdoms and sustain spirited conflicts with the various nations that came across their path. Sometimes, as an advanced guard – an intermediate nationality – they took part in the struggle between Christian Europe and unchristian Asia. The Poles even liberated beleaguered Vienna from the Turks; and the Sclaves have to some extent been drawn within the sphere of Occidental Reason. Yet this entire body of peoples remains excluded from our consideration, because hitherto it has not appeared as an independent element in the series of phases that Reason has assumed in the World. Whether it will do so hereafter, is a question that does not concern us here; for in History we have to do with the Past.

The German Nation was characterized by the sense of Natural Totality – an idiosyncrasy which we may call *Heart* [Gemüth]. "Heart" is that undeveloped, indeterminate totality of Spirit, in reference to the Will, in which satisfaction of soul is attained in a correspondingly general and indeterminate way. *Character* is a particular form of will and interest asserting itself; but the quality in question [Gemüthlichkeit] has no

particular aim – riches, honor, or the like; in fact does not concern itself with any *objective* condition [a "position in the world" in virtue of wealth, dignity, etc.] but with the entire condition of the soul – a general sense of enjoyment. Will in the case of such an idiosyncrasy is exclusively *formal* Will – its purely subjective Freedom exhibits itself as self-will. To the disposition thus designated, every particular object of attraction seems important, for "Heart" surrenders itself entirely to each; but as, on the other hand, it is not interested in the quality of such aim in the abstract, it does not become exclusively absorbed in that aim, so as to pursue it with violent and evil passion – does not go the length of abstract vice. In the idiosyncrasy we term "Heart," no such absorption of interest presents itself; it wears, on the whole, the appearance of "well-meaning." *Character* is its direct opposite. This is the abstract principle innate in the German peoples, and that subjective side which they present to the objective in Christianity. "Heart" has no particular object; in Christianity we have the Absolute *Object* [*i.e.,* it is concerned with the entire range of Truth] – all that can engage and occupy human subjectivity. Now it is the desire of satisfaction without further definition or restriction, that is involved in "Heart"; and it is exactly that for which we found an appropriate application in the principle of Christianity. The Indefinite as Substance, in objectivity, is the purely Universal – God; while the reception of the individual will to a participation in His favor, is the complementary element in the Christian concrete Unity. The absolutely Universal is that which contains in it all determinations, and in virtue of this is itself indeterminate. Subject [individual personality] is the absolutely determinate; and these two are identical. This was exhibited above as the material content [Inhalt] in Christianity; here we find it subjectively as "Heart." Subject [Personality] must then also gain an objective form, that is, be expanded to an object. It is necessary that for the indefinite susceptibilty which we designate "Heart," the Absolute also

should assume the form of an Object, in order that man on his part may attain a consciousness of his unity with that object. But this recognition of the Absolute [in Christ] requires the purification of man's subjectivity – requires it to become a real, concrete self, a sharer in general interests as a denizen of the world at large, and that it should act in accordance with large and liberal aims, recognize Law, and find satisfaction in it. – Thus we find here two principles corresponding the one with the other, and recognize the adaptation of the German peoples to be, as we stated above, the bearers of the higher principle of Spirit.

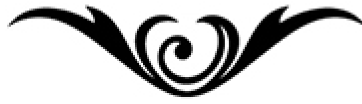
We advance then to the consideration of the German principle in its primary phase of existence, *i.e.* the earliest historical condition of the German nations. Their quality of "Heart" is in its first appearance quite abstract, undeveloped and destitute of any particular object; for substantial aims are not involved in "Heart" itself. Where this susceptibilty stands alone, it appears as a want of character – mere inanity. "Heart" as purely abstract, is dulness; thus we see in the original condition of the Germans a barbarian dulness, mental confusion and vagueness. Of the *Religion* of the Germans we know little. – The Druids belonged to Gaul and were extirpated by the Romans. There was indeed, a peculiar northern mythology; but how slight a hold the religion of the Germans had upon their hearts, has been already remarked, and it is also evident from the fact that the Germans were easily converted to Christianity. The Saxons, it is true, offered considerable resistance to Charlemagne; but this was directed, not so much against the religion he brought with him, as against oppression itself. Their religion had no profundity; and the same may be said of their *ideas* of *law.* Murder was not regarded and punished as a crime: it was expiated by a pecuniary fine. This indicates a deficiency in depth of sentiment – that absence of a power of abstraction and discrimination that marks their peculiar temperament [*Nichtentzweitseyn des Gemuthes*] – a

temperament which leads them to regard it only as an injury to the community when one of its members is killed, and nothing further. The blood- revenge of the Arabs is based on the feeling that the honor of the Family is injured. Among the Germans the community had no dominion over the individual, for the element of freedom is the first consideration in their union in a social relationship. The ancient Germans were famed for their love of freedom; the Romans formed a correct idea of them in this particular from the first. Freedom has been the watchword in Germany down to the most recent times, and even the league of princes under Frederick II had its origin in the love of liberty. This element of freedom, in passing over to a social relationship, can establish only popular communities ; so that these communities constitute the whole state, and every member of the community, as such, is a free man. Homicide could be expiated by a pecuniary mulct, because the individuality of the free man was regarded as sacred – permanently and inviolably – whatever he might have done. The community or its presiding power, with the assistance of members of the community, delivered judgment in affairs of private right, with a view to the protection of person and property. For affairs affecting the body politic at large – for wars and similar contingencies – the whole community had to be consulted. The second point to be observed *is,* that social nuclei were formed by free confederation, and by voluntary attachment to military leaders and princes. The connection in this case was that of *Fidelity;* for Fidelity is the second watchword of the Germans, as Freedom was the first. Individuals attach themselves with free choice to an individual, and without external prompting make this relation an inviolable one. This we find neither among the Greeks nor the Romans. The relation of Agamemnon and the princes who accompanied him was not that of feudal suit and service: it was a free association merely for a *particular purpose* – a Hegemony. But the German confederations have their being not

in a relation to a mere external aim or cause, but in a relation to the spiritual self – the subjective inmost personality. Heart, disposition, the concrete subjectivity in its integrity, which does not attach itself to any abstract bearing of an object, but regards the whole of it as a condition of attachment – making itself dependent on the person *and* the cause – renders this relation a compound of fidelity to a person and obedience to a principle.

The union of the two relations – of individual freedom in the community, and of the bond implied in association – is the main point in the formation of the State. In this, duties and rights are no longer left to arbitrary choice, but are determined as fixed relations; – involving, moreover, the condition that the State be the soul of the entire body, and remain its sovereign – that from it should be derived particular aims and the authorization both of political acts and political agents – the generic character and interests of the community constituting the permanent basis of the whole. But here we have the peculiarity of the German states, that contrary to the view thus presented, social relations do not assume the character of general definitions and laws, but are entirely split up into *private* rights and *private* obligations. They perhaps exhibit a social or communal mould or stamp, but nothing *universal*; the laws are absolutely particular, and the Rights are Privileges. Thus the state was a patchwork of private rights, and a rational political life was the tardy issue of wearisome struggles and convulsions.

We have said, that the Germans were predestined to be the bearers of the Christian principle, and to carry out the Idea as the absolutely Rational aim. In the first instance we have only vague volition, in the background of which lies the True and Infinite. The True is present only as an unsolved problem, for their Soul is not yet purified. A long process is required to complete this purification so as to realize concrete Spirit. Religion comes forward with a challenge to the violence of the passions, and rouses them to madness. The excess of passions is aggravated by evil conscience, and



heightened to an insane rage; which perhaps would not have been the case, had that opposition been absent. We behold the terrible spectacle of the most fearful extravagance of passion in all the royal houses of that period. Clovis, the founder of the Frank Monarchy, is stained with the blackest crimes. Barbarous harshness and cruelty characterize all the succeeding Merovingians; the same spectacle is repeated in the Thuringian and other royal houses. The Christian principle is certainly the problem implicit in their souls; but these are primarily still crude. The Will – potentially true – mistakes itself, and separates itself from the true and proper aim by particular, limited aims. Yet it is in this struggle with itself and contrariety to its bias, that it realizes its wishes; it contends against the object which it really desires, and thus accomplishes it; for implicitly, *potentially,* it is *reconciled.* The Spirit of God lives in the Church; it is the inward impelling Spirit. But it is in the World that Spirit is to be realized – in a material not yet brought into harmony with it. Now this material is the Subjective Will, which thus has a contradiction in itself. On the religious side, we often observe a change of this kind: a man who has all his life been fighting and hewing his way – who with all vehemence of character and passion, has struggled and revelled in secular occupations – on a sudden repudiates it all, to betake himself to religious seclusion. But in the World, secular business cannot be thus repudiated; it demands accomplishment, and ultimately the discovery is made, that Spirit finds the goal of its struggle and its harmonization, in that very sphere which it made the object of its resistance – it finds that *secular pursuits are a spiritual occupation.*

We thus observe, that individuals and peoples regard that which is their misfortune, as their greatest happiness, and conversely, struggle against their happiness as their greatest misery. *La vérité, en la repoussant, on l'embrasse.* Europe comes to the truth while, and to the degree in which, she has repulsed it. It is in the agitation thus occasioned, that Providence

especially exercises its sovereignty; realizing its absolute aim – its honor – as the result of unhappiness, sorrow, private aims and the unconscious will of the nations of the earth.

While, therefore, in the West this long process in the world's history – necessary to that purification by which Spirit in the concrete is realized – is commencing, the purification requisite for developing *Spirit in the abstract* which we observe carried on contemporaneously in the East, is more quickly accomplished. The latter does not need a long process, and we see it produced rapidly, even suddenly, in the first half of the seventh century, in Mahometanism.

CHAPTER II MOHAMETANISM.

ON THE ONE hand we see the *European* world forming itself anew – the nations taking firm root there, to produce a world of free reality expanded and developed in every direction. We behold them beginning their work by bringing all social relations under the form of *particularity* – with dull and narrow intelligence splitting that which in its nature is generic and normal, into a multitude of chance contingencies; rendering that which ought to be simple principle and law, a tangled web of convention, In short, while the West began to shelter itself in a political edifice of chance, entanglement and particularity, the very opposite direction necessarily made its appearance in the world, to produce the balance of the totality of spiritual manifestation. This took place in the *Revolution of the East,* which destroyed all particularity and dependence, and perfectly cleared up and purified the soul and disposition; making the abstract One the absolute object of attention and devotion, and to the same extent, pure subjective consciousness – the Knowledge of this One alone – the only aim of reality; – making the *Unconditioned* [*das Verhältnisslose*] the *condition* [*Verhältniss*] *of existence.*

We have already become acquainted with the nature of the Oriental principle, and seen that its Highest Being is only negative; – that with it the positive imports an abandonment to mere nature – the enslavement of Spirit to the world of realities, Only among the Jews have we observed the principle of pure Unity elevated to a thought; for only among them was adoration paid to the One, as an object of thought. This unity then remained, when the purification of the mind to the conception of abstract Spirit had been accomplished; but it was freed from the particularity by which the

worship of Jehovah had been hampered. Jehovah was only the God of that one people – the God of Abraham, of Isaac and Jacob: only with the Jews had this God made a covenant; only to this people had he revealed himself. That speciality of relation was done away with in Mahometanism. In this spiritual universality, in this unlimited and indefinite purity and simplicity of conception, human personality has no other aim than the realization of this universality and simplicity. *Allah* has not the affirmative, limited aim of the Judaic God. The worship of the One is the only final aim of Mahometanism, and subjectivity has this worship for the sole occupation of its activity, combined with the design to subjugate secular existence to the One. This One has indeed, the quality of Spirit; yet because subjectivity suffers itself to be absorbed in the object, this One is deprived of every concrete predicate; so that neither does subjectivity become on its part spiritually free, nor on the other hand is the object of its veneration concrete. But Mahometanism is not the Hindoo, not the Monastic immersion in the Absolute. Subjectivity is here living and unlimited – an energy which enters into secular life with a purely negative purpose, and busies itself and interferes with the world, only in such a way as shall promote the pure adoration of the One. The object of Mahometan worship is purely intellectual; no image, no representation of Allah is tolerated. Mahomet is a prophet but still man – not elevated above human weaknesses. The leading features of Mahometanism involve this – that in actual existence nothing can become fixed, but that everything is destined to expand itself in activity and life in the boundless amplitude of the world, so that the worship of the One remains the only bond by which the whole is capable of uniting. In this expansion, this active energy, all limits, all national and caste distinctions vanish; no particular race, political claim of birth or possession is regarded – only *man* as a *believer.* To adore the One, to believe in him, to fast – to remove the sense of speciality and consequent

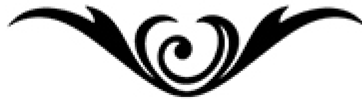
separation from the Infinite, arising from corporeal limitation – and to give alms – that is, to get rid of particular private possession – these are the essence of Mahometan injunctions; but the highest meed is to die for the Faith. He who perishes for it in battle is sure of Paradise.

The Mahometan religion originated among the Arabs. Here Spirit exists in its simplest form, and the sense of the Formless has its especial abode; for in their deserts nothing can be brought into a firm consistent shape. The flight of Mahomet from Mecca in the year 622 is the Moslem era. Even during his life, and under his own leadership, but especially by following up his designs after his death under the guidance of his successors, the Arabs achieved their vast conquests. They first came down upon Syria and conquered its capital Damascus in the year 634. They then passed the Euphrates and Tigris and turned their arms against Persia, which soon submitted to them. In the West they conquered Egypt, Northern Africa and Spain, and pressed into Southern France as far as the Loire, where they were defeated by Charles Martel near Tours, A.D. 732. Thus the dominion of the Arabs extended itself in the West. In the East they reduced successively Persia, as already stated, Samarkand, and the Southwestern part of Asia Minor. These conquests, as also the spread of their religion, took place with extraordinary rapidity. Whoever became a convert to Islam gained a perfect equality of rights with all Mussulmans. Those who rejected it, were, during the earliest period, slaughtered. Subsequently, however, the Arabs behaved more leniently to the conquered; so that if they were unwilling to go over to Islam, they were only required to pay an annual poll-tax. The towns that immediately submitted, were obliged to pay the victor a *tithe* of all their possessions; those which had to be captured, a *fifth.*

Abstraction swayed the minds of the Mahometans. Their object was, to establish an abstract worship, and they struggled for its accomplishment with the greatest enthusiasm. This enthusiasm was *Fanaticism,* that is, an

enthusiasm for something abstract – for an abstract thought which sustains a negative position towards the established order of things. It is the essence of fanaticism to bear only a desolating destructive relation to the concrete; but that of Mahometanism was, at the same time, capable of the greatest elevation – an elevation free from all petty interests, and united with all the virtues that appertain to magnanimity and valor. *La religion et la terreur* were the principles in this case, as with Robespierre *la liberté et la terreur.* But real life is nevertheless concrete, and introduces particular aims; conquest leads to sovereignty and wealth, to the conferring of prerogatives on a dynastic family, and to a union of individuals. But all this is only contingent and built on sand; it is to-day, and to-morrow is not. With all the passionate interest he shows, the Mahometan is really indifferent to this social fabric, and rushes on in the ceaseless whirl of fortune. In its spread Mahometanism founded many kingdoms and dynasties. On this boundless sea there is a continual onward movement; nothing abides firm. Whatever curls up into a form remains all the while transparent, and in that very instant glides away. Those dynasties were destitute of the bond of an organic firmness: the kingdoms, therefore, did nothing but degenerate; the individuals that composed them simply vanished. Where, however, a noble soul makes itself prominent – like a billow in the surging of the sea – it manifests itself in a majesty of freedom, such that nothing more noble, more generous, more valiant, more devoted was ever witnessed. The particular determinate object which the individual embraces is grasped by him entirely – with the whole soul. While Europeans are involved in a multitude of relations, and form, so to speak, “a bundle” of them – in Mahometanism the individual is *one* passion and *that alone*; he is superlatively cruel, cunning, bold, or generous. Where the sentiment of love exists, there is an equal *abandon* – love the most fervid. The ruler who loves the slave, glorifies the object of his love by laying at his feet all his magnificence, power and

honor – forgetting sceptre and throne for him; but on the other hand he will sacrifice him just as recklessly. This reckless fervor shows itself also in the glowing warmth of the Arab and Saracen poetry. That glow is the perfect freedom of fancy from every fetter – an absorption in the life of its object and the sentiment it inspires, so that selfishness and egotism are utterly banished.



Never has enthusiasm, as such, performed greater deeds. Individuals may be enthusiastic for what is noble and exalted in various particular forms. The enthusiasm of a people for its independence, has also a definite aim. But abstract and therefore all-comprehensive enthusiasm – restrained by nothing, finding its limits nowhere, and absolutely indifferent to all beside – is that of the Mahometan East.

Proportioned to the rapidity of the Arab conquests, was the speed with which the arts and sciences attained among them their highest bloom. At first we see the conquerors destroying everything connected with art and science. Omar is said to have caused the destruction of the noble Alexandrian library. "These books," said he, "either contain what is in the Koran, or something else: in either case they are superfluous." But soon afterwards the Arabs became zealous in promoting the arts and spreading them everywhere. Their empire reached the summit of its glory under the Caliphs Al-Mansor and Haroun Al-Raschid. Large cities arose in all parts of the empire, where commerce and manufactures flourished, splendid palaces were built, and schools created. The learned men of the empire assembled at the Caliph's court, which not merely shone outwardly with the pomp of the costliest jewels, furniture and palaces, but was resplendent with the glory of poetry and all the sciences. At first the Caliphs still maintained entire that simplicity and plainness which characterized the Arabs of the desert, (the Caliph Abubeker is particularly famous in this respect,) and which acknowledged no distinction of station and culture. The meanest Saracen,

the most insignificant old Woman, approached the Caliph as an equal. Unreflecting naivete does not stand in need of culture; and in virtue of the freedom of his Spirit, each one sustains a relation of equality to the ruler.

The great empire of the Caliphs did not last long: for on the basis presented by Universality nothing is firm. The great Arabian empire fell about the same time as that of the Franks: thrones were demolished by slaves and by fresh invading hordes – the Seljuks and Mongols – and new kingdoms founded, new dynasties raised to the throne. The Osman race at last succeeded in establishing a firm dominion, by forming for themselves a firm centre in the Janizaries. Fanaticism having cooled down, no moral principle remained in men's souls. In the struggle with the Saracens, European valor had idealized itself to a fair and noble chivalry. Science and knowledge, especially that of philosophy, came from the Arabs into the West. A noble poetry and free imagination were kindled among the Germans by the East – a fact which directed Goethe's attention to the Orient and occasioned the composition of a string of lyric pearls, in his "Divan," which in warmth and felicity of fancy cannot be surpassed. But the East itself, when by degrees enthusiasm had vanished, sank into the grossest vice. The most hideous passions became dominant, and as sensual enjoyment was sanctioned in the first form which Mahometan doctrine assumed, and was exhibited as a reward of the faithful in Paradise, it took the place of fanaticism. At present, driven back into its Asiatic and African quarters, and tolerated only in one corner of Europe through the jealousy of Christian Powers, Islam has long vanished from the stage of history at large, and has retreated into Oriental ease and repose.

CHAPTER III. THE EMPIRE OF CHARLEMAGNE.

THE EMPIRE OF the Franks, as already stated, was founded by Clovis. After his death, it was divided among his sons. Subsequently, after many struggles and the employment of treachery, assassination and violence, it was again united, and once more divided. Internally the power of the kings was very much increased, by their having become princes in *conquered* lands. These were indeed parcelled out among the Frank freemen; but very considerable permanent revenues accrued to the king, together with what had belonged to the emperors, and the spoils of confiscation. These therefore the king bestowed as personal, *i.e.* not heritable, *beneficia,* on his warriors, who in receiving them entered into a personal obligation to him – became his vassals and formed his feudal array. The very opulent Bishops were united with them in constituting the King's Council, which however did not circumscribe the royal authority. At the head of the feudal array was the *Major Domus*. These *Majores Domus* soon assumed the entire power and threw the royal authority into the shade, while the kings sank into a torpid condition and became mere puppets. From the former sprang the dynasty of the Carlovingians. Pepin *le Bref,* the son of Charles Martel, was in the year 752 raised to the dignity of King of the Franks. Pope Zacharias released the Franks from their oath of allegiance to the still living Childeric III – the last of the Merovingians – who received the tonsure, *i.e.* became a monk, and was thus deprived of the royal distinction of long hair. The last of the Merovingians were utter weaklings, who contented themselves with the name of royalty, and gave themselves up almost entirely to luxury – a phenomenon that is quite common in the dynasties of the East, and is also met with again among the last of the Carlovingians. The *Majores Domus,*

on the contrary, were in the very vigor of ascendant fortunes, and were in such close alliance with the feudal nobility, that it became easy for them ultimately to secure the throne.

The Popes were most severely pressed by the Lombard kings and sought protection from the Franks. Out of gratitude Pepin undertook to defend Stephen II. He led an army twice across the Alps, and twice defeated the Lombards. His victories gave splendor to his newly established throne, and entailed a considerable heritage on the Chair of St. Peter. In A.D. 800 the son of Pepin – Charlemagne – was crowned Emperor by the Pope, and hence originated the firm union of the Carlovingians with the Papal See. For the Roman Empire continued to enjoy among the barbarians the prestige of a great power, and was ever regarded by them as the centre from which civil dignities, religion, laws and all branches of knowledge – beginning with written characters themselves – flowed to them. Charles Martel, after he had delivered Europe from Saracen domination, was – himself and his successors – dignified with the title of “Patrician” by the people and senate of Rome; but Charlemagne was crowned Emperor, and that by the Pope himself. There were now, therefore, *two* Empires, and in them the Christian confession was gradually divided into two Churches, the *Greek* and the *Roman.* The Roman Emperor was the born defender of the Roman Church, and this position of the Emperor towards the Pope seemed to declare that the Frank sovereignty was only a continuation of the Roman Empire. The Empire of Charlemagne had a very considerable extent. Franconia Proper stretched from the Rhine to the Loire. Aquitania, south of the Loire, was in 768 – the year of Pepin’s death – entirely subjugated. The Frank Empire also included Burgundy, Alemannia (southern Germany between the Lech, the Maine and the Rhine), Thuringia, which extended to the Saale, and Bavaria. Charlemagne likewise conquered the Saxons, who

dwelt between the Rhine and the Weser, and put an end to the Lombard dominion, so that he became master of Upper and Central Italy.

This great empire Charlemagne formed into a systematically organized State, and gave the Frank dominion settled institutions adapted to impart to it strength and consistency. This must however not be understood, as if he first introduced the *Constitution* of his empire in its whole extent, but as implying that institutions partly already in existence, were developed under his guidance, and attained a more decided and unobstructed efficiency. The King stood at the head of the officers of the empire, and the principle of hereditary monarchy was already recognized. The King was likewise master of the armed force, as also the largest landed proprietor, while the supreme judicial power was equally in his hands. The *military constitution* was based on the "arrière- ban." Every freeman was bound to arm for the defence of the realm, and had to provide for his support in the field for a certain time. This militia (as it would now be called) was under the command of Counts and Margraves, which latter presided over large districts on the borders of the empire – the "Marches." According to the general partition of the country, it was divided into provinces [or counties], over each of which a Count presided. Over them again, under the later Carlovingians, were Dukes, whose seats were large cities, such as Cologne, Ratisbon, and the like. Their office gave occasion to the division of the country into Duchies: thus there was a Duchy of Alsatia, Lorraine, Frisia, Thuringia, Rhaetia. These Dukes were appointed by the Emperor. Peoples that had retained their hereditary princes after their subjugation, lost this privilege and received Dukes, when they revolted; this was the case with Alemannia, Thuringia, Bavaria, and Saxony. But there was also a kind of standing army for readier use. The vassals of the emperor, namely, had the enjoyment of estates on the condition of performing military service, whenever commanded. And with a view to maintain these arrangements,

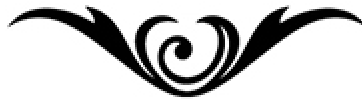
commissioners (Missi) were sent out by the emperor, to observe and report concerning the affairs of the Empire, and to inquire into the state of judicial administration and inspect the royal estates.

Not less remarkable is the management of the *revenues of the state.* There were no direct taxes, and few tolls on rivers and roads, of which several were farmed out to the higher officers of the empire. Into the treasury flowed on the one hand judicial fines, on the other hand the pecuniary satisfactions made for not serving in the army at the emperor's summons. Those who enjoyed *beneficia,* lost them on neglecting this duty. The chief revenue was derived from the crown- lands, of which the emperor had a great number, on which royal palaces [Pfalzen] were erected. It had been long the custom for the kings to make progresses through the chief provinces, and to remain for a time in each palatinate; the due preparations for the maintenance of the court having been already made by Marshals, Chamberlains, etc.

As regards the *administration of justice,* criminal causes and those which concern real property were tried before the communal assemblies under the presidency of a Count. Those of less importance were decided by at least seven free men – an elective bench of magistrates – under the presidency of the Centgraves. The supreme jurisdiction belonged to the royal tribunals, over which the king presided in his palace: to these the feudatories, spiritual and temporal, were amenable. The royal commissioners mentioned above gave especial attention in their inquisitorial visits to the judicial administration, heard all complaints, and punished injustice. A spiritual and a temporal envoy had to go their circuit four times a year.

In Charlemagne's time the ecclesiastical body had already acquired great weight. The bishops presided over great cathedral establishments, with which were also connected seminaries and scholastic institutions. For Charlemagne endeavored to restore science, then almost extinct, by

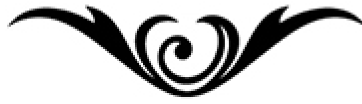
promoting the foundation of schools in towns and villages. Pious souls believed that they were doing a good work and earning salvation by making presents to the church; in this way the most savage and barbarous monarchs sought to atone for their crimes. Private persons most commonly made their offerings in the form of a bequest of their entire estate to religious houses, stipulating for the enjoyment of the usufruct only for life or for a specified time. But it often happened that on the death of a bishop or abbot, the temporal magnates and their retainers invaded the possessions of the clergy, and fed and feasted there till all was consumed; for religion had not yet such an authority over men's minds as to be able to bridle the rapacity of the powerful. The clergy were obliged to appoint stewards and bailiffs to manage their estates; besides this, guardians had charge of all their secular concerns, led their men-at-arms into the field, and gradually obtained from the king territorial jurisdiction, when the ecclesiastics had secured the privilege of being amenable only to their own tribunals, and enjoyed immunity from the authority of the royal officers of justice (the Counts). This involved an important step in the change of political relations, inasmuch as the ecclesiastical domains assumed more and more the aspect of independent provinces enjoying a freedom surpassing anything to which those of secular princes had yet made pretensions. Moreover the clergy contrived subsequently to free themselves from the burdens of the state, and opened the churches and monasteries as asylums – that is, inviolable sanctuaries for all offenders. This institution was on the one hand very beneficial as a protection in cases of violence and oppression; but it was perverted on the other hand into a means of impunity for the grossest crimes. In Charlemagne's time, the law could still demand from conventual authorities the surrender of offenders. The bishops were tried by a judicial bench consisting of bishops; as vassals they were properly subject to the royal tribunal. Afterwards the monastic establishments sought to free



themselves from episcopal jurisdiction also: and thus they made themselves independent even of the church. The bishops were chosen by the clergy and the religious communities at large; but as they were also vassals of the sovereign, their feudal dignity had to be conferred by him. The contingency of a contest was avoided by the obligation to choose a person approved of by the king.

The imperial tribunals were held in the palace where the emperor resided. The sovereign himself presided in them, and the magnates of the imperial court constituted with him the supreme judicial body. The deliberations of the imperial council on the affairs of the empire did not take place at appointed times, but as occasions offered – at military reviews in the spring, at ecclesiastical councils and on court-days. It was especially these court-days, to which the feudal nobles were invited – when the king held his court in a particular province, generally on the Rhine, the centre of the Frank empire – that gave occasion to the deliberations in question. Custom required the sovereign to assemble twice a year a select body of the higher temporal and ecclesiastical functionaries, but here also the king had decisive power. These conventions are therefore of a different character from the Imperial Diets of later times, in which the nobles assume a more independent position.

Such was the state of the Frank Empire – that first consolidation of Christianity into a political form proceeding from itself, the Roman empire having been swallowed up by Christianity. The constitution just described looks excellent; it introduced a firm military organization and provided for the administration of justice within the empire. Yet after Charlemagne's death it proved itself utterly powerless – externally defenceless against the invasions of the Normans, Hungarians, and Arabs, and internally inefficient in resisting lawlessness, spoliation, and oppression of every kind. Thus we see, side by side with an excellent constitution, the most deplorable



condition of things, and therefore confusion in all directions. Such political edifices need, for the very reason that they originate suddenly, the additional strengthening afforded by negativity evolved within themselves: they need reactions in every form, such as manifest themselves in the following period.

SECTION II: THE MIDDLE AGES

WHILE THE *FIRST* period of the German World ends brilliantly with a mighty empire, the *second* is commenced by the reaction resulting from the antithesis occasioned by that infinite falsehood which rules the destinies of the *Middle Ages* and constitutes their life and spirit. This reaction is *first,* that of the particular nationalities against the universal sovereignty of the Frank empire – manifesting itself in the splitting up of that great empire. The *second reaction* is that of individuals against legal authority and the executive power – against subordination, and the military and judicial arrangements of the constitution. This produced the *isolation* and therefore *defencelessness* of individuals. The universality of the power of the state disappeared through this reaction: individuals sought protection with the powerful, and the latter became oppressors. Thus was gradually introduced a condition of universal dependence, and this protecting relation is then systematized into the Feudal System. The *third reaction* is that of the church – the reaction of the spiritual element against the existing order of things. Secular extravagances of passion were repressed and kept in check by the Church, but the latter was itself secularized in the process, and abandoned its proper position. From that moment begins the introversion of the secular principle. These relations and reactions all go to constitute the history of the Middle Ages, and the culminating point of this period is *the Crusades;* for with them arises a universal instability, but one through which the states of Christendom first attain internal and external independence.

CHAPTER I. THE FEUDALITY AND THE HIERARCHY.

THE *FIRST REACTION* is that of particular nationality against the universal sovereignty of the Franks. It appears indeed, at first sight, as if the Frank empire was divided by the mere choice of its sovereigns; but another consideration deserves attention, *vis.* that this division was popular, and was accordingly maintained by the peoples. It was, therefore, not a mere dynastic act – which might appear unwise, since the princes thereby weakened their own power – but a restoration of those distinct nationalities which had been held together by a connecting bond of irresistible might and the genius of a great man. Louis the Pious [*le Débonnaire*] son of Charlemagne, divided the empire among his three sons. But subsequently, by a second marriage, another son was born to him – Charles the Bald. As he wished to give him also an inheritance, wars and contentions arose between Louis and his other sons, whose already received portion would have to be diminished by such an arrangement. In the first instance, therefore, a private interest was involved in the contest; but that of the nations which composed the empire made the issue not indifferent to them. The western Franks had already identified themselves with the Gauls, and with them originated a reaction against the German Franks, as also at a later epoch one on the part of Italy against the Germans. By the treaty of Verdun, A.D. 843, a division of the empire among Charlemagne's descendants took place; the whole Frank empire, some provinces excepted, was for a moment again united under Charles the Gross. It was, however, only for a short time that this weak prince was able to hold the vast empire together; it was broken up into many smaller sovereignties, which developed and maintined an independent position. These were the Kingdom of Italy, which was itself

divided, the two Burgundian sovereignties – Upper Burgundy, of which the chief centres were Geneva and the convent of St. Maurice in Valaise, and Lower Burgundy between the Jura, the Mediterranean and the Rhone – Lorraine, between the Rhine and the Meuse, Normandy, and Brittany. France Proper was shut in between these sovereignties; and thus limited did Hugh Capet find it when he ascended the throne. Eastern Franconia, Saxony, Thuringia, Bavaria, Swabia, remained parts of the German Empire. Thus did the unity of the Frank monarchy fall to pieces. The internal arrangements of the Frank empire also suffered a gradual but total decay; and the first to disappear was the military organization. Soon after Charlemagne we see the Norsemen from various quarters making inroads into England, France and Germany. In England seven dynasties of Anglo-Saxon Kings were originally established, but in the year 827 Egbert united these sovereignties into a single kingdom. In the reign of his successor the Danes made very frequent invasions and pillaged the country. In Alfred the Great's time they met with vigorous resistance, but subsequently the Danish King Canute conquered all England. The inroads of the *Normans* into France were contemporaneous with these events. They sailed up the Seine and the Loire in light boats, plundered the towns, pillaged the convents, and went off with their booty. They beleaguered Paris itself, and the Carlovingian Kings were reduced to the base necessity of purchasing a peace. In the same way they devastated the towns lying on the Elbe; and from the Rhine plundered Aix-la-Chapelle and Cologne, and made Lorraine tributary to them. The Diet of Worms, in 882, did indeed issue a general proclamation, summoning all subjects to rise in arms, but they were compelled to put up with a disgraceful composition. These storms came from the north and the west. The Eastern side of the empire suffered from the inroads of the *Magyars.* These barbarian peoples traversed the country in wagons, and laid waste the whole of Southern Germany. Through

Bavaria, Swabia, and Switzerland they penetrated into the interior of France and reached Italy. The *Saracens* pressed forward from the South. Sicily had been long in their hands: they thence obtained a firm footing in Italy, menaced Rome – which diverted their attack by a composition – and were the terror of Piedmont and Provence.

Thus these three peoples invaded the empire from all sides in great masses, and in their desolating marches almost came into contact with each other. France was devastated by the Normans as far as the Jura; the Hungarians reached Switzerland, and the Saracens Valaise. Calling to mind that organization of the "arrière-ban," and considering it in juxtaposition with this miserable state of things, we cannot fail to be struck with the inefficiency of all those far- famed institutions, which at such a juncture ought to have shown themselves most effective. We might be inclined to regard the picture of the noble and rational constitution of the Frank monarchy under Charlemagne – exhibiting itself as strong, comprehensive, and well ordered, internally and externally – as a baseless figment. Yet it actually existed; the entire political system being held together only by the power, the greatness, the regal soul of this one man – not based on the spirit of the people – not having become a vital element in it. It was superficially induced – an *a priori* constitution like that which Napoleon gave to Spain, and which disappeared with the physical power that sustained it. That, on the contrary, which renders a constitution real, is that it exists as Objective Freedom – the Substantial form of volition – as duty and obligation acknowledged by the subjects themselves. But obligation was not yet recognized by the German Spirit, which hitherto showed itself only as "Heart" and subjective choice; for it there was as yet no subjectivity involving unity, but only a subjectivity conditioned by a careless superficial self-seeking. Thus that constitution was destitute of any firm bond; it had no

objective support in subjectivity; for in fact no constitution was as yet possible.

This leads us to the *Second Reaction* – that of individuals against the authority of law. The capacity of appreciating legal order and the common weal *is* altogether absent, has no vital existence in the peoples themselves. The duties of every free citizen, the authority of the judge to give judicial decisions, that of the count of a province to hold his court, and interest in the laws as such, are no longer regarded as valid now that the strong hand from above ceases to hold the reins of sovereignty. The brilliant administration of Charlemagne had vanished without leaving a trace, and the immediate consequence was the general defencelessness of individuals. The need of protection is sure to be felt in some degree in every well-organized state: each citizen knows his rights and also knows that for the security of possession the social state is absolutely necessary. Barbarians have not yet attained this sense of need – the want of protection from others. They look upon it as a limitation of their freedom if their rights must be guaranteed them by others. Thus, therefore, the impulse towards a firm organization did not exist: men must first be placed in a defenceless condition, before they were sensible of the necessity of the organization of a State. The political edifice had to be reconstructed from the very foundations. The commonwealth as then organized had no vitality or firmness at all either in itself or in the minds of the people; and its weakness manifested itself in the fact that it was unable to give protection to its individual members. As observed above, the idea of duty was not present in the Spirit of the Germans; it had to be restored. In the first instance volition could only be arrested in its wayward career in reference to the merely external point of *possession;* and to make it feel the importance of the protection of the State, it had to be violently dislodged from its obtuseness and impelled by necessity to seek union and a social condition. Individuals

were therefore obliged to consult for themselves by taking refuge with Individuals, and submitted to the authority of certain powerful persons, who constituted a private possession and personal sovereignty out of that authority which formerly belonged to the Commonwealth. As *officers of the State,* the counts did not meet with obedience from those committed to their charge, and they were as little desirous of it. Only for *themselves* did they covet it. They assumed to themselves the power of the State, and made the authority with which they had been intrusted as a *beneficium,* a heritable possession. As in earlier times the King or other magnates conferred fiefs on their vassals by way of rewards, now, conversely, the weaker and poorer surrendered their possessions to the strong, for the sake of gaining efficient protection. They committed their estates to a Lord, a Convent, an Abbot, a Bishop (*feudum oblatum*), and received them back, encumbered with feudal obligations to these superiors. Instead of freemen they became vassals – feudal dependants – and their possession a *beneficium.* This is the constitution of the Feudal System. "*Feudum*" is connected with "*fides*"; the fidelity implied in this case is a bond established on unjust principles, a relation that does indeed contemplate a legitimate object, but whose import is not a whit the less injustice ; for the fidelity of vassals is not an obligation to the Commonwealth, but a private one – *ipso facto* therefore subject to the sway of chance, caprice, and violence. Universal injustice, universal lawlessness is reduced to a system of dependence on and obligation to individuals, so that the mere formal side of the matter, the mere fact of compact constitutes its sole connection with the principle of Right. – Since every man had to protect himself, the martial spirit, which in point of external defence seemed to have most ignominiously vanished, was reawakened; for torpidity was roused to action partly by extreme ill-usage, partly by the greed and ambition of individuals. The valor that now manifested itself, was displayed not on behalf of the State, but of private

interests. In every district arose castles; fortresses were erected, and that for the defence of private property, and with a view to plunder the tyranny. In the way just mentioned, the political totality was ignored at those points where individual authority was established, among which the seats of bishops and archbishops deserve especial mention. The bishoprics had been freed from the jurisdiction of the judicial tribunals, and from the operations of the executive generally. The bishops had stewards on whom at their request the Emperors conferred the jurisdiction which the Counts had formerly exercised. Thus there were detached ecclesiastical domains – ecclesiastical districts which belonged to a saint (Germ. *Weichbilder*). Similar suzerainties of a secular kind were subsequently constituted. Both occupied the position of the previous Provinces [*Gaue*] or Counties [*Grafschaften*]. Only in a few towns where communities of freemen were independently strong enough to secure protection and safety, did relics of the ancient free constitution remain. With these exceptions the free communities entirely disappeared, and became subject to the prelates or to the Counts and Dukes, thenceforth known as seigneurs and princes. The imperial power was extolled in general terms, as something very great and exalted: the Emperor passed for the secular head of entire Christendom: but the more exalted the *ideal* dignity of the emperors, the more limited was it in reality. France derived extraordinary advantage from the fact that it entirely repudiated this baseless assumption, while in Germany the advance of political development was hindered by that pretence of power. The kings and emperors were no longer chiefs of the *state,* but of the *princes,* who were indeed their vassals, but possessed sovereignty and territorial lordships of their own. The whole social condition therefore, being founded on individual sovereignty, it might be supposed that the advance to a State would be possible only through the return of those individual sovereignties to an official relationship. But to accomplish this, a superior power would

have been required, such as was not in existence; for the feudal lords themselves determined how far they were still dependent on the general constitution of the state. No authority of Law and Right is valid any longer; nothing but chance power – the crude caprice of particular as opposed to universally valid Right; and this struggles against equality of Rights and Laws. Inequality of political privileges – the allotment being the work of the purest haphazard – is the predominant feature. It is impossible that a Monarchy can arise from such a social condition through the subjugation of the several minor powers under the Chief of the State, as such. Reversely, the former were gradually transformed into Principalities [*Fürstenthumer*], and became united with the Principality of the Chief; thus enabling the authority of the king and of the state to assert itself. While, therefore, the bond of political unity was still wanting, the several seigneuries attained their development independently.

In France the dynasty of Charlemagne, like that of Clovis, became extinct through the weakness of the sovereigns who represented it. Their dominion was finally limited to the petty sovereignty of Laon; and the last of the Carlovingians, Duke Charles of Lorraine, who laid claim to the crown after the death of Louis V, was defeated and taken prisoner. The powerful Hugh Capet, Duke of France, was proclaimed king. The title of King, however, gave him no real power; his authority was based on his territorial possessions alone. At a later date, through purchase, marriage, and the dying out of families, the kings became possessed of many feudal domains; and their authority was frequently invoked as a protection against the oppressions of the nobles. The royal authority in France became heritable at an early date, because the fiefs were heritable; though at first the kings took the precaution to have their sons crowned during their lifetime. France was divided into many sovereignties: the Duchy of Guienne, the Earldom of Flanders, the Duchy of Gascony, the Earldom of Toulouse, the

Duchy of Burgundy, the Earldom of Vermandois; Lorraine too had belonged to France for some time. Normandy had been ceded to the Normans by the kings of France, in order to secure a temporary repose from their incursions. From Normandy Duke William passed over into England and conquered it in the year 1066. Here he introduced a fully developed feudal constitution – a network which, to a great extent, encompasses England even at the present day. And thus the Dukes of Normandy confronted the comparatively feeble Kings of France with a power of no inconsiderable pretensions. – Germany was composed of the great duchies of Saxony, Swabia, Bavaria, Carinthia, Lorraine and Burgundy, the Margraviate of Thuringia, etc. with several bishoprics and archbishoprics. Each of those duchies again was divided into several fiefs, enjoying more of less independence. The emperor seems often to have united several duchies under his immediate sovereignty. The Emperor Henry III was, when he ascended the throne, lord of many large dukedoms; but he weakened his own power by enfeoffing them to others. Germany was radically a free nation, and had not, as France had, any dominant family as a central authority; it continued an elective empire. Its princes refused to surrender the privilege of choosing their sovereign for themselves; and at every new election they introduced new restrictive conditions, so that the imperial power was degraded to an empty shadow. – In Italy we find the same political condition. The German Emperors had pretensions to it: but their authority was valid only so far as they could support it by direct force of arms, and as the Italian cities and nobles deemed their own advantage to be promoted by submission. Italy was, like Germany, divided into many larger and smaller dukedoms, earldoms, bishoprics and seigneuries. The Pope had very little power, either in the North or in the South; which latter was long divided between the Lombards and the Greeks, until both were overcome by the Normans. – Spain maintained a contest with the Saracens, either

defensive or victorious, through the whole mediaeval period, till the latter finally succumbed to the more matured power of Christian civilization.

Thus all Right vanished before individual Might; for equality of Rights and rational legislation, where the interests of the political Totality, of the State, are kept in view, had no existence. The *Third Reaction,* noticed above, was that of the element of Universality against the Real World as split up into particularity. This reaction proceeded from below upwards – from that condition of isolated possession itself; and was then promoted chiefly by the church. A sense of the *nothingness* of its condition seized on the world as it were universally. In that condition of utter isolation, where only the unsanctioned might of individuals had any validity [where the State was non-existent,] men could find no repose, and Christendom was, so to speak, agitated by the tremor of an evil conscience. In the eleventh century, the fear of the approaching final judgment and the belief in the speedy dissolution of the world, spread through all Europe. This dismay of soul impelled men to the most irrational proceedings. Some bestowed the whole of their possessions on the Church, and passed their lives in continual penance; the majority dissipated their worldly all in riotous debauchery. The Church alone increased its riches by the hallucinations, through donations and bequests. – About the same time too, terrible famines swept away their victims: human flesh was sold in open market. During this state of things, lawlessness, brutal lust, the most barbarous caprice, deceit and cunning, were the prevailing moral features. Italy, the centre of Christendom, presented the most revolting aspect. Every virtue was alien to the times in question; consequently *virtus* had lost its proper meaning: in common use it denoted only violence and oppression, sometimes even libidinous outrage. This corrupt state of things affected the clergy equally with the laity. Their own advowees had made themselves masters of the ecclesiastical estates intrusted to their keeping, and lived on them quite at their own pleasure,

restricting the monks and clergy to a scanty pittance. Monasteries that refused to accept advowees were compelled to do so; the neighboring lords taking the office upon themselves or giving it to their sons. Only bishops and abbots maintained themselves in possession, being able to protect themselves partly by their own power, partly by means of their retainers; since they were, for the most part, of noble families.

The bishoprics being secular fiefs, their occupants were bound to the performance of imperial and feudal service. The investiture of the bishops belonged to the sovereigns, and it was their interest that these ecclesiastics should be attached to them. Whoever desired a bishopric, therefore, had to make application to the king; and thus a regular trade was carried on in bishoprics and abbacies. Usurers who had lent money to the sovereign, received compensation by the bestowal of the dignities in question; the worst of men thus came into possession of spiritual offices. There could be no question that the clergy ought to have been chosen by the religious community, and there were always influential persons who had the right of electing them; but the king compelled them to yield to his orders. Nor did the Papal dignity fare any better. Through a long course of years the Counts of Tusculum near Rome conferred it on members of their own family, or on persons to whom they had sold it for large sums of money. The state of things became at last so intolerable, that laymen as well as ecclesiastics of energetic character opposed its continuance. The Emperor Henry III put an end to the strife of factions, by nominating the Popes himself, and supporting them by his authority in defiance of the opposition of the Roman nobility. Pope Nicholas II decided that the Popes should be chosen by the Cardinals; but as the latter partly belonged to dominant families, similar contests of factions continued to accompany their election. Gregory VII (already famous as Cardinal Hildebrand) sought to secure the independence of the church in this frightful condition of things, by two measures

especially. *First,* he enforced the *celibacy of the clergy.* From the earliest times, it must be observed, the opinion had prevailed that it was commendable and desirable for the clergy to remain unmarried. Yet the annalists and chroniclers inform us that this requirement was but indifferently complied with. Nicholas II had indeed pronounced the married clergy to be a new sect; but Gregory VII proceeded to enforce the restriction with extraordinary energy, excommunicating all the married clergy and all laymen who should hear mass when they officiated. In this way the ecclesiastical body was shut up within itself and excluded from the morality of the State. – His *second* measure was directed against *simony, i.e.* the sale of or arbitrary appointment to bishoprics and to the Papal See itself.

Ecclesiastical offices were thenceforth to be filled by the clergy, who were capable of administering them; an arrangement which necessarily brought the ecclesiastical body into violent collision with secular seigneurs.

These were the two grand measures by which Gregory purposed to emancipate the Church from its condition of dependence and exposure to secular violence. But Gregory made still further demands on the secular power. The transference of benefices to a new incumbent was to receive validity simply in virtue of his ordination by his ecclesiastical superior, and the Pope was to have exclusive control over the vast property of the ecclesiastical community. The Church as a divinely constituted power, laid claim to supremacy over secular authority – founding that claim on the abstract principle that the Divine is superior to the Secular. The Emperor at his coronation – a ceremony which only the Pope could perform – was obliged to promise upon oath that he would always be obedient to the Pope and the Church. Whole countries and states, such as Naples, Portugal, England and Ireland came into a formal relation of vassalage to the Papal chair.

Thus the Church attained an independent position: the Bishops convoked synods in the various countries, and in these convocations the clergy found a permanent centre of unity and support. In this way the Church attained the most influential position in secular affairs. It arrogated to itself the award of princely crowns, and assumed the part of mediator between sovereign powers in war and peace. The contingencies which particularly favored such interventions on the part of the Church were the marriages of princes. It frequently happened that princes wished to be divorced from their wives; but for such a step they needed the permission of the Church. The latter did not let slip the opportunity of insisting upon the fulfilment of demands that might have been otherwise urged in vain, and thence advanced till it had obtained universal influence. In the chaotic state of the community generally, the intervention of the authority of the Church was felt as a necessity. By the introduction of the "Truce of God," feuds and private revenge were suspended for at least certain days in the week, or even for entire weeks; and the Church maintained this armistice by the use of all its ghostly appliances of excommunication, interdict and other threats and penalties. The secular possessions of the Church brought it however into a relation to other secular princes and lords, which was alien to its proper nature; it constituted a formidable secular power in contraposition to them, and thus formed in the first instance a centre of opposition against violence and arbitrary wrong. It withstood especially the attacks upon the ecclesiastical foundations – the secular lordships of the Bishops; and on occasion of opposition on the part of vassals to the violence and caprice of princes, the former had the support of the Pope. But in these proceedings the Church brought to bear against opponents only a force and arbitrary resolve of the same kind as their own, and mixed up its secular interest with its interest as an ecclesiastical, *i.e.,* a divinely substantial power. Sovereigns and peoples were by no means incapable of discriminating between the two,

or of recognizing the worldly aims that were apt to intrude as motives for ecclesiastical intervention. They therefore stood by the Church as far as they deemed it their interest to do so; otherwise they showed no great dread of excommunication or other ghostly terrors. Italy was the country where the authority of the Popes was least respected; and the worst usage they experienced was from the Romans themselves. Thus what the Popes acquired in point of land and wealth and direct sovereignty, they lost in influence and consideration.

We have then to probe to its depths the *spiritual element* in the Church – the form of its power. The essence of the Christian principle has already been unfolded; it is the principle of Mediation. Man realizes his Spiritual essence only when he conquers the Natural that attaches to him. This conquest is possible only on the supposition that the human and the divine nature are essentially one, and that Man, so far as he is Spirit, also possesses the essentiality and substantiality that belong to the idea of Deity. The condition of the mediation in question is the consciousness of this unity; and the intuition of this unity was given to man in Christ. The object to be attained is therefore, that man should lay hold on this consciousness, and that it should be continually excited in him. This was the design of the *Mass:* in the *Host* Christ is set forth as actually, present; the piece of bread consecrated by the priest is the present God, subjected to human contemplation and ever and anon offered up. One feature of this representation is correct, inasmuch as the sacrifice of Christ is here regarded as an actual and eternal transaction, Christ being not a mere sensuous and single, but a completely universal, *i.e.,* divine, *individuum;* but on the other hand it involves the error of isolating the sensuous phase; for the Host is adored even apart from its being partaken of by the faithful, and the presence of Christ is not exclusively limited mental vision and Spirit. Justly therefore did the Lutheran Reformation make this dogma an especial object

of attack. Luther proclaimed the great doctrine that the Host had spiritual value and Christ was received only on the condition of *faith* in him; apart from this, the Host, he affirmed, was a mere external thing, possessed of no greater value than any other thing. But the Catholic falls down before the Host; and thus the merely outward has sanctity ascribed to it. The Holy as a mere thing has the character of externality; thus it is capable of being taken possession of by another to my exclusion: it may come into an alien hand, since the process of appropriating it is not one that takes place in Spirit, but is conditioned by its quality as an external object [*Dingheit*]. The highest of human blessings is in the hands of others. Here arises *ipso facto* a separation between those who possess this blessing and those who have to receive it from others – between the *Clergy* and the *Laity.* The laity as such are alien to the Divine. This is the absolute schism in which the Church in the Middle Ages was involved: it arose from the recognition of the Holy as something external. The clergy imposed certain conditions, to which the laity must conform if they would be partakers of the Holy. The entire development of *doctrine,* spiritual insight and the knowledge of divine things, belonged exclusively to the Church: it has to ordain, and the laity have simply to believe: obedience is their duty – the obedience of faith, without insight on their part. This position of things rendered faith a matter of external legislation, and resulted in compulsion and the stake. The generality of men are thus cut off from the Church; and on the same principle they are severed from the Holy in every form. For on the same principle as that by which the clergy are the medium between man on the one hand and God and Christ on the other hand, the layman cannot directly apply to the Divine Being in his prayers, but only through mediators – human beings who conciliate God for him, the Dead, the Perfect – *Saints.* Thus originated the adoration of the Saints, and with it that conglomerate of fables and falsities with which the Saints and their biographies have been

invested. In the East the worship of images had early become popular, and after a lengthened struggle had triumphantly established itself: – an image, a picture, though sensuous, still appeals rather to the imagination; but the coarser natures of the West desired something more immediate as the object of their contemplation, and thus arose the worship of relics. The consequence was a formal resurrection of the dead in the mediaeval period, every pious Christian wished to be in possession of such sacred earthly remains. Among the Saints the chief object of adoration was the *Virgin Mary.* She is certainly the beautiful concept of pure love – a mother's love; but Spirit and Thought stand higher than even this; and in the worship of this conception that of God in Spirit was lost, and Christ himself was set aside. The element of mediation between God and man was thus apprehended and held as something external. Thus through the perversion of the principle of Freedom, absolute Slavery became the established law. The other aspects and relations of the spiritual life of Europe during this period flow from this principle. Knowledge, comprehension of religious doctrine, is something of which Spirit is judged incapable; it is the exclusive possession of a class, which has to determine the True. For man may not presume to stand in a direct relation to God; so that, as we said before, if he would apply to Him, he needs a mediator – a Saint. This view imports the denial of the essential unity of the Divine and Human; since man, as such, is declared incapable of recognizing the Divine and of approaching thereto. And while humanity is thus separated from the Supreme Good, no change of heart, as such, is insisted upon – for this would suppose that the unity of the Divine and the Human is to be found in man himself – but the terrors of Hell are exhibited to man in the most terrible colors, to induce him to escape from them, not by moral amendment, but in virtue of something external – the "*means of grace*." These, however, are an *arcanum* to the laity; another – the "Confessor,"

must furnish him with them. The individual has to confess – is bound to expose all the particulars of his life and conduct to the view of the Confessor – and then is informed what course he has to pursue to attain spiritual safety. Thus the Church took the place of *Conscience:* it put men in leading strings like children, and told them that man could not be freed from the torments which his sins had merited, by any amendment of his own moral condition, but by outward actions, *opera operata* – actions which were not the promptings of his own good-will, but performed by command of the ministers of the church; *e.g.,* hearing mass, doing penance, going through a certain number of prayers, undertaking pilgrimages – actions which are unspiritual, stupefy the soul, and which are not only mere external ceremonies, but are such as can be even vicariously performed, The supererogatory works ascribed to the saints, could be purchased, and the spiritual advantage which they merited, secured to the purchaser. Thus was produced an utter derangement of all that is recognized as good and moral in the Christian Church: only external requirements are insisted upon, and these can be complied with in a merely external way. A condition the very reverse of Freedom is intruded into the principle of freedom itself.

With this perversion is connected the absolute separation of the spiritual from the secular principle generally. There are two Divine Kingdoms – the intellectual in the heart and cognitive faculty, and the socially ethical whose element and sphere is secular existence. It is science alone that can comprehend the kingdom of God and the socially Moral world as one Idea, and that recognizes the fact that the course of Time has witnessed a process ever tending to the realization of this unity. But Piety [or Religious Feeling] as such, has nothing to do with the Secular: it may make its appearance in that sphere on a mission of mercy, but this stops short of a strict socially ethical connection with it – does not come up to the idea of Freedom. Religious Feeling is extraneous to History, and has no History; for History

is rather the Empire of Spirit recognizing itself in its *Subjective* Freedom, as the economy of social morality [*sittliches Reich*] in the State. In the Middle Ages that embodying of the Divine in actual life was wanting; the antithesis was not harmonized. Social morality was represented as worthless, and that in its *three* most essential particulars.

One phase of social morality is that connected with Love – with the emotions called forth in the *marriage relation.* It is not proper to say that Celibacy is contrary to Nature, but that it is adverse to Social Morality [*Sittlichkeit*]. Marriage was indeed reckoned by the Church among the Sacraments; but notwithstanding the position thus assigned it, it was degraded, inasmuch as celibacy was reckoned as the more holy state. A second point of social morality is presented in *Activity* – the workman has to perform for his subsistence. His dignity consists in his depending entirely on his diligence, conduct, and intelligence, for the supply of his wants. In direct contravention of this principle, *Pauperism,* laziness, inactivity, was regarded as nobler: and the Immoral thus received the stamp of consecration. A *third* point of morality is, that *obedience* be rendered to the Moral and Rational, as an obedience to laws which I recognize as just; that it be not that blind and unconditional compliance which does not know what it is doing, and whose course of action is a mere groping about without clear consciousness or intelligence. But it was exactly this latter kind of obedience that passed for the most pleasing to God; a doctrine that exalts the obedience of Slavery, imposed by the arbitrary will of the Church, above the true obedience of Freedom.

In this way the three vows of Chastity, Poverty, and Obedience turned out the very opposite of what they assumed to be, and in them all social morality was degraded. The Church was no longer a *spiritual* power, but an *ecclesiastical* one; and the relation which the secular world sustained to it was unspiritual, automatic, and destitute of independent insight and

conviction. As the consequence of this, we see everywhere vice, utter absence of respect for conscience, shamelessness, and a distracted state of things, of which the entire history of the period is the picture in detail.

According to the above, the Church of the Middle Ages exhibits itself as a manifold *Self- contradiction.* For Subjective Spirit, although testifying of the Absolute, is at the same time *limited* and definitely existing Spirit, as Intelligence and Will. Its limitation begins in its taking up this distinctive position, and here consentaneously begins its contradictory and self-alienated phase; for that intelligence and will are not imbued with the Truth, which appears in relation to them as something *given* [posited *ab extra*]. This externality of the Absolute Object of comprehension affects the consciousness thus: – that the Absolute Object presents itself as a merely sensuous, external thing – common outward existence – and yet claims to be Absolute: in the mediaeval view of things this absolute demand is made upon Spirit. The second form of the contradiction in question has to do with the relation which the Church itself sustains. The true Spirit exists in man – is *his* Spirit; and the individual gives himself the certainty of this identity with the Absolute, in worship – the Church sustaining merely the relation of a teacher and directress of this worship. But here, on the contrary, we have an ecclesiastical body, like the Brahmins in India, in possession of the Truth – not indeed by birth, but in virtue of knowledge, teaching and training – yet with the proviso that this alone is not sufficient, an external form, an unspiritual title being judged essential to actual possession. This outward form is Ordination, whose nature is such that the consecration imparted inheres essentially like a sensuous quality in the individual, whatever be the character of his soul – be he irreligious, immoral, or absolutely ignorant. The third kind of contradiction is the Church itself, in its acquisition as an outward existence, of possessions and an enormous property – state of

things which, since that Church despises or professes to despise riches, is none other than a Lie.

And we found the State, during the mediaeval period, similarly involved in contradictions. We spoke above of an imperial rule, recognized as standing by the side of the Church and constituting its secular arm. But the power thus acknowledged is invalidated by the fact that the imperial dignity in question is an empty title, not regarded by the Emperor himself or by those who wish to make him the instrument of their ambitious views, as conferring solid authority on its possessor; for passion and physical force assume an independent position, and own no subjection to that merely abstract conception. But *secondly,* the bond of union which holds the Mediaeval State together, and which we call Fidelity, is left to the arbitrary choice of men's disposition [Gemüth] which recognizes no objective duties. Consequently, this Fidelity is the most *unfaithful* thing possible. German Honor in the Middle Ages has become a proverb; but examined more closely as History exhibits it we find it a veritable *Punica fides* or *Groeca fides;* for the princes and vassals of the Emperor are true and honorable only to their selfish aims, individual advantage and passions, but utterly untrue to the Empire and the Emperor; because in "Fidelity" in the abstract, their subjective caprice receives a sanction, and the State is not organized as a moral totality. A *third* contradiction presents itself in the character of individuals, exhibiting, as they do on the one hand, piety – religious devotion, the most beautiful in outward aspect, and springing from the very depths of sincerity – and on the other hand a barbarous deficiency in point of intelligence and will. We find an acquaintance with abstract Truth, and yet the most uncultured, the rudest ideas of the Secular and the Spiritual: a truculent delirium of passion and yet a Christian sanctity which renounces all that is worldly, and devotes itself entirely to holiness. So self-contradictory, so deceptive is this mediaeval period ; and the polemical zeal

with which its excellence is contended for, is one of the absurdities of our times. Primitive barbarism, rudeness of manners, and childish fancy are not revolting; they simply excite our pity. But the highest purity of soul defiled by the most horrible barbarity; the Truth, of which a knowledge has been acquired, degraded to a mere tool by falsehood and self-seeking; that which is most irrational, coarse and vile, established and strengthened by the religious sentiment – this is the most disgusting and revolting spectacle that was ever witnessed, and which only Philosophy can comprehend and so justify. For such an antithesis must arise in man's consciousness of the Holy while this consciousness still remains primitive and immediate; and the profounder the truth to which Spirit comes into an *implicit* relation – while it has not vet become aware of its own presence in that profound truth – so much the more alien is it to itself in this its unknown form: but only as the result of this alienation does it attain its true harmonization.

We have then contemplated the Church as the *reaction* of the Spiritual against the secular life of the time; but this reaction is so conditioned, that it only subjects to itself that against which it reacts – does not reform it. While the Spiritual, repudiating its proper sphere of action, has been acquiring secular power, a secular sovereignty has also consolidated itself and attained a systematic development – the *Feudal System.* As through their isolation, men are reduced to a dependence on their individual power and might, every point in the world on which a human being can maintain his ground becomes an *energetic* one. While the Individual still remains destitute of the defence of laws and is protected only by his own exertion, life, activity and excitement everywhere manifest themselves. As men are certain of eternal salvation through the instrumentality of the Church, and to this end are bound to obey it only in its spiritual requirements, their ardor in the pursuit of worldly enjoyment increases, on the other hand, in inverse proportion to their fear of its producing any detriment to their spiritual weal;

for the Church bestows *indulgences,* when required, for oppressive, violent and vicious actions of all kinds.

The period from the eleventh to the thirteenth century witnessed the rise of an impulse which developed itself in various forms. The inhabitants of various districts began to build enormous churches – Cathedrals, erected to contain the whole community. Architecture is always the first art, forming the inorganic phase, the domiciliation of the divinity; not till this is accomplished does Art attempt to exhibit to the worshippers the divinity himself – the Objective. Maritime commerce was carried on with vigor by the cities on the Italian, Spanish, and Flemish coasts, and this stimulated the productive industry of their citizens at home. The Sciences began in some degree to revive: the Scholastic Philosophy was in its glory. Schools for the study of law were founded at Bologna and other places, as also for that of medicine. It is on the rise and growing importance of the Towns, that all these creations depend as their main condition; a favorite subject of historical treatment in modern times. And the rise of such communities was greatly desiderated. For the Towns, like the Church, present themselves as reactions against feudal violence – as the earliest legally and regularly constituted power. Mention has already been made of the fact that the possessors of power compelled others to put themselves under their protection. Such centres of safety were castles [*Burgen*], churches and monasteries, round which were collected those who needed protection. These now became burghers [*Burger*], and entered into a cliental relation to the lords of such castles or to monastic bodies. Thus a firmly established community was formed in many places. Many cities and fortified places [*Castelle*] still existed in Italy, in the South of France, and in Germany on the Rhine, which dated their existence from the ancient Roman times, and which originally possessed municipal rights, but subsequently lost them

under the rule of feudal governors [*Vögte*]. The citizens, like their rural neighbors, had been reduced to vassalage.

The principle of free possession however began to develop itself from the *protective* relation of feudal protection; *i.e.,* freedom originated in its direct contrary. The feudal lords or great barons enjoyed, properly speaking, no free or absolute possession, any more than their dependents ; they had unlimited power over the latter, but at the same time they also were vassals of princes higher and mightier than themselves, and to whom they were under engagements – which, it must be confessed, they did not fulfil except under compulsion. The ancient Germans had known of none other than free possession; but this principle had been perverted into its complete opposite, and now for the first time we behold the few feeble commencements of a reviving sense of freedom. Individuals brought into closer relation by the soil which they cultivated, formed among themselves a kind of union, confederation, or *conjuratio.* They agreed to be and to perform on their own behalf that which they had previously been and performed in the service of their feudal lord alone. Their first united undertaking was the erection of a tower in which a bell was suspended: the ringing of the bell was a signal for a general rendezvous, and the object of the union thus appointed was the formation of a kind of militia. This is followed by the institution of a municipal government, consisting of magistrates, jurors, consuls, and the establishment of a common treasury, the imposition of taxes, tolls, etc. Trenches are dug and walls built for the common defence, and the citizens are forbidden to erect fortresses for themselves individually. In such a community, handicrafts, as distinguished from agriculture, find their proper home. Artisans necessarily soon attained a superior position to that of the tillers of the ground, for the latter were forcibly driven to work; the former displayed activity really their own, and a corresponding diligence and interest in the result of their labors. Formerly artisans had been obliged to

get permission from their liege lords to sell their work, and thus earn something for themselves: they were obliged to pay them a certain sum for this privilege of market, besides contributing a portion of their gains to the baronial exchequer. Those who had houses of their own were obliged to pay a considerable quit-rent for them; on all that was imported and exported, the nobility imposed large tolls, and for the security afforded to travellers they exacted safe-conduct money. When at a later date these communities became stronger, all such feudal rights were purchased from the nobles, or the cession of them compulsorily extorted: by degrees the towns secured an independent jurisdiction and likewise freed themselves from all taxes, tolls and rents. The burden which continued the longest was the obligation the towns were under to make provision for the Emperor and his whole retinue during his stay within their precincts, as also for seigneurs of inferior rank under the same circumstances. The trading class subsequently divided itself into *guilds,* to each of which were attached particular rights and obligations. The factions to which episcopal elections and other contingencies gave rise, very often promoted the attainment by the towns of the rights above-mentioned. As it would not infrequently happen that two rival bishops were elected to the same see, each one sought to draw the citizens into his own interest, by granting them privileges and freeing them from burdens. Subsequently arose many feuds with the clergy, the bishops and abbots. In some towns they maintained their position as lords of the municipality; in others the citizens got the upper hand, and obtained their freedom. Thus, *e.g.,* Cologne threw off the yoke of its bishop; Mayence on the other hand remained subject. By degrees cities grew to be independent republics: first and foremost in Italy, then in the Netherlands, Germany, and France. They soon come to occupy a peculiar position with respect to the *nobility.* The latter united itself with the corporations of the towns, and constituted as *e.g.,* in Berne, a particular guild. It soon assumed special powers in the

corporations of the towns and attained a dominant position; but the citizens resisted the usurpation and secured the government to themselves. The rich citizens (*populus crassus*) now excluded the nobility from power. But in the same way as the party of the nobility was divided into factions – especially those of Ghibellines and Guelfs, of which the former favored the Emperor, the latter the Pope – that of the citizens also was rent in sunder by intestine strife. The victorious faction was accustomed to exclude its vanquished opponents from power. The *patrician* nobility which supplanted the feudal aristocracy, deprived the common people of all share in the conduct of the state, and thus proved itself no less oppressive than the original noblesse. The history of the cities presents us with a continual change of constitutions, according as one party among the citizens or the other – this faction or that, got the upper hand. Originally a select body of citizens chose the magistrates; but as in such elections the victorious faction always had the greatest influence, no other means of securing impartial functionaries was left, but the election of foreigners to the office of judge and *podésta.* It also frequently happened that the cities chose foreign princes as supreme seigneurs, and intrusted them with the *signoria.* But all of these arrangements were only of short continuance; the princes soon misused their sovereignty to promote their own ambitious designs and to gratify their passions, and in a few years were once more deprived of their supremacy. – Thus the history of these cities presents on the one hand, in individual characters marked by the most terrible or the most admirable features, an astonishingly interesting picture; on the other hand it repels us by assuming, as it unavoidably does, the aspect of mere chronicles. In contemplating the restless and ever-varying impulses that agitate the very heart of these cities and the continual struggles of factions, we are astonished to see on the other side industry – commerce by land and sea – in the highest degree prosperous. It is the same principle of lively vigor,

which, nourished by the internal excitement in question, produces this phenomenon.

We have contemplated the Church, which extended its power over all the sovereignties of the time, and the Cities, where a social organization on a basis of Right was first resuscitated, as powers reacting against the authority of princes and feudal lords. Against these two rising powers, there followed a reactionary movement of princely authority; the Emperor now enters on a struggle with the Pope and the cities. The Emperor is recognized as the apex of Christian, *i.e.* secular power, the Pope on the other hand as that of Ecclesiastical power, which had now however become as decidedly a secular dominion. In theory, it was not disputed that the Roman Emperor was the Head of Christendom – that he possessed the *dominium mundi* – that since all Christian states belonged to the Roman Empire, their princes owed him allegiance in all reasonable and equitable requirements. However satisfied the emperors themselves might be of the validity of this claim, they had too much good sense to attempt seriously to enforce if but the empty title of Roman Emperor was a sufficient inducement to them to exert themselves to the utmost to acquire and maintain it in Italy. The Othos especially cherished the idea of the continuation of the old Roman empire, and were ever and anon summoning the German princes to join them in an expedition to Rome with a view to coronation there; – an undertaking in which they were often deserted by them and had to undergo the shame of a retreat. Equal disappointment was experienced by those Italians who hoped for deliverance at the hands of the Emperor from the ochlocracy that domineered over the cities, or from the violence of the feudal nobility in the country at large. The Italian princes who had invoked the presence of the Emperor and had promised him aid in asserting his claims, drew back and left him in the lurch; and those who had previously expected salvation for their country, then broke out into bitter complaints that their beautiful

country was devastated by barbarians, their superior civilization trodden under foot, and that right and liberty, deserted by the Emperor, must also perish. Especially touching and deep are the lamentations and reproaches which Dante addresses to the Emperors.

The second complication with Italy was that struggle which contemporaneously with the former was sustained chiefly by the great Swabians – the house of *Hohenstaufen* – and whose object was to bring back the secular power of the Church, which had become independent, to its original dependence on the state. The Papal See was also a secular power and sovereignty, and the Emperor asserted the superior prerogative of choosing the Pope and investing him with his secular sovereignty. It was these rights of the State for which the Emperors contended. But to that secular power which they withstood, they were at the same time subject, in virtue of its spiritual pretensions: thus the contest was an interminable contradiction. Contradictory as the varying phases of the contest, in which reconciliation was ever alternating with renewed hostilities, was also the instrumentality employed in the struggle. For the power with which the Emperors made head against their enemy – the princes, their servants and subjects, were divided in their own minds, inasmuch as they were bound by the strongest ties of allegiance to the Emperor and to his enemy at one and the same time. The chief interest of the princes lay in that very assumption of independence in reference to the State, against which on the part of the Papal See the Emperor was contending ; so that they were willing to stand by the Emperor in cases where the empty dignity of the imperial crown was impugned, or on some particular occasions – *e.g.,* in a contest with the cities – but abandoned him when he aimed at seriously asserting his authority against the secular power of the clergy, or against other princes. As, on the one hand, the German emperors sought to realize their title in Italy, so, on the other hand, Italy had its political centre in Germany. The interests of the

two countries were thus linked together, and neither could gain political consolidation within itself. In the brilliant period of the *Hohenstaufen* dynasty, individuals of commanding character sustained the dignity of the throne; sovereigns like Frederick Barbarossa, in whom the imperial power manifested itself in its greatest majesty, and who by his personal qualities succeeded in attaching the subject princes to his interests. Yet brilliant as the history of the Hohenstaufen dynasty may appear, and stirring as might have been the contest with the Church, the former presents on the whole nothing more than the tragedy of this house itself, and the latter had no important result in the sphere of Spirit. The cities were indeed compelled to acknowledge the imperial authority, and their deputies swore to observe the decisions of the Roncalian Diet; but they kept their word no longer than they were compelled to do so. Their sense of obligation depended exclusively on the direct consciousness of a superior power ready to enforce it. It is said that when the Emperor Frederick I asked the deputies of the cities whether they had not sworn to the conditions of peace, they answered: "Yes, but not that we would observe them." The result was that Frederick I at the Peace of Constance (1183) was obliged to concede to them a virtual independence; although he appended the stipulation, that in this concession their feudal obligations to the German Empire were understood to be reserved. The contest between the Emperors and the Popes regarding investitures was settled at the close of 1122 by Henry V and Pope Calixtus II on these terms: the Emperor was to invest with the sceptre; the Pope with the ring and crosier; the chapter were to elect the Bishops in the presence of the Emperor or of imperial commissioners; then the Emperor was to invest the Bishop as a secular feudatory with the *temper alia,* while the ecclesiastical investiture was reserved for the Pope. Thus the protracted contest between the secular and spiritual powers was at length set at rest.

Chapter II. The Crusades.

The Church gained the victory in the struggle referred to in the previous chapter; and in this way secured as decided a supremacy in Germany, as she did in the other states of Europe by a calmer process. She made herself mistress of all the relations of life, and of science and art; and she was the permanent repository of spiritual treasures. Yet notwithstanding this full and complete development of ecclesiastical life, we find a deficiency and consequent craving manifesting itself in Christendom, and which drove it out of itself. To understand this want, we must revert to the nature of the Christian religion itself, and particularly to that aspect of it by which it has a footing in the Present in the consciousness of its votaries.

The objective doctrines of Christianity had been already so firmly settled by the Councils of the Church, that neither the mediaeval nor any other philosophy could develop them further, except in the way of exalting them intellectually, so that they might be satisfactory as presenting the *form* of Thought. And one essential point in this doctrine was the recognition of the Divine Nature as not in any sense an *other-world* existence [ein Jenseits], but as in unity with Human Nature in the Present and Actual. But this Presence is at the same time exclusively Spiritual Presence. Christ as a particular human personality has left the world; his *temporal* existence is only a past one – *i.e.,* it exists only in mental conception. And since the Divine existence on earth is essentially of a spiritual character, it cannot appear in the form of a Dalai-Lama. The Pope, however high his position as Head of Christendom and Vicar of Christ, calls himself only the Servant of Servants. How then did the Church realize Christ as a *definite and present existence?* The principal form of this realization was, as remarked above, the Holy Supper, in the form it presented as the Mass: in this the Life, Suffering, and Death of the actual Christ were verily present, as an eternal and daily repeated sacrifice. Christ appears as a definite and present existence in a sensuous form as the *Host,* consecrated by the Priest; so far

all is satisfactory: that is to say, it is the Church, the Spirit of Christ, that attains in this ordinance direct and full assurance. But the most prominent feature in this sacrament is, that the process by which Deity is manifested, is conditioned by the limitations of particularity – that the Host, this *Thing,* is set up to be adored as God. The Church then might have been able to content itself with this sensuous presence of Deity; but when it is once granted that God exists in external phenomenal presence, this external manifestation immediately becomes infinitely varied; for the need of this presence is infinite. Thus innumerable instances will occur in the experience of the Church, in which Christ has appeared to one and another, in various places; and still more frequently his divine Mother, who as standing nearer to humanity, is a second mediator between the Mediator and man (the miracle-working images of the Virgin are in their way Hosts, since they supply a benign and gracious presence of God). In all places, therefore, there will occur manifestations of the Heavenly, in specially gracious appearances, the stigmata of Christ's Passion, etc.; and the Divine will be realized in *miracles* as detached and isolated phenomena. In the period in question the Church presents the aspect of a world of miracle; to the community of devout and pious persons natural existence has utterly lost its stability and certainty: rather, absolute certainty has turned against it, and the Divine is not conceived of by Christendom under conditions of universality as the law and nature of Spirit, but reveals itself in isolated and detached phenomena, in which the rational form of existence is utterly perverted.

In this complete development of the Church, *we* may find a deficiency: but what can be felt as a want by *it?* What compels *it,* in this state of perfect satisfaction and enjoyment, to wish for something else within the limits of its own principles – without apostatizing from itself? Those miraculous images, places, and times, are only isolated points, momentary appearances

– are not an embodiment of Deity, not of the highest and absolute kind. The Host, the supreme manifestation, is to be found indeed in innumerable churches; Christ is therein transubstantiated to a present and particular existence: but this itself is of a vague and general character; it is not his actual and very presence as particularized in *Space.* That presence has passed away, as regards *time;* but as spatial and as concrete in *space* it has a mundane permanence in this particular spot, this particular village, etc. It is then this mundane existence [in Palestine] which Christendom desiderates, which it is resolved on attaining. Pilgrims in crowds had indeed been able to enjoy it; but the approach to the hallowed localities is in the hands of the Infidels, and it is a reproach to Christendom that the Holy Places and the Sepulchre of Christ in particular are not in possession of the Church. In this feeling Christendom was united; consequently the *Crusades* were undertaken, whose object was not the furtherance of any special interests on the part of the several states that engaged in them, but simply and solely the conquest of the Holy Land.

The West once more sallied forth in hostile array against the East. As in the expedition of the Greeks against Troy, so here the invading hosts were entirely composed of independent feudal lords and knights; though they were not united under a real individuality, as were the Greeks under Agamemnon or Alexander. Christendom, on the contrary, was engaged in an undertaking whose object was the securing of the *definite and present existence* [of Deity] – the real culmination of Individuality. This object impelled the West against the East, and this is the essential interest of the Crusades.

The first and immediate commencement of the Crusades was made in the West itself. Many thousands of Jews were massacred, and their property seized; and after this terrible prelude Christendom began its march. The monk, Peter the Hermit of Amiens, led the way with an immense troop of

rabble. This host passed in the greatest disorder through Hungary, and robbed and plundered as they went; but their numbers dwindled away, and only a few reached Constantinople. For rational considerations were out of the question; the mass of them believed that God would be their immediate guide and protector. The most striking proof that enthusiasm almost robbed the nations of Europe of their senses, is supplied by the fact that at a later time troops of children ran away from their parents, and went to Marseilles, there to take ship for the Holy Land. Few reached it; the rest were sold by the merchants to the Saracens as slaves.

At last, with much trouble and immense loss, more regular armies attained the desired object; they beheld themselves in possession of all the Holy Places of note – Bethlehem, Gethsemane, Golgotha, and even the *Holy Sepulchre.* In the whole expedition – in all the acts of the Christians – appeared that enormous contrast (a feature characteristic of the age) – the transition on the part of the Crusading host from the greatest excesses and outrages to the profoundest contrition and humiliation. Still dripping with the blood of the slaughtered inhabitants of Jerusalem, the Christians fell down on their faces at the tomb of the Redeemer, and directed their fervent supplications to him.

Thus did Christendom come into the possession of its highest good. Jerusalem was made a kingdom, and the entire feudal system was introduced there – a constitution which, in presence of the Saracens, was certainly the worst that could be adopted. Another crusade in the year 1204 resulted in the conquest of Constantinople and the establishment of a Latin Empire there. Christendom, therefore, had appeased its religious craving; it could now veritably walk unobstructed in the footsteps of the Saviour. Whole shiploads of earth were brought from the Holy Land to Europe. Of Christ himself no corporeal relics could be obtained, for he was arisen: the Sacred Handkerchief, the Cross, and lastly the Sepulchre, were the most

venerated memorials. But in the Grave is found the real point of retroversion; it is in the grave that all the vanity of the Sensuous perishes. At the Holy Sepulchre the vanity of [the cherished] opinion passes away [the fancies by which the substance of truth has been obscured disappear] ; there all is seriousness. In the negation of that *definite and present embodiment* – *i.e.,* of the Sensuous – it is that the turning-point in question is found, and those words have an application: “Thou wouldst not suffer thy Holy One to see corruption.” Christendom was not to find its ultimatum of truth in the grave. At this sepulchre the Christian world received a second time the response given to the disciples when they sought the body of the Lord there: “*Why seek ye the living among the dead? He is not here, but is risen*.” You must not look for the principle of your religion in the Sensuous, in the grave among the dead, but in the living Spirit in yourselves. We have seen how the vast idea of the union of the Finite with the Infinite was perverted to such a degree as that men looked for a *definite embodiment* of the Infinite in a mere isolated outward object [the Host]. Christendom found the empty Sepulchre, but not the union of the Secular and the Eternal; and so it lost the Holy Land. It was practically undeceived; and the result which it brought back with it was of a negative kind: viz., that the *definite embodiment* which it was seeking, was to be looked for in *Subjective Consciousness alone,* and in no external object; that the definite form in question, presenting the union of the Secular with the Eternal, is the Spiritual self-cognizant independence of the individual. Thus the world attains the conviction that man must look within himself for that *definite embodiment* of being which is of a divine nature: subjectivity thereby receives absolute authorization, and claims to determine for itself the relation [of all that exists] to the Divine. This then was the absolute result of the Crusades, and from them we may date the commencement of self-reliance and spontaneous activity. The West bade an eternal farewell to the East at the Holy Sepulchre, and gained a

comprehension of its own principle of subjective infinite Freedom. Christendom never appeared again on the scene of history as *one* body.

Crusades of another kind, bearing somewhat the character of wars with a view to mere secular conquest, but which involved a religious interest also, were the contests waged by Spain against the Saracens in the peninsula itself. The Christians had been shut up in a corner by the Arabs; but they gained upon their adversaries in strength, because the Saracens in Spain and Africa were engaged in war in various directions, and were divided among themselves. The Spaniards, united with Frank knights, undertook frequent expeditions against the Saracens; and in this collision of the Christians with the chivalry of the East – with its freedom and perfect independence of soul – the former became also partakers in this freedom. Spain gives us the fairest picture of the knighthood of the Middle Ages, and its hero is the Cid. Several Crusades, the records of which excite our unmixed loathing and detestation, were undertaken against the South of France also. There an aesthetic culture had developed itself: the Troubadours had introduced a freedom of manners similar to that which prevailed under the Hohenstaufen Emperors in Germany; but with this difference, that the former had in it something affected, while the latter was of a more genuine kind. But as in Upper Italy, so also in the South of France fanatical ideas of purity had been introduced; a Crusade was therefore preached against that country by Papal authority. St. Dominic entered it with a vast host of invaders, who, in the most barbarous manner, pillaged and murdered the innocent and the guilty indiscriminately, and utterly laid waste the fair region which they inhabited.

Through the Crusades the Church reached the completion of its authority: it had achieved the perversion of religion and of the divine Spirit; it had distorted the principle of Christian Freedom to a wrongful and immoral slavery of men's souls; and in so doing, far from abolishing lawless caprice and violence and supplanting them by a virtuous rule of its

own, it had even enlisted them in the service of ecclesiastical authority. In the Crusades the Pope stood at the head of the secular power: the Emperor appeared only in a subordinate position, like the other princes, and was obliged to commit both the initiative and the executive to the Pope, as the manifest generalissimo of the expedition. We have already seen the noble house of Hohenstaufen presenting the aspect of chivalrous, dignified and cultivated opponents of the Papal power, when Spirit [the moral and intellectual element in Christendom] had given up the contest. We have seen how they were ultimately obliged to yield to the Church; which, elastic enough to sustain any attack, bore down all opposition and would not move a step towards conciliation. The fall of the Church was not to be effected by open violence; it was from within – by the power of Spirit and by an influence that wrought its way upwards – that ruin threatened it. Respect for the Papacy could not but be weakened by the very fact that the lofty aim of the Crusades – the satisfaction expected from the enjoyment of the sensuous Presence – was not attained. As little did the Popes succeed in keeping possession of the Holy Land. Zeal for the holy cause was exhausted among the princes of Europe. Grieved to the heart by the defeat of the Christians, the Popes again and again urged them to advance to the rescue; but lamentations and entreaties were vain, and they could effect nothing. Spirit, disappointed with regard to its craving for the highest form of the sensuous presence of Deity, fell back upon itself. A rupture, the first of its kind and profound as it was novel, took place. From this time forward we witness religious and intellectual movements in which Spirit – transcending the repulsive and irrational existence by which it is surrounded – either finds its sphere of exercise within itself, and draws upon its own resources for satisfaction, or throws its energies into an actual world of general and morally justified aims, which are therefore aims consonant with Freedom. The efforts thus originated are now to be described: they were the means by

which Spirit was to be prepared to comprehend the grand purpose of its Freedom in a form of greater purity and moral elevation.

To this class of movements belongs in the first place the establishment of monastic and chivalric orders, designed to carry out those rules of life which the Church had distinctly enjoined upon its members. That renunciation of property, riches, pleasures, and free will, which the Church had designated as the highest of spiritual attainments, was to be a reality – not a mere profession. The existing monastic and other institutions that had adopted this vow of renunciation, had been entirely sunk in the corruption of worldliness. But now Spirit sought to realize in the sphere of the principle of negativity – purely in itself – what the Church had demanded. The more immediate occasion of this movement was the rise of numerous heresies in the South of France and Italy, whose tendency was in the direction of enthusiasm; and the unbelief which was now gaining ground, but which the Church justly deemed not so dangerous as those heresies. To counteract these evils, new *monastic orders* were founded, the chief of which was that of the Franciscans, or Mendicant Friars, whose founder, St. Francis of Assisi – a man possessed by an enthusiasm and ecstatic passion that passed all bounds – spent his life in continually striving for the loftiest purity. He gave an impulse of the same kind to his order; the greatest fervor of devotion, the sacrifice of all pleasures in contravention of the prevailing worldliness of the Church, continual penances, the severest poverty (the Franciscans lived on daily alms) – were therefore peculiarly characteristic of it. Contemporaneously with it arose the Dominican order, founded by St. Dominic; its special business was preaching. The mendicant friars were diffused through Christendom to an incredible extent; they were, on the one hand, the standing apostolic army of the Pope, while, on the other hand, they strongly protested against his worldliness. The Franciscans were powerful allies of Louis of Bavaria in his resistance of the Papal

assumptions, and they are said to have been the authors of the position, that a General Council was higher authority than the Pope; but subsequently they too sank down into a torpid and unintelligent condition. In the same way the ecclesiastical *Orders of Knighthood* contemplated the attainment of purity of Spirit. We have already called attention to the peculiar chivalric spirit which had been developed in Spain through the struggle with the Saracens: the same spirit was diffused as the result of the Crusades through the whole of Europe. The ferocity and savage valor that characterized the predatory life of the barbarians – pacified and brought to a settled state by possession, and restrained by the presence of equals – was elevated by religion and then kindled to a noble enthusiasm through contemplating the boundless magnanimity of Oriental prowess. For Christianity also contains the element of boundless abstraction and freedom; the Oriental chivalric spirit found therefore in Occidental hearts a response, which paved the way for their attaining a nobler virtue than they had previously known. Ecclesiastical orders of knighthood were instituted on a basis resembling that of the monastic fraternities. The same conventual vow of renunciation was imposed on their members – the giving up of all that was worldly. But at the same time they undertook the defence of the pilgrims: their first duty therefore was knightly bravery; ultimately, they were also pledged to the sustenance and care of the poor and the sick. The Orders of Knighthood were divided into three: that of St. John, that of the Temple, and the Teutonic Order. These associations are essentially distinguished from the self-seeking principle of feudalism. Their members sacrificed themselves with almost suicidal bravery for a common interest. Thus these Orders transcended the circle of their immediate environment, and formed a network of fraternal coalition over the whole of Europe. But their members sank down to the level of vulgar interests, and the Orders became in the sequel a provisional institute for the nobility generally, rather than anything

else. The Order of the Temple was even accused of forming a religion of its own, and of having renounced Christ in the creed which, under the influence of the Oriental Spirit, it had adopted.

A second impulsion, having a similar origin, was that in the direction of *Science.* The development of Thought – the abstractly Universal – now had its commencement. Those fraternal associations themselves, having a common object, in whose service their members were enlisted, point to the fact that a general principle was beginning to be recognized, and which gradually became conscious of its power. Thought was first directed to Theology, which now became Philosophy under the name of Scholastic Divinity. For philosophy and theology have the Divine as their common object; and although the theology of the Church was a stereotyped dogma, the impulse now arose to justify this body of doctrine in the view of Thought. "When we have arrived at Faith," says the celebrated scholastic, Anselm, "it is a piece of negligence to stop short of convincing ourselves, by the aid of Thought, of that to which we have given credence." But thus conditioned Thought was not free, for its material was already posited *ab extra*; it was to the proof of this material that philosophy devoted its energies. But Thought suggested a variety of questions, the complete answer to which was not given directly in the symbols of the Church; and since the Church had not decided respecting them, they were legitimate subjects of controversy. Philosophy was indeed called an *ancilla fidei,* for it was in subjection to that material of the Church's creed, which had been already definitely settled; but yet it was impossible for the opposition between Thought and Belief not to manifest itself. As Europe presented the spectacle of chivalric contests generally – passages of arms and tournaments – it was now the theatre for intellectual jousting also. It is incredible to what an extent the abstract forms of Thought were developed, and what dexterity was acquired in the use of them. This intellectual

tourneying for the sake of exhibiting skill, and as a diversion (for it was not the doctrines themselves, but only the forms in which they were couched that made the subject of debate), was chiefly prosecuted and brought to perfection in France. France, in fact, began at that time to be regarded as the centre of Christendom : there the scheme of the first Crusades originated, and French armies carried it out: there the Popes took refuge in their struggles with the German emperors and with the Norman princes of Naples and Sicily, and there for a time they made a continuous sojourn. – We also observe in the period subsequent to the Crusades, commencements of Art – of Painting, viz.: even during their continuance a peculiar kind of poetry had made it appearance. Spirit, unable to satisfy its cravings, created for itself by imagination fairer forms and in a calmer and freer manner than the actual world could offer.

CHAPTER III. THE TRANSITION FROM FEUDALISM TO MONARCHY.

THE MORAL PHENOMENA above mentioned, tending in the direction of a general principle, were partly of a subjective, partly of a speculative order. But we must now give particular attention to the practical political movements of the period. The advance which that period witnessed, presents a negative aspect in so far as it involves the termination of the sway of individual caprice and of the isolation of power. Its affirmative aspect is the rise of a supreme authority whose dominion embraces all – a political power properly so called, whose subjects enjoy an equality of rights, and in which the will of the individual is subordinated to that common interest which underlies the whole. This is the advance from Feudalism to *Monarchy.* The principle of feudal sovereignty is the *outward* force of individuals – princes, liege lords; it is a force destitute of *intrinsic* right. The subjects of such a Constitution are vassals of a superior prince or seigneur, to whom they have stipulated duties to perform: but whether they perform these duties or not, depends upon the seigneur's being able to induce them so to do, by force of character or by grant of favors: – conversely, the recognition of those feudal claims themselves was extorted by violence in the first instance; and the fulfilment of the corresponding duties could be secured only by the constant exercise of the power which was the sole basis of the claims in question. The monarchical principle also implies a supreme authority, but it is an authority over persons possessing no independent power to support their individual caprice; where we have no longer caprice opposed to caprice; for the supremacy implied in monarchy is essentially a power emanating from a political body, and is pledged to the

furtherance of that equitable purpose on which the constitution of a state is based. Feudal sovereignty is a polyarchy: we see nothing but Lords and Serfs; in Monarchy, on the contrary, there is one Lord and no Serf, for servitude is abrogated by it, and in it Right and Law are recognized; it is the source of real freedom. Thus in monarchy the caprice of individuals is kept under, and a common gubernatorial interest established. In the suppression of those isolated powers, as also in the resistance made to that suppression, it seems doubtful whether the desire for a lawful and equitable state of things, or the wish to indulge individual caprice, is the impelling motive. Resistance to kingly authority is entitled Liberty, and is lauded as legitimate and noble when the idea of arbitrary will is associated with that authority. But by the arbitrary will of an individual exerting itself so as to subjugate a whole body of men, a community is formed; and comparing this state of things with that in which every point is a centre of capricious violence, we find a much smaller number of points exposed to such violence. The great extent of such a sovereignty necessitates general arrangements for the purposes of organization, and those who govern in accordance with those arrangements are at the same time, in virtue of their office itself, obedient to the state: Vassals become Officers of State, whose duty it is to execute the laws by which the state is regulated. But since this monarchy is developed from feudalism, it bears in the first instance the stamp of the system from which it sprang. – individuals quit their isolated capacity and become members of Estates [or Orders of the Realm] and Corporations; the vassals are powerful only by combination as an Order; in contraposition to them the cities constitute Powers in virtue of their communal existence. Thus the authority of the sovereign inevitably ceases to be mere arbitrary sway. The consent of the Estates and Corporations is essential to its maintenance ; and if the prince wishes to have that consent, he must will what is just and reasonable. We now see a Constitution embracing various Orders, while

Feudal rule knows no such Orders. We observe the transition from feudalism to monarchy taking place in three ways: 1. Sometimes the lord paramount gains a mastery over his independent vassals, by subjugating their individual power – thus making himself sole ruler.

2. Sometimes the princes free themselves from the feudal relation altogether, and become the territorial lords of certain states; or lastly

3. The lord paramount unites the particular lordships that own him as their superior, with his own particular suzerainty, in a more peaceful way, and thus becomes master of the whole.

These processes do not indeed present themselves in history in that pure and abstract form in which they are exhibited here: often we find more modes than one appearing contemporaneously ; but one or the other always predominates. The cardinal consideration is that the basis and essential condition of such a political formation is to be looked for in the *particular nationalities* in which it had its birth. Europe presents particular nations, constituting a unity in their very nature, and having the absolute tendency to form a state. All did not succeed in attaining this political unity: we have now to consider them severally in relation to the change thus introduced. First, as regards the Roman empire, the connection between *Germany* and *Italy* naturally results from the idea of that empire : the secular dominion united with the spiritual was to constitute one whole; but this state of things was rather the object of constant struggle than one actually attained. In Germany and Italy the transition from the feudal condition to monarchy involved the entire abrogation of the former: the vassals became independent monarchs.

Germany had always embraced a great variety of stocks: – Swabians, Bavarians, Franks, Thuringians, Saxons, Burgundians: to these must be added the Sclaves of Bohemia, Germanized Sclaves in Mecklenburg, in Brandenburg, and in a part of Saxony and Austria; so that no such

combination as took place in France was possible. Italy presented a similar state of things. The Lombards had established themselves there, while the Greeks still possessed the Exarchate and Lower Italy: the Normans too established a kingdom of their own in Lower Italy, and the Saracens maintained their ground for a time in Sicily. When the rule of the house of Hohenstaufen was terminated, barbarism got the upper hand throughout Germany; the country being broken up into several sovereignties, in which a forceful despotism prevailed. It was the maxim of the electoral princes to raise only weak princes to the imperial throne; they even sold the imperial dignity to foreigners. Thus the unity of the state was virtually annulled. A number of centres of power were formed, each of which was a predatory state: the legal constitution recognized by feudalism was dissolved, and gave place to undisguised violence and plunder; and powerful princes made themselves lords of the country. After the interregnum the Count of Hapsburg was elected Emperor, and the House of Hapsburg continued to fill the imperial throne with but little interruption. These emperors were obliged to create a force of their own, as the princes would not grant them an adequate power attached to the empire. But that state of absolute anarchy was at last put an end to by associations having general aims in view. In the cities themselves we see associations of a minor order; but now *confederations of cities* were formed with a common interest in the suppression of predatory violence. Of this kind was the *Hanseatic League* in the North, the *Rhenish League* consisting of cities lying along the Rhine, and the *Swabian League.* The aim of all these confederations was resistance to the feudal lords; and even princes united with the cities, with a view to the subversion of the feudal condition and the restoration of a peaceful state of things throughout the country. What the state of society was under feudal sovereignty is evident from the notorious association formed for executing criminal justice: it was a private tribunal, which, under the name of the

Vehmgericht, held secret sittings; its chief seat was the northwest of Germany. A peculiar *peasant association* was also formed. In Germany the peasants were bondmen; many of them took refuge in the towns, or settled down as freemen in the neighborhood of the towns (*Pfahlbürger*); but in Switzerland a peasant fraternity was established. The peasants of Uri, Schwyz, and Unterwalden were under imperial governors; for the Swiss governments were not the property of private possessors, but were official appointments of the Empire. These the sovereigns of the Hapsburg line wished to secure to their own house. The peasants, with club and ironstudded mace [Morgenstern], returned victorious from a contest with the haughty steel-clad nobles, armed with spear and sword, and practised in the chivalric encounters of the tournament. Another invention also tended to deprive the nobility of the ascendancy which they owed to their accoutrements – that of *gunpowder.* Humanity needed it, and it made its appearance forthwith. It was one of the chief instruments in freeing the world from the dominion of physical force, and placing the various orders of society on a level. With the distinction between the weapons they used, vanished also that between lords and serfs. And before gunpowder fortified places were no longer impregnable, so that strongholds and castles now lose their importance. We may indeed be led to lament the decay or the depreciation of the practical value of personal valor – the bravest, the noblest may be shot down by a cowardly wretch at safe distance in an obscure lurking-place; but, on the other hand, gunpowder has made a rational, considerate bravery – Spiritual valor – the essential to martial success. Only through this instrumentality could that superior order of valor be called forth – that valor in which the heat of personal feeling has no share; for the discharge of firearms is directed against a body of men – an abstract enemy, not individual combatants. The warrior goes to meet deadly peril calmly, sacrificing himself for the common weal; and the valor of

cultivated nations is characterized by the very fact, that it does not rely on the strong arm alone, but places its confidence essentially in the intelligence, the generalship, the character of its commanders; and, as was the case among the ancients, in a firm combination and unity of spirit on the part of the forces they command.

In *Italy,* as already noticed, we behold the same spectacle as in Germany – the attainment of an independent position by isolated centres of power. In that country, warfare in the hand of the Condottieri became a regular business. The towns were obliged to attend to their trading concerns, and therefore employed mercenary troops, whose leaders often became feudal lords; Francis Sforza even made himself Duke of Milan. In Florence, the Medici, a family of merchants, rose to power. On the other hand, the larger cities of Italy reduced under their sway several smaller ones and many feudal chiefs. A Papal territory was likewise formed. There, also, a very large number of feudal lords had made themselves independent; by degrees they all became subject to the one sovereignty of the Pope. How thoroughly equitable in the view of social morality such a subjugation was, is evident from Machiavelli's celebrated work "The Prince." This book has often been thrown aside in disgust, as replete with the maxims of the most revolting tyranny; but nothing worse can be urged against it than that the writer, having the profound consciousness of the necessity for the formation of a State, has here exhibited the principles on which alone states could be founded in the circumstances of the times. The chiefs who asserted an isolated independence, and the power they arrogated, must be entirely subdued; and though we cannot reconcile with our idea of Freedom, the means which he proposes as the only efficient ones, and regards as perfectly justifiable – inasmuch as they involve the most reckless violence, all kinds of deception, assassination, and so forth – we must nevertheless confess that the feudal nobility, whose power was to be subdued, were assailable in no

other way, since an indomitable contempt for principle, and an utter depravity of morals, were thoroughly engrained in them.

In *France* we find the converse of that which occurred in Germany and Italy. For many centuries the Kings of France possessed only a very small domain, so that many of their vassals were more powerful than themselves: but it was a great advantage to the royal dignity in France, that the principle of hereditary monarchy was firmly established there. The consideration it enjoyed was increased by the circumstance that the corporations and cities had their rights and privileges confirmed by the king, and that the appeals to the supreme feudal tribunal – the Court of Peers, consisting of twelve members enjoying that dignity – became increasingly frequent. The king's influence was extended by his affording that protection which only the throne could give. But that which essentially secured respect for royalty, even among the powerful vassals, was the increasing personal power of the sovereign. In various ways, by inheritance, by marriage, by force of arms, etc., the Kings had come into possession of many Earldoms [Grafschaften] and several Duchies. The Dukes of Normandy had, however, become Kings of England; and thus a formidable power confronted France, whose interior lay open to it by way of Normandy. Besides this there were powerful Duchies still remaining; nevertheless, the King was not a mere feudal suzerain [Lehnsherr] like the German Emperors, but had become a territorial possessor [Landesherr] : he had a number of barons and cities under him, who were subject to his immediate jurisdiction; and Louis IX succeeded in rendering appeals to the royal tribunal common throughout his kingdom. The towns attained a position of greater importance in the state. For when the king needed money, and all his usual resources – such as taxes and forced contributions of all kinds – were exhausted, he made application to the towns and entered into separate negotiations with them. It was Philip the Fair who, in the year 1302, first convoked the deputies of the towns as a

Third Estate in conjunction with the clergy and the barons. All indeed that they were in the first instance concerned with was the authority of the sovereign as the power that had convoked them, and the raising of taxes as the object of their convocation; but the States nevertheless secured an importance and weight in the kingdom, and as the natural result, an influence on legislation also. A fact which is particularly remarkable is the proclamation issued by the kings of France, giving permission to the bondsmen on the crown lands to purchase their freedom at a moderate price. In the way we have indicated the kings of France very soon attained great power; while the flourishing state of the poetic art in the hands of the Troubadours, and the growth of the scholastic theology, whose especial centre was Paris, gave France a culture superior to that of the other European states, and which secured the respect of foreign nations.

England, as we have already had occasion to mention, was subjugated by William the Conqueror, Duke of Normandy. William introduced the feudal system into it, and divided the kingdom into fiefs, which he granted almost exclusively to his Norman followers. He himself retained considerable crown possessions; the vassals were under obligation to perform service in the field, and to aid in administering justice: the King was the guardian of all vassals under age; they could not marry without his consent. Only by degrees did the barons and the towns attain a position of importance. It was especially in the disputes and struggles for the throne that they acquired considerable weight. When the oppressive rule and fiscal exactions of the Kings became intolerable, contentions and even war ensued: the barons compelled King John to swear to Magna Charta, the basis of English liberty, *i.e.,* more particularly of the privileges of the nobility. Among the liberties thus secured, that which concerns the administration of justice was the chief: no Englishman was to be deprived of personal freedom, property, or life without the judicial verdict of his peers. Every one, moreover, was to be

entitled to the free disposition of his property. Further, the King was to impose no taxes without the consent of the archbishops, bishops, earls, and barons. The towns, also, favored by the Kings in opposition to the barons, soon elevated themselves into a Third Estate and to representation in the Commons' House of Parliament. Yet the King was always very powerful, if he possessed strength of character: his crown estates procured for him due consideration; in later times, however, these were gradually alienated – given away – so that the King was reduced to apply for subsidies to the parliament.

We shall not pursue the minute and specifically historic details that concern the incorporation of principalities with states, or the dissensions and contests that accompanied such incorporations. We have only to add that the kings, when by weakening the feudal constitution, they had attained a higher degree of power, began to use that power against each other in the undisguised interest of their own dominion. Thus France and England carried on wars with each other for a century. The kings were always endeavoring to make foreign conquests; the towns, which had the largest share of the burdens and expenses of such wars, were opposed to them, and in order to placate them the kings granted them important privileges.

The *Popes* endeavored to make the disturbed state of society to which each of these changes gave rise, an occasion for the intervention- of their authority; but the interest of the growth of states was too firmly established to allow them to make their own interest of absolute authority valid against it. Princes and peoples were indifferent to papal clamor urging them to new crusades. The Emperor Louis set to work to deduce from Aristotle, the Bible, and the Roman Law a refutation of the assumptions of the Papal See; and the electors declared at the Diet held at Rense in 1338, and afterwards still more decidedly at the Imperial Diet held at Frankfort, that they would defend the liberties and hereditary rights of the Empire, and that to make the

choice of a Roman Emperor or King valid, no papal confirmation was needed. So, at an earlier date, 1302, on occasion of a contest between Pope Boniface and Philip the Fair, the Assembly of the States convoked by the latter had offered opposition to the Pope. For states and communities had arrived at the consciousness of independent moral worth. – Various causes had united to weaken the papal authority: the Great Schism of the Church, which led men to doubt the Pope's infallibility, gave occasion to the decisions of the Councils of Constance and Basle, which assumed an authority superior to that of the Pope, and therefore deposed and appointed Popes. The numerous attempts directed against the ecclesiastical system confirmed the necessity of a reformation. Arnold of Brescia, Wickliffe, and Huss met with sympathy in contending against the dogma of the papal vicegerency of Christ, and the gross abuses that disgraced the hierarchy. These attempts were, however, only partial in their scope. On the one hand the time was not yet ripe for a more comprehensive onslaught; on the other hand the assailants in question did not strike at the heart of the matter, but (especially the two latter) attacked the teaching of the Church chiefly with the weapons of erudition, and consequently failed to excite a deep interest among the people at large.

But the ecclesiastical principle had a more dangerous foe in the incipient formation of political organizations, than in the antagonists above referred to. A common object, an aim intrinsically possessed of perfect moral validity, presented itself to secularity in the formation of states; and to this aim of community the will, the desire, the caprice of the individual submitted themselves. The hardness characteristic of the selfseeking quality of "Heart," maintaining its position of isolation – the knotty heart of oak underlying the national temperament of the Germans – was broken down and mellowed by the terrible discipline of the Middle Ages. The two iron rods which were the instruments of this discipline were the Church and

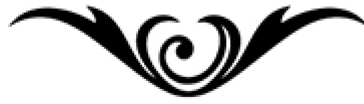
serfdom. The Church drove the "Heart" [Gemüth] to desperation – made Spirit pass through the severest bondage, so that the soul was no longer its own; but it did not degrade it to Hindoo torpor, for Christianity is an intrinsically spiritual principle and, as such, has a boundless elasticity. In the same way serfdom, which made a man's body not his own, but the property of another, dragged humanity through all the barbarism of slavery and unbridled desire, and the latter was destroyed by its own violence. It was not so much *from* slavery as *through* slavery that humanity was emancipated. For barbarism, lust, injustice constitute evil: man, bound fast in its fetters, is unfit for morality and religiousness; and it is from this intemperate and ungovernable state of volition that the discipline in question emancipated him. The Church fought the battle with the violence of rude sensuality in a temper equally wild and terroristic with that of its antagonist: it prostrated the latter by dint of the terrors of hell, and held it in perpetual subjection, in order to break down the spirit of barbarism and to tame it into repose. Theology declares that every man has this struggle to pass through, since he is by nature evil, and only by passing through a state of mental laceration arrives at the certainty of Reconciliation. But granting this, it must on the other hand be maintained, that the form of the contest is very much altered when the conditions of its commencement are different, and when that reconciliation has had an actual realization. The path of torturous discipline is in that case dispensed with (it does indeed make its appearance at a later date, but in a quite different form), for the waking up of consciousness finds man surrounded by the element of a moral state of society. The phase of negation is, indeed, a necessary element -in human development, but it has now assumed the tranquil form of education, so that all the terrible characteristics of that inward struggle vanish.

Humanity has now attained the consciousness of a real internal harmonization of Spirit, and a good conscience in regard to actuality – to

secular existence. The Human Spirit has come to stand on its own basis. In the self-consciousness to which man has thus advanced, there is no revolt against the Divine, but a manifestation of that better subjectivity, which recognizes the Divine in its own being; which is imbued with the Good and True, and which directs its activities to general and liberal objects bearing the stamp of rationality and beauty.

ART AND SCIENCE AS PUTTING A PERIOD TO THE MIDDLE AGES

HUMANITY BEHOLDS ITS spiritual firmament restored to serenity. With that tranquil settling down of the world into political order which we have been contemplating, was conjoined an exaltation of Spirit to a nobler grade of humanity in a sphere involving more comprehensive and concrete interests than that with which political existence is concerned. The Sepulchre – that *caput mortuum* of Spirit – and the Ultramundane cease to absorb human attention. The principle of a specific and definite embodiment of the Infinite – that desideratum which urged the world to the Crusades, now developed itself in a quite different direction, viz. in secular existence asserting an independent ground: Spirit made its embodiment an outward one and found a congenial sphere in the secular life thus originated. The Church, however, maintained its former position, and retained the principle in question in its original form. Yet even in this case, that principle ceased to be limited to a bare outward existence [a sacred *thing,* the Host, *e.g.*]: it was transformed and elevated by *Art.* Art spiritualizes – animates the mere outward and material object of adoration with a form which expresses soul, sentiment, Spirit; so that piety has not a bare sensuous embodiment of the Infinite to contemplate, and does not lavish its devotion on a mere *Thing,* but on the higher element with which the material object is imbued – that expressive form with which *Spirit* has invested it. – It is one thing for the mind to have before it a mere Thing – such as the Host *per se,* a piece of stone or wood, or a wretched daub; – quite another thing for it to contemplate a painting, rich in thought and sentiment, or a beautiful work of sculpture, in looking at which, soul holds

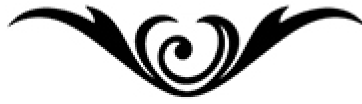


converse with soul and Spirit with Spirit. In the former case, Spirit is torn from its proper element, bound down to something utterly alien to it – the Sensuous, the Non-Spiritual. In the latter, on the contrary, the sensuous object is a beautiful one, and the Spiritual Form with which it is endued, gives it a soul and contains truth in itself. But on the one hand, this element of truth as thus exhibited, is manifested only in a sensuous mode, not in its appropriate form; on the other hand, while Religion normally involves independence of that which is essentially a mere outward and material object – a mere thing – that kind of religion which is now under consideration, finds no satisfaction in being brought into connection with the Beautiful: the coarsest, ugliest, poorest representations will suit its purpose *equally well* – perhaps better. Accordingly real masterpieces – *e.g.* Raphael's Madonnas – do not enjoy distinguished veneration, or elicit a multitude of offerings: inferior pictures seem on the contrary to be especial favorites and to be made the object of the warmest devotion and the most generous liberality. Piety passes by the former for this very reason, that were it to linger in their vicinity it would feel an inward stimulus and attraction; – an excitement of a kind which cannot but be felt to be alien, where all that is desiderated is a sense of mental bondage in which self is lost – the stupor of abject dependence. – Thus Art in its very nature transcended the principle of the Church. But as the former manifests itself only under sensuous limitations [and does not present the suspicious aspect of abstract thought], it is at first regarded as a harmless and indifferent matter. The Church, therefore, continued to follow it; but as soon as the free Spirit in which Art originated, advanced to Thought and Science, a separation ensued.

For Art received a further support and experienced an elevating influence as the result of the *study of antiquity* (the name *humaniora* is very expressive, for in those works of antiquity honor is done to the Human and

to the development of Humanity) : through this study the West became acquainted with the true and eternal element in the activity of man. The outward occasion of this revival of science was the fall of the Byzantine Empire. Large numbers of Greeks took refuge in the West and introduced Greek literature there; and they brought with them not only the knowledge of the Greek language but also the treasures to which that knowledge was the key. Very little of Greek literature had been preserved in the convents, and an acquaintance with the language could scarcely be said to exist at all. With the Roman literature it was otherwise ; in regard to that, ancient traditions still lingered: Virgil was thought to be a great magician (in Dante he appears as the guide in Hell and Purgatory). Through the influence of the Greeks, then, attention was again directed to the ancient Greek literature; the West had become capable of enjoying and appreciating it; quite other ideals and a different order of virtue from that with which mediaeval Europe was familiar were here presented; an altogether novel standard for judging of what was to be honored, commended and imitated was set up. The Greeks in their works exhibited quite other moral commands than those with which the West was acquainted; scholastic formalism had to make way for a body of speculative thought of a widely different complexion: Plato became known in the West, and in him a new human world presented itself. These novel ideas met with a principal organ of diffusion in the newly discovered *Art of Printing,* which, like the use of gunpowder, corresponds with modern character, and supplied the desideratum of the age in which it was invented, by tending to enable men to stand in an ideal connection with each other. So far as the study of the ancients manifested an interest in human deeds and virtues, the Church continued to tolerate it, not observing that in those alien works an altogether alien spirit was advancing to confront it.

As a *third* leading feature demanding our notice in determining the character of the period, might be mentioned that urging of Spirit *outwards* – that desire on the part of man to become acquainted with *his* world. The chivalrous spirit of the maritime heroes of Portugal and Spain opened a new way to the East Indies and discovered America. This progressive step also, involved no transgression of the limits of ecclesiastical principles or feeling. The aim of Columbus was by no means a merely secular one: it presented also a distinctly religious aspect; the treasures of those rich Indian lands which awaited his discovery were destined in his intention to be expended in a new Crusade, and the heathen inhabitants of the countries themselves were to be converted to Christianity. The recognition of the spherical figure of the earth led man to perceive that it offered him a definite and limited object, and navigation had been benefited by the new found instrumentality of the magnet, enabling it to be something better than mere coasting: thus technical appliances make their appearance when a need for them is experienced. These three events – the so-called Revival of Learning, the flourishing of the Fine Arts and the discovery of America and of the passage to India by the Cape – may be compared with that *blush of dawn,* which after long storms first betokens the return of a bright and glorious day. This day is the day of Universality, which breaks upon the world after the long, eventful, and terrible night of the Middle Ages – a day which is distinguished by science, art and inventive impulse – that is, by the noblest and highest, and which Humanity, rendered free by Christianity and emancipated through the instrumentality of the Church, exhibits as the eternal and veritable substance of its being.



SECTION III: THE MODERN TIME.

WE HAVE NOW arrived at the third period of the German World, and thus enter upon the period of Spirit conscious that it is free, inasmuch as it wills the True, the Eternal – that which is in and for itself Universal.

In this third period also, three divisions present themselves. First, we have to consider the *Reformation* in itself – the allenlightening *Sun,* following on that blush of dawn which we observed at the termination of the mediaeval period; next, the unfolding of that state of things which succeeded the Reformation; and lastly, the Modern Times, dating from the end of the last century.

CHAPTER I. THE REFORMATION

THE REFORMATION RESULTED from the *corruption of the Church.* That corruption was not an accidental phenomenon; it was not the mere *abuse* of power and dominion. A corrupt state of things is very frequently represented as an "abuse"; it is taken for granted that the foundation was good – the system, the institution itself faultless – but that the passion, the subjective interest, in short the arbitrary volition of men has made use of that which in itself was good to further its own selfish ends, and that all that is required to be done is to remove these adventitious elements. On this showing the institute in question escapes obloquy, and the evil that disfigures it appears something foreign to it. But when accidental abuse of a good thing really occurs, it is limited to particularity. A great and general corruption affecting a body of such large and comprehensive scope as a Church, is quite another thing. – The corruption of the Church was a native growth; the principle of that corruption is to be looked for in the fact that the specific and definite embodiment of Deity which it recognizes, is sensuous – that the external in a coarse material form, is enshrined in its inmost being. (The refining transformation which Art supplied was not sufficient.) The higher Spirit – that of the World – has already expelled the Spiritual from it; it finds nothing to interest it in the Spiritual or in occupation with it; thus it retains that specific and definite embodiment; – *i.e.,* we have the sensuous immediate subjectivity, not refined by it to Spiritual subjectivity. – Henceforth it occupies a *position of inferiority to the World- Spirit*; the latter has already transcended it, for it has become capable of recognizing the Sensuous as sensuous, the merely outward as merely outward; it has learned to occupy itself with the Finite in a finite

way, and in this very activity to maintain an independent and confident position as a valid and rightful subjectivity.

The element in question which is innate in the Ecclesiastical principle only reveals itself as a corrupting one when the Church has no longer any opposition to contend with – when it has become firmly established. Then its elements are free to display their tendencies without let or hindrance. Thus it is that externality in the Church itself which becomes evil and corruption, and develops itself as a negative principle in its own bosom. – The forms which this corruption assumes are coextensive with the relations which the Church itself sustains, into which consequently this vitiating element enters. The ecclesiastical piety of the period displays the very essence of superstition – the fettering of the mind to a sensuous object, a mere Thing – in the most various forms: – slavish deference to *Authority;* for Spirit, having renounced its proper nature in its most essential quality [having sacrificed its characteristic liberty to a mere sensuous object], has lost its Freedom, and is held in adamantine bondage to what is alien to itself; – a credulity of the most absurd and childish character in regard to *Miracles,* for the Divine is supposed to manifest itself in a perfectly disconnected and limited way, for purely finite and particular purposes; – lastly, lust of power, riotous debauchery, all the forms of barbarous and vulgar corruption, hypocrisy and deception – all this manifests itself in the Church; for in fact the Sensuous in it is not subjugated and trained by the Understanding; it has become free, but only in a rough and barbarous way. – On the other hand the *virtue* which the Church presents, since it is negative only in opposition to sensual appetite, is but abstractly negative; it does not know how to exercise a moral restraint In the indulgence of the senses; in actual life nothing is left for it but avoidance, renunciation, inactivity.

These contrasts which the Church exhibits – of barbarous vice and lust on the one hand, and an elevation of soul that is ready to renounce all worldly things, on the other hand – became still wider in consequence of the energetic position which man is sensible of occupying in his subjective power over outward and material things in the natural world, in which he feels himself free, and so gains for himself an absolute right. – The Church whose office it is to save souls from perdition, makes this salvation itself a mere external appliance, and is now degraded so far as to perform this office in a merely external fashion. The *remission of sins* – the highest satisfaction which the soul craves, the certainty of its peace with God, that which concerns man's deepest and inmost nature – is offered to man in the most grossly superficial and trivial fashion – *to be purchased for mere money;* while the object of this sale is to procure means for dissolute excess. One of the objects of this sale was indeed the building of St. Peter's, that magnificent chef-d'oeuvre of Christian fabrics erected in the metropolis of religion. But, as that paragon of works of art, the Athene and her temple-citadel at Athens, was built with the money of the allies and issued in the loss of both allies and power; so the completion of this Church of St. Peter and Michael Angelo's "Last Judgment" in the Sistine Chapel, were the Doomsday and the ruin of this proud spiritual edifice.

The time-honored and cherished *sincerity of the German people* is destined to effect this revolution out of the honest truth and simplicity of its heart. While the rest of the world are urging their way to India, to America – straining every nerve to gain wealth and to acquire a secular dominion which shall encompass the globe, and on which the sun shall never set – we find a simple *Monk* looking for that specific embodiment of Deity which Christendom had formerly sought in an earthly sepulchre of stone, rather in the deeper abyss of the Absolute Ideality of all that is sensuous and external – in the Spirit and the Heart – the heart, which, wounded unspeakably by

the offer of the most trivial and superficial appliances to satisfy the cravings of that which is inmost and deepest, now detects the perversion of the absolute relation of truth in its minutest features, and pursues it to annihilation. Luther's simple doctrine is that the specific embodiment of Deity – infinite subjectivity, that is true spirituality, Christ – is in no way present and actual in an outward form, but as essentially spiritual is obtained only in being reconciled to God – *in faith and spiritual enjoyment.* These two words express everything. That which this doctrine desiderates, is not the recognition of a sensuous object as God, nor even of something merely conceived, and which is not actual and present, but of a Reality that is not sensuous. This abrogation of externality imports the reconstruction of all the doctrines, and the reform of all the superstition into which the Church consistently wandered, and in which its spiritual life was dissipated. This change especially, affects the doctrine of works; for works include what may be performed under any mental conditions – not necessarily in faith, in one's own soul, but as mere external observances prescribed by authority. Faith is by no means a bare assurance respecting mere finite things – an assurance which belongs only to limited mind – as *e.g.,* the belief that such or such a person existed and said this or that; or that the Children of Israel passed dry-shod through the Red Sea – or that the trumpets before the walls of Jericho produced as powerful an impression as our cannons; for although nothing of all this had been related to us, our knowledge of God would not be the less complete. In fact it is not a belief in something that is absent, past and gone, but the subjective assurance of the Eternal, of Absolute Truth, the Truth of God. Concerning this assurance, the Lutheran Church affirms that the Holy Spirit alone produces it – *i.e.,* that it is an assurance which the individual attains, not in virtue of his particular idiosyncrasy, but of his essential being. – The Lutheran doctrine therefore involves the entire substance of Catholicism, with the exception of

all that results from the element of externality – as far as the Catholic Church insists upon that externality. Luther therefore could not do otherwise than refuse to yield an iota in regard to that doctrine of the Eucharist in which the whole question is concentrated. Nor could he concede to the Reformed [Calvinistic] Church, that Christ is a mere commemoration, a mere reminiscence: in this respect his view was rather in accordance with that of the Catholic Church, viz. that Christ is an actual presence, though only in faith and in Spirit. He maintained that the Spirit of Christ really fills the human heart – that Christ therefore is not to be regarded as merely a historical person, but that man sustains *an immediate relation to him in Spirit.*

While, then, the individual knows that he is filled with the Divine Spirit, all the relations that sprung from that vitiating element of externality which we examined above, are *ipso facto* abrogated: there is no longer a distinction between priests and laymen; we no longer find one class in possession of the substance of the Truth, as of all the spiritual and temporal treasures of the Church; but the heart – the emotional part of man's Spiritual nature – is recognized as that which can and ought to come into possession of the Truth; and this subjectivity is the common property of *all mankind.* Each has to accomplish the work of reconciliation in his own soul. – Subjective Spirit has to receive the Spirit of Truth into itself, and give it a dwelling place there. Thus that absolute inwardness of soul which pertains to religion itself, and Freedom in the Church are both secured. Subjectivity therefore makes the objective purport of Christianity, *i.e.* the doctrine of the Church, its own. In the Lutheran Church the subjective feeling and the conviction of the individual is regarded as equally necessary with the objective side of Truth. Truth with Lutherans is not a finished and completed thing; the subject himself must be imbued with Truth, surrendering his particular being in exchange for the substantial Truth, and

making that Truth his own. Thus subjective Spirit gains emancipation in the Truth, abnegates its particularity and comes to itself in realizing the truth of its being. Thus Christian Freedom is actualized. If Subjectivity be placed in feeling only, without that objective side, we have the standpoint of the merely Natural Will.

In the proclamation of these principles is unfurled the new, the latest standard round which the peoples rally – the banner of *Free Spirit,* independent, though finding its life in the Truth, and enjoying independence only in it. This is the banner under which we serve, and which we bear. Time, since that epoch, has had no other work to do than the formal imbuing of the world with this principle, in bringing the Reconciliation implicit [in Christianity] into objective and explicit realization.

Culture is essentially concerned with Form; the work of Culture is the production of the Form of Universality, which is none other than Thought. Consequently Law, Property, Social Morality, Government, Constitutions, etc., must be conformed to general principles, in order that they may accord with the idea of Free Will and be Rational. Thus only can the Spirit of Truth manifest itself in Subjective Will – in the particular shapes which the activity of the Will assumes. In virtue of that degree of intensity which Subjective Free Spirit has attained, elevating it to the form of Universality, Objective Spirit attains manifestation. This is the sense in which we must understand the State to be based on Religion. States and Laws are nothing else than Religion manifesting itself in the relations of the actual world. This is the essence of the Reformation: Man is in his very nature destined to be free.

At its commencement, the Reformation concerned itself only with particular aspects of the Catholic Church: Luther wished to act in union with the whole Catholic world, and expressed a desire that Councils should be convened. His theses found supporters in every country. In answer to the

charge brought against Luther and the Protestants, of exaggeration – nay, even of calumnious misrepresentation in their descriptions of the corruption of the Church, we may refer to the statements of Catholics themselves, bearing upon this point, and particularly to those contained in the official documents of Ecclesiastical Councils. But Luther's onslaught, which was at first limited to particular points, was soon extended to the doctrines of the Church; and leaving individuals, he attacked institutions at large – conventual life, the secular lordships of the bishops, etc. His writings now controverted not merely isolated dicta of the Pope and the Councils, but the very principle on which such a mode of deciding points in dispute was based – in fact, *the Authority of the Church.* Luther repudiated that authority, and set up in its stead the *Bible* and the testimony of the Human Spirit. And it is a fact of the weightiest import that the Bible has become the basis of the Christian Church: henceforth each individual enjoys the right of deriving instruction for himself from it, and of directing his conscience in accordance with it. We see a vast change in the principle by which man's religious life is guided: the whole system of Tradition, the whole fabric of the Church becomes problematical, and its authority is subverted. Luther's translation of the Bible has been of incalculable value to the German people. It has supplied them with a People's Book, such as no nation in the Catholic world can boast; for though the latter have a vast number of minor productions in the shape of prayer books, they have no generally recognized and classical book for popular instruction. In spite of this it has been made a question in modern times whether it is judicious to place the Bible in the hands of the People. Yet the few disadvantages thus entailed are far more than counterbalanced by the incalculable benefits thence accruing: narratives, which in their external shape might be repellent to the heart and understanding, can be discriminatingly treated by the religious sense, which, holding fast the substantial truth, easily vanquishes any such

difficulties. And even if the books which have pretensions to the character of People's Books, were not so superficial as they are, they would certainly fail in securing that respect which a book claiming such a title ought to inspire in *individuals*. But to obviate this difficulty is no easy matter, for even should a book adapted to the purpose in every other respect be produced, every country parson would have some fault to find with it, and think to better it. In France the need of such a book has been very much felt; great premiums have been offered with a view to obtaining one, but, from the reason stated, without success. Moreover, the existence of a People's Book presupposes as its primary condition an ability to read on the part of the People; an ability which in Catholic countries is not very commonly to be met with.

The denial of the Authority of the Church necessarily led to a separation. The *Council of Trent* stereotyped the principles of Catholicism, and made the restoration of concord impossible. Leibnitz at a later time discussed with Bishop Bossuet the question of the union of the Churches; but the Council of Trent remains the insurmountable obstacle. The *Churches* became hostile *parties,* for even in respect to secular arrangements a striking difference manifested itself. In the non-Catholic countries the conventual establishments and episcopal foundations were broken up, and the rights of the then proprietors ignored. Educational arrangements were altered; the fasts and holy days were abolished. Thus there was also a secular reform – a change affecting the state of things outside the sphere of ecclesiastical relations: in many places a rebellion was raised against the temporal authorities. In Münster the Anabaptists expelled the Bishop and established a government of their own; and the peasants rose *en masse* to emancipate themselves from the yoke of serfdom. But the world was not yet ripe for a transformation of its political condition as a consequence of ecclesiastical reformation. – The Catholic Church also was essentially influenced by the

Reformation: the reins of discipline were drawn tighter, and the greatest occasions of scandal, the most crying abuses were abated. Much of the intellectual life of the age that lay outside its sphere, but with which it had previously maintained friendly relations, it now repudiated. The Church came to a dead stop – "hitherto and no farther!" It severed itself from advancing Science, from philosophy and humanistic literature; and an occasion was soon offered of declaring its enmity to the scientific pursuits of the period. The celebrated Copernicus had discovered that the earth and the planets revolve round the sun, but the Church declared against this addition to human knowledge. Galileo, who had published a statement in the form of a dialogue of the evidence for and against the Copernican discovery (declaring indeed his own conviction of its truth), was obliged to crave pardon for the offence on his knees. The Greek literature was not made the basis of culture; education was intrusted to the Jesuits. Thus does the Spirit of the Catholic world in general sink behind the Spirit of the Age.

Here an important question solicits investigation: – why the Reformation was limited to certain nations, and why it did not permeate the whole Catholic world. The Reformation originated in Germany, and struck firm root only in the purely German nations; outside of Germany itself it established itself in Scandinavia and England. But the Romanic and Sclavonic nations kept decidedly aloof from it. Even South Germany has only partially adopted the Reformation – a fact which is consistent with the mingling of elements which is the general characteristic of its nationality. In Swabia, Franconia, and the Rhine countries there were many convents and bishoprics, as also many free imperial towns; and the reception or rejection of the Reformation very much depended on the influences which these ecclesiastical and civil bodies respectively exercised ; for we have already noticed that the Reformation was a change influencing the political life of the age as well as its religious and intellectual condition. We must further

observe, that authority has much greater weight in determining men's opinions than people are inclined to believe. There are certain fundamental principles which men are in the habit of receiving on the strength of authority; and it was mere authority which in the case of many countries decided for or against the adoption of the Reformation. In Austria, in Bavaria, in Bohemia, the Reformation had already made great progress; and though it is commonly said that when truth has once penetrated men's souls, it cannot be rooted out again, it was indisputably stifled in the countries in question, by force of arms, by stratagem or persuasion. The *Sclavonic nations* were *agricultural.* This condition of life brings with it the relation of lord and serf. In agriculture the agency of nature predominates; human industry and subjective activity are on the whole less brought into play in this department of labor than elsewhere. The Sclavonians therefore did not attain so quickly or readily as other nations the fundamental sense of pure individuality – the consciousness of Universality – that which we designated above as "political power," and could not share the benefits of dawning freedom. – But the *Romanic nations* also – Italy, Spain, Portugal, and in part France – were not imbued with the Reformed doctrines. Physical force perhaps did much to repress them; yet this alone would not be sufficient to explain the fact, for when the Spirit of a Nation craves anything no force can prevent its attaining the desired object: nor can it be said that these nations were deficient in culture; on the contrary, they were in advance of the Germans in this respect. It was rather owing to the fundamental character of these nations, that they did not adopt the Reformation. But what is this peculiarity of character which hindered the attainment of Spiritual Freedom? We answer: the pure inwardness of the German nation was the proper soil for the emancipation of Spirit; the Romanic Nations, on the contrary, have maintained in the very depth of their soul – in their Spiritual Consciousness – the principle of *Disharmony*:

they are a product of the fusion of Roman and German blood, and still retain the heterogeneity thence resulting. The German cannot deny that the French, the Italians, the Spaniards, possess more determination of character – that they pursue a settled aim (even though it have a fixed idea for its object) with perfectly clear consciousness and the greatest attention – that they carry out a plan with great circumspection, and exhibit the greatest decision in regard to specific objects. The French call the Germans *entiers*, "entire" – *i.e.,* stubborn; they are also strangers to the whimsical originality of the English. The Englishman attaches his idea of liberty to the special [as opposed to the general] ; he does not trouble himself about the Understanding [logical inference], but on the contrary feels himself so much the more at liberty, the more his course of action or his license to act contravenes the Understanding – *i.e.,* runs counter to [logical inferences or] general principles. On the other hand, among the Romanic peoples we immediately encounter that internal schism, that holding fast by an abstract principle, and as the counterpart of this, an absence of the Totality of Spirit and sentiment which we call "Heart"; there is not that meditative introversion of the soul upon itself; – in their inmost being they may be said to be alienated from themselves [abstract principles *carry them away*]. With them the inner life is a region whose depth they do not appreciate; for it is given over "bodily" to particular [absorbing] interests, and the infinity that belongs to Spirit is not to be looked for there. Their inmost being is not their own. They leave it as an alien and indifferent matter, and are glad to have its concerns settled for them by another. That other to which they leave it is the Church. They have indeed something to do with it themselves; but since that which they have to do is not self-originated and self-prescribed, not their very own, they are content to leave the affair to be settled in a superficial way. "*Eh bien*," said Napoleon, "we shall go to mass again, and my good fellows will say: 'That is the word of command!'" This is the

leading feature in the character of these nations – the separation of the religious from the secular interest, *i.e.,* from the special interest of individuality; and the ground of this separation lies in their inmost soul, which has lost its independent entireness of being, its profoundest unity. Catholicism does not claim the essential direction of the Secular; religion remains an indifferent matter on the one side, while the other side of life is dissociated from it, and occupies a sphere exclusively its own. Cultivated Frenchmen therefore feel an antipathy to Protestantism because it seems to them something pedantic, dull, minutely captious in its morality; since it requires that Spirit and Thought should be directly engaged in religion: in attending mass and other ceremonies, on the contrary, no exertion of thought is required, but an imposing sensuous spectacle is presented to the eye, which does not make such a demand on one's attention as entirely to exclude a little chat, while yet the duties of the occasion are not neglected.

We spoke above of the *relation which the new doctrine sustained to secular life,* and now we have only to exhibit that relation in detail. The development and advance of Spirit from the time of the Reformation onwards consist in this, that Spirit, having now gained the consciousness of its Freedom, through that process of mediation which takes place between man and God – that is, in the full recognition of the objective process as the existence [the positive and definite manifestation] of the Divine essence – now takes it up and follows it out in building up the edifice of secular relations. That harmony [of Objective and Subjective Will] which has resulted from the painful struggles of History, involves the recognition of the Secular as capable of being an embodiment of Truth; whereas it had been formerly regarded as evil only, as incapable of Good – the latter being considered essentially ultramundane. It is now perceived that Morality and Justice in the State are also divine and commanded by God, and that in point of substance there is nothing higher or more sacred. One inference is

that *Marriage* is no longer deemed less holy than *Celibacy.* Luther took a wife to show that he respected marriage, defying the calumnies to which he exposed himself by such a step. It was his duty to do so, as it was also to eat meat on Fridays; to prove that such things are lawful and right, in opposition to the imagined superiority of abstinence. The Family introduces man to community – to the relation of interdependence in society; and this union is a moral one: while on the other hand the monks, separated from the sphere of social morality, formed as it were the standing army of the Pope, as the janizaries formed the basis of the Turkish power. The marriage of the priests entails the disappearance of the outward distinction between laity and clergy. – Moreover the repudiation of work no longer earned the reputation of sanctity; it was acknowledged to be more commendable for men to rise from a state of dependence by *activity,* intelligence, and industry, and make themselves independent. It is more consonant with justice that he who has money should spend it even in luxuries, than that he should give it away to idlers and beggars; for he bestows it on an equal number of persons by so doing, and these must at any rate have worked diligently for it. Industry, crafts and trades now have their moral validity recognized, and the obstacles to their prosperity which originated with the Church, have vanished. For the Church had pronounced it a sin to lend money on interest: but the necessity of so doing led to the direct violation of her injunctions. The Lombards (a fact which accounts for the use of the term "lombard" in French to denote a loan-office), and particularly the House of Medici, advanced money to princes in every part of Europe. The third point of sanctity in the Catholic Church – blind *obedience,* was likewise denuded of its false pretensions. Obedience to the laws of the State, as the Rational element in volition and action, was made the principle of human conduct. In this obedience man is free, for all that is demanded is that the Particular should yield to the General. Man himself has a

conscience; consequently the subjection required of him is a free allegiance. This involves the possibility of a development of Reason and Freedom, and of their introduction into human relations; and Reason and the Divine commands are now synonymous. The Rational no longer meets with contradiction on the part of the religious conscience; it is permitted to develop itself in its own sphere without disturbance, without being compelled to resort to force in defending itself against an adverse power. But in the Catholic Church, that adverse element is unconditionally sanctioned. Where the Reformed doctrine prevails, princes may still be bad governors, but they are no longer sanctioned and solicited thereto by the promptings of their religious conscience. In the Catholic Church on the contrary, it is nothing singular for the conscience to be found in opposition to the laws of the State. Assassinations of sovereigns, conspiracies against the state, and the like, have often been supported and carried into execution by the priests.

This harmony between the State and the Church has now attained *immediate* realization. We have, as yet, no reconstruction of the State, of the system of jurisprudence, etc., for thought must first discover the essential principle of Right. The Laws of Freedom had first to be expanded to a system as deduced from an absolute principle of Right. Spirit does not assume this complete form immediately after the Reformation; it limits itself at first to direct and simple changes, as *e.g.,* the doing away with conventual establishments and episcopal jurisdiction, etc. The reconciliation between God and the World was limited in the first instance to an abstract form; it was not yet expanded into a system by which the moral world could be regulated.

In the first instance this reconciliation must take place in the individual soul, must be realized by feeling; the individual must gain the assurance that the Spirit dwells in him – that, in the language of the Church, a

brokenness of heart has been experienced, and that Divine grace has entered into the heart thus broken. By Nature man is not what he ought to be; only through a transforming process does he arrive at truth. The general and speculative aspect of the matter is just this – that the human heart is not what it should be. It was then required of the individual that he should know what he is in himself; that is, the teaching of the Church insisted upon man's becoming conscious that he is evil. But the individual is evil only when the Natural manifests itself in mere sensual desire – when an unrighteous will presents itself in its untamed, untrained, violent shape; and yet it is required that such a person should know that he is depraved, and that the good Spirit dwells in him; in fact he is required to have a direct consciousness of and to "experience" that which was presented to him as a speculative and implicit truth. The Reconciliation having, then, assumed this abstract form, men tormented themselves with a view to force upon their souls the consciousness of their sinfulness and to know themselves as evil. The most simple souls, the most innocent natures were accustomed in painful introspection to observe the most secret workings of the heart, with a view to a rigid examination of them. With this duty was conjoined that of an entirely opposite description; it was required that man should attain the consciousness that the good Spirit dwells in him – that Divine Grace has found an entrance into his soul. In fact the important distinction between the knowledge of abstract truth and the knowledge of what has actual existence was left out of sight. Men became the victims of a tormenting uncertainty as to whether the good Spirit has an abode in them, and it was deemed indispensable that the entire process of spiritual transformation should become perceptible to the individual himself. An echo of this self-tormenting process may still be traced in much of the religious poetry of that time; the Psalms of David which exhibit a similar character were then introduced as hymns into the ritual of Protestant Churches. Protestantism

took this turn of minute and painful introspection, possessed with the conviction of the importance of the exercise, and was for a long time characterized by a self-tormenting disposition and an aspect of spiritual wretchedness; which in the present day has induced many persons to enter the Catholic pale, that they might exchange this inward uncertainty for a formal broad certainty based on the imposing totality of the Church. A more refined order of reflection upon the character of human actions was introduced into the Catholic Church also. The Jesuits analyzed the first rudiments of volition (*velleitas*) with as painful minuteness as was displayed in the pious exercises of Protestantism ; but they had a science of casuistry which enabled them to discover a good reason for everything, and so get rid of the burden of guilt which this rigid investigation seemed to aggravate.

With this was connected another remarkable phenomenon, common to the Catholic with the Protestant World. The human mind was driven into the Inward, the Abstract, and the Religious element was regarded as utterly alien to the secular. That lively consciousness of his subjective life and of the inward origin of his volition that had been awakened in man, brought with it the belief in *Evil,* as a vast power the sphere of whose malign dominion is the Secular. This belief presents a parallelism with the view in which the sale of Indulgences originated : for as eternal salvation could be secured for money, so by paying the price of one's salvation through a compact made with the Devil, the riches of the world and the unlimited gratification of desires and passions could be secured. Thus arose that famous legend of Faust, who in disgust at the unsatisfactory character of speculative science, is said to have plunged into the world and purchased all its glory at the expense of his salvation. Faust, if we may trust the poet, had the enjoyment of all that the world could give, in exchange for his soul's weal; but those poor women who were called *Witches* were reputed to get

nothing more by the bargain than the gratification of a petty revenge by making a neighbor's cow go dry or giving a child the measles. But in awarding punishment it was not the magnitude of the injury in the loss of the milk or the sickness of the child that was considered; it was the abstract power of the Evil One in them that was attacked. The belief in this abstract, special power whose dominion is the world – in the Devil and his devices – occasioned an incalculable number of *trials for witchcraft* both in Catholic and Protestant countries. It was impossible to prove the guilt of the accused; they were only suspected : it was therefore only a direct knowledge [one not mediated by proofs] on which this fury against the evil principle professed to be based. It was indeed necessary to have recourse to evidence, but the basis of these judicial processes was simply the belief that certain individuals were possessed by the power of the Evil One. This delusion raged among the nations in the sixteenth century with the fury of a pestilence. The main impulse was suspicion. The principle of suspicion assumes a similarly terrible shape during the sway of the Roman Emperors, and under Robespierre's Reign of Terror; when mere disposition, unaccompanied by any overt act or expression, was made an object of punishment. Among the Catholics, it was the Dominicans to whom (as was the Inquisition in all its branches) the trials for witchcraft were intrusted. Father Spee, a noble Jesuit, wrote a treatise against them (he is also the author of a collection of fine poems bearing the title of "*Trutznachtigall*,") giving a full exposure of the terrible character of criminal justice in proceedings of this kind. Torture, which was only to be applied once, was continued until a confession was extorted. If the accused fainted under the torture it was averred that the Devil was giving them sleep: if convulsions supervened, it was said that the Devil was laughing in them; if they held out steadfastly, the Devil was supposed to give them power. These persecutions spread like an epidemic sickness through Italy, France, Spain and Germany.

The earnest remonstrances of enlightened men, such as Spec and others, already produced a considerable effect. But it was Thomasius, a Professor of Halle, who first opposed this prevalent superstition with very decided success. The entire phenomenon is in itself most remarkable when we reflect that we have not long been quit of this frightful barbarity (even as late as the year 1780 a witch was publicly burned at Glarus in Switzerland). Among the Catholics persecution was directed against heretics as well as against witches: we might say indeed that they were placed in one category; the unbelief of the heretics was regarded as none other than the indwelling principle of Evil – a possession similar to the other.

Leaving this abstract form of Subjectiveness we have now to consider the *secular* side – the constitution of the State and the advance of Universality – the recognition of the universal laws of Freedom. This is the second and the essential point.

CHAPTER II. INFLUENCE OF THE REFORMATION ON POLITICAL DEVELOPMENT.

IN TRACING THE course of the political development of the period, we observe in the first place the consolidation of Monarchy, and the Monarch invested with an authority emanating from the State. The incipient stage in the rise of royal power, and the commencement of that unity which the states of Europe attained, belong to a still earlier period. While these changes were going forward, the entire body of private obligations and rights which had been handed down from the Middle Age, still retained validity. Infinitely important is this form of private rights, which the organic constituents of the executive power of the State have assumed. At their apex we find a fixed and positive principle – the exclusive right of one family to the possession of the throne, and the hereditary succession of sovereigns further restricted by the law of primogeniture. This gives the State an immovable centre. The fact that Germany was an elective empire prevented its being consolidated into one state; and for the same reason Poland has vanished from the circle of independent states. The State must have a final decisive will: but if an individual is to be the final deciding power, he must be so in a direct and natural way, not as determined by choice and theoretic views, etc. Even among the free Greeks the oracle was the external power which decided their policy on critical occasions; here *birth* is the oracle – something independent of any arbitrary volition. But the circumstance that the highest station in a monarchy is assigned to a family, seems to indicate that the sovereignty is the private property of that family. As such that sovereignty would seem to be divisible; but since the idea of division of power is opposed to the principle of the state, the rights of the monarch and

his family required to be more strictly defined. Sovereign possession is not a peculium of the individual ruler, but is consigned to the dynastic family as a trust; and the *estates of the realm* possess security that that trust shall be faithfully discharged, for they have to guard the unity of the body politic. Thus, then, royal possession no longer denotes a kind of private property, private possession of estates, demesnes, jurisdiction, etc., but has become a State-property – a function pertaining to and involved with the State.

Equally important, and connected with that just noticed, is the change of executive powers, functions, duties and rights, which naturally belong to the State, but which had become private property and private contracts or obligations – into possession conferred by the State. The rights of seigneurs and barons were annulled, and they were obliged to content themselves with official positions in the State. This transformation of the rights of vassals into official functions took place in the several kingdoms in various ways. In *France,* e.g., the great Barons, who were governors of provinces, who could claim such offices as a matter of right, and who like the Turkish Pashas, maintained a body of troops with the revenues thence derived – troops which they might at any moment bring into the field against the King – were reduced to the position of mere landed proprietors or court nobility, and those Pashalics became offices held under the government; or the nobility were employed as officers – generals of the army, an army belonging to the *State.* In this aspect the origination of *standing armies* is so important an event; for they supply the monarchy with an independent force and are as necessary for the security of the central authority against the rebellion of the subject individuals as for the defence of the state against foreign enemies. The fiscal system indeed had not as yet assumed a systematic character – the revenue being derived from customs, taxes and tolls in countless variety, besides the subsidies and contributions paid by the estates of the realm; in return for which the right of presenting a statement

of grievances was conceded to them, as is now the case in Hungary. – In *Spain* the spirit of chivalry had assumed a very beautiful and noble form. This chivalric spirit, this knightly dignity, degraded to a mere inactive sentiment of honor, has attained notoriety as the Spanish *grandezza.* The Grandees were no longer allowed to maintain troops of their own, and were also withdrawn from the command of the armies; destitute of power they had to content themselves as private persons with an empty title. But the means by which the royal power in Spain was consolidated, was the *Inquisition.* This, which was established for the persecution of those who secretly adhered to Judaism, and of Moors and heretics, soon assumed a political character, being directed against the enemies of the State. Thus the Inquisition confirmed the despotic power of the King: it claimed supremacy even over bishops and archbishops, and could cite them before its tribunal. The frequent confiscation of property – one of the most customary penalties – tended to enrich the treasury of the State. Moreover, the Inquisition was a tribunal which took cognizance of mere suspicion; and while it consequently exercised a fearful authority over the clergy, it had a peculiar support in the national pride. For every Spaniard wished to be considered Christian by descent, and this species of vanity fell in with the views and tendency of the Inquisition. Particular provinces of the Spanish monarchy, as *e.g.,* Aragon, still retained many peculiar rights and privileges; but the Spanish Kings from Philip II downwards proceeded to suppress them altogether. It would lead us too far to pursue in detail the process of the depression of the aristocracy in the several states of Europe. The main scope of this depressing process was, as already stated, the curtailment of the private rights of the feudal nobility, and the transformation of their seigneurial authority into an official position in connection with the State. This change was in the interest of both the King and the People. The powerful barons seemed to constitute an intermediate body charged with the

defence of liberty; but properly speaking, it was only their own privileges which they maintained against the royal power on the one hand and the citizens on the other hand. The barons of England extorted Magna Charta from the King; but the citizens gained nothing by it, on the contrary they remained in their former condition. Polish Liberty too, meant nothing more than the freedom of the barons in contraposition to the King, the nation being reduced to a state of absolute serfdom. When liberty is mentioned, we must always be careful to observe whether it is not really the assertion of private interests which is thereby designated. For although the nobility were deprived of their sovereign power, the people were still oppressed in consequence of their absolute dependence, their serfdom, and subjection to aristocratic jurisdiction; and they were partly declared utterly incapable of possessing property, partly subjected to a condition of bond-service which did not permit of their freely selling the products of their industry. The supreme interest of emancipation from this condition concerned the power of the State as well as the subjects – that emancipation which now gave them as citizens the character of free individuals, and determined that what was to be performed for the Commonwealth should be a matter of just allotment, not of mere chance. The aristocracy of possession maintains that possession against both – viz., against the power of the State at large and against individuals. But the aristocracy have a position assigned them, as the support of the throne, as occupied and active on behalf of the State and the common weal, and at the same time as maintaining the freedom of the citizens. This in fact is the prerogative of that class which forms the link between the Sovereign and the People – to undertake to discern and to give the first impulse to that which is intrinsically Rational and Universal ; and this recognition of and occupation with the Universal must take the place of positive personal right. This subjection to the Head of the State of that intermediate power which laid claim to positive authority was now

accomplished, but this did not involve the emancipation of the subject class. This took place only at a later date, when the idea of right in and for itself arose in men's minds. Then the sovereigns relying on their respective peoples, vanquished the caste of unrighteousness; but where they united with the barons, or where the latter maintained their freedom against the kings, those positive rights or rather wrongs continued.

We observe also as an essential feature now first presenting itself in the political aspect of the time, a connected *system of States* and a relation of States to each other. They became involved in various wars: the Kings having enlarged their political authority, now turn their attention to foreign lands, insisting upon claims of all kinds. The aim and real interest of the wars of the period is invariably conquest.

Italy especially had become such an object of desire, and was a prey to the rapacity of the French, the Spaniards, and at a later date, of the Austrians. In fact absolute disintegration and dismemberment has always been an essential feature in the national character of the inhabitants of Italy, in ancient as well as in modern times. Their stubborn individuality was exchanged for a union the result of force, under the Roman dominion ; but as soon as this bond was broken, the original character reappeared in full strength. In later times, as if finding in them a bond of union otherwise impossible – after having escaped from a selfishness of the most monstrous order and which displayed its perverse nature in crimes of every description – the Italians attained a taste for the *Fine Arts:* thus their civilization, the mitigation of their selfishness, reached only the Grade of Beauty, not that of Rationality – the higher unity of Thought. Consequently, even in poetry and song the Italian nature is different from ours. Improvisation characterizes the genius of the Italians; they pour out their very souls in Art and the ecstatic enjoyment of it. Enjoying a *naturel* so imbued with Art, the State must be an affair of comparative indifference, a merely casual matter to the

Italians. But we have to observe also that the wars in which *Germany* engaged, were not particularly honorable to it: it allowed Burgundy, Lorraine, Alsace, and other parts of the empire to be wrested from it. From these wars between the various political powers there arose common interests, and the object of that community of interest was the maintenance of severalty – the preservation to the several States of their independence – in fact the "*balance of power*." The motive to this was of a decidedly "practical" kind, viz., the protection of the several States from conquest. The union of the States of Europe as the means of shielding individual States from the violence of the powerful – the preservation of the balance of power, had now taken the place of that general aim of the elder time, the defence of Christendom, whose centre was the Papacy. This new political motive was necessarily accompanied by a diplomatic condition – one in which all the members of the great European system, however distant, felt an interest in that which happened to any one of them. Diplomatic policy had been brought to the greatest refinement in Italy, and was thence transmitted to Europe at large. Several princes in succession seemed to threaten the stability of the balance of power in Europe. When this combination of States was just commencing, *Charles V* was aiming at universal monarchy; for he was Emperor of Germany and King of Spain to boot: the Netherlands and Italy acknowledged his sway, and the whole wealth of America flowed into his coffers. With this enormous power, which, like the contingencies of fortune in the case of private property, had been accumulated by the most felicitous combinations of political dexterity – among other things by marriage, – but which was destitute of an internal and reliable bond, he was nevertheless unable to gain any advantage over France, or even over the German princes; nay he was even compelled to a peace by Maurice of Saxony. His whole life was spent in suppressing disturbances in all parts of his empire and in conducting foreign wars. The

balance of power in Europe was similarly threatened by *Louis XIV.* Through that depression of the grandees of his kingdom which Richelieu and after him Mazarin had accomplished, he had become an absolute sovereign. France, too, had the consciousness of its intellectual superiority in a refinement of culture surpassing anything of which the rest of Europe could boast. The pretensions of Louis were founded not on extent of dominion, (as was the case with Charles V) so much as on that culture which distinguished his people, and which at that time made its way everywhere with the language that embodied it, and was the object of universal admiration: they could therefore plead a higher justification than those of the German Emperor. But the very rock on which the vast military resources of Philip II had already foundered – the heroic resistance of the Dutch – proved fatal also to the ambitious schemes of Louis. *Charles XII* also presented a remarkably menacing aspect; but his ambition had a Quixotic tinge and was less sustained by intrinsic vigor. Through all these storms the nations of Europe succeeded in maintaining their individuality and independence. An external relation in which the States of Europe had an interest in common, was that sustained to *the Turks* – the terrible power which threatened to overwhelm Europe from the East. The Turks of that day had still a sound and vigorous nationality, whose power was based on conquest, and which was therefore engaged in constant warfare, or at least admitted only a temporary suspension of arms. As was the case among the Franks, the conquered territories were divided among their warriors as personal, not heritable possessions; when in later times the principle of hereditary succession was adopted, the national vigor was shattered. The flower of the Osman force, the Janizaries, were the terror of the Europeans. Their ranks were recruited from a body of Christian boys of handsome and vigorous proportions, brought together chiefly by means of annual conscriptions among the Greek subjects of the Porte, strictly educated in the

Moslem faith, and exercised in arms from early youth. Without parents, without brothers or sisters, without wives, they were, like the monks, an altogether isolated and terrible corps. The Eastern European powers were obliged to make common cause against the Turks – viz.: Austria, Hungary, Venice and Poland. The battle of Lepanto saved Italy, and perhaps all Europe, from a barbarian inundation.

An event of special importance following in the train of the Reformation was the *struggle of the Protestant Church* for political existence. The Protestant Church, even in its original aspect, was too intimately connected with secular interests not to occasion secular complications and political contentions respecting political possession. The subjects of Catholic princes become Protestant, have and make claims to ecclesiastical property, change the nature of the tenure, and repudiate or decline the discharge of those ecclesiastical functions to whose due performance the emoluments are attached (*jura stoloe*). Moreover a Catholic government is bound to be the *brachium seculare* of the Church; the Inquisition, *e.g.,* never put a man to death, but simply declared him a heretic, as a kind of jury; he was then punished according to civil laws. Again, innumerable occasions of offence and irritation originated with processions and feasts, the carrying of the Host through the streets, withdrawals from convents, etc. Still more excitement would be felt when an Archbishop of Cologne attempted to make his archepiscopate a secular princedom for himself and his family. Their confessors made it a matter of conscience with Catholic princes to wrest estates that had been the property of the Church out of the hands of the heretics. In Germany, however, the condition of things was favorable to Protestantism in as far as the several territories which had been imperial fiefs, had become independent principalities. But in countries like Austria, the princes were indifferent to Protestants, or even hostile to them; and in France they were not safe in the exercise of their religion except as

protected by fortresses. War was the indispensable preliminary to the security of Protestants ; for the question was not one of simple conscience, but involved decisions respecting public and private property which had been taken possession of in contravention of the rights of the Church, and whose restitution it demanded. A condition of absolute mistrust supervened; absolute, because mistrust bound up with the religious conscience was its root. The Protestant princes and towns formed at that time a feeble union, and the defensive operations they conducted were much feebler still. After they had been worsted, Maurice the Elector of Saxony, by an utterly unexpected and adventurous piece of daring, extorted a peace, itself of doubtful interpretation, and which left the real sources of embitterment altogether untouched. It was necessary to fight out the battle from the very beginning. This took place in the *Thirty Years' War,* in which first Denmark and then Sweden undertook the cause of freedom. The former was compelled to quit the field, but the latter under Gustavus Adolphus – that hero of the North of glorious memory – played a part which was so much the more brilliant inasmuch as it began to wage war with the vast force of the Catholics, alone – without the help of the Protestant states of the Empire. The powers of Europe, with a few exceptions, precipitate themselves on Germany – flowing back towards it as to the fountain from which they had originally issued, and where now the right of inwardness that has come to manifest itself in the sphere of religion, and that of internal independence and severalty is to be fought out. The struggle ends without an Ideal result – without having attained the consciousness of a principle as an intellectual concept – in the exhaustion of all parties, in a scene of utter desolation, where all the contending forces have been wrecked; it issues in letting parties simply take their course and maintain their existence on the basis of external power. The issue is in fact exclusively of a *political* nature.

In *England* also, war was indispensable to the establishment of the Protestant *Church*: the struggle was in this case directed against the sovereigns, who were secretly attached to Catholicism because they found the principle of absolute sway confirmed by its doctrines. The fanaticized people rebelled against the assumption of absolute sovereign power – importing that Kings are responsible to God alone (*i.e.,* to the Father Confessor) – and in opposition to Catholic externality, unfurled the banner of extreme subjectivity in Puritanism – a principle which, developing itself in the real world, presents an aspect partly of enthusiastic elevation, partly of ridiculous incongruity. The enthusiasts of England, like those of Münster, were for having the State governed directly by the fear of God; the soldiery sharing the same fanatical views prayed while they fought for the cause they had espoused. But a military leader now has the physical force of the country and consequently the government in his hands: for in the State there must be government, and Cromwell knew what governing is. He, therefore, made himself ruler, and sent that praying parliament about their business. With his death however his right to authority vanished also, and the old dynasty regained possession of the throne. Catholicism, we may observe, is commended to the support of princes as promoting the security of their government – a position supposed to be particularly manifest if the Inquisition be connected with the government; the former constituting the bulwark of the latter. But such a security is based on a slavish religious obedience, and is limited to those grades of human development in which the political constitution and the whole legal system still rest on the basis of actual positive possession; but if the constitution and laws are to be founded on a veritable eternal Right, then security is to be found only in the Protestant religion, in whose principle Rational Subjective Freedom also attains development. The *Dutch* too offered a vigorous opposition to the Catholic principle as bound up with the Spanish sovereignty. Belgium was

still attached to the Catholic religion and remained subject to Spain: on the contrary, the northern part of the Netherlands – Holland – stood its ground with heroic valor against its oppressors. The trading class, the guilds and companies of marksmen formed a militia whose heroic courage was more than a match for the then famous Spanish infantry. Just as the Swiss peasants had resisted the chivalry of Austria, so here the trading cities held out against disciplined troops. During this struggle on the Continent itself, the Dutch fitted out fleets and deprived the Spaniards of part of their colonial possessions, from which all their wealth was derived. As independence was secured to Holland in its holding to the Protestant principle, so that of *Poland* was lost through its endeavor to suppress that principle in the case of dissidents. Through the *Peace of Westphalia* the Protestant Church had been acknowledged as an independent one – to the great confusion and humiliation of Catholicism. This peace has often passed for the palladium of Germany, as having established its political constitution. But this constitution was in fact a confirmation of the particular rights of the countries into which Germany had been broken up. It involves no thought, no conception of the proper aim of a state. We should consult "Hippolytus à lapide" (a book which, written before the conclusion of the peace, had a great influence on the condition of the Empire) if we would become acquainted with the character of that German freedom of which so much is made. In the peace in question the establishment of a complete particularity, the determination of all relations on the principle of private right is the object manifestly contemplated – a *constituted anarchy,* such as the world had never before seen; – *i.e.,* the position that an Empire is properly a unity, a totality, a state, while yet all relations are determined so exclusively on the principle of private right that the privilege of all the constituent parts of that Empire to act for themselves contrarily to the interest of the whole, or to neglect that which its interest demands and

which is even required by law – is guaranteed and secured by the most inviolable sanctions. Immediately after this settlement, it was shown what the *German Empire* was as a state in relation to other states: it waged ignominious wars with the Turks, for deliverance from whom Vienna was indebted to Poland. Still more ignominious was its relation to France, which took possession in time of peace of free cities, the bulwarks of Germany, and of flourishing provinces, and retained them undisturbed.

This constitution, which completely terminated the career of Germany as an Empire, was chiefly the work of *Richelieu,* by whose assistance – Romish Cardinal though he was – religious freedom in Germany was preserved. Richelieu, with a view to further the interests of the State whose affairs he superintended, adopted the exact opposite of that policy which he promoted in the case of its enemies; for he reduced the latter to political impotence by ratifying the political independence of the several parts of the Empire, while at home he destroyed the independence of the Protestant party. His fate has consequently resembled that of many great statesmen, inasmuch as he has been cursed by his countrymen, while his enemies have looked upon the work by which he ruined them as the most sacred goal of their desires – the consummation of their rights and liberties. The result of the struggle therefore was the forcibly achieved and now politically ratified coexistence of religious parties, forming political communities whose relations are determined according to prescriptive principles of civil or [rather, for such their true nature was] of private right.

The Protestant Church increased and so perfected the stability of its political existence by the fact that one of the states which had adopted the principles of the Reformation raised itself to the position of an independent European power. This power was destined to start into a new life with Protestantism: *Prussia,* viz., which making its appearance at the end of the seventeenth century, was indebted, if not for origination, yet certainly for

the consolidation of its strength, to Frederick the Great; and the Seven Years' War was the struggle by which that consolidation was accomplished. Frederick II demonstrated the independent vigor of his power by resisting that of almost all Europe – the union of its leading states. He appeared as the hero of Protestantism, and that not individually merely, like Gustavus Adolphus, but as the ruler of a state. The Seven Years' War was indeed in itself not a war of religion; but it was so in view of its ultimate issues, and in the disposition of the soldiers as well as of the potentates under whose banner they fought. The Pope consecrated the sword of Field-Marshal Daun, and the chief object which the Allied Powers proposed to themselves was the crushing of Prussia as the bulwark of the Protestant Church. But Frederick the Great not only made Prussia one of the great powers of Europe as a Protestant power, but was also a philosophical King – an altogether peculiar and unique phenomenon in modern times.

There had been English Kings who were subtle theologians, contending for the principle of absolutism: Frederick on the contrary took up the Protestant principle in its secular aspect; and though he was by no means favorable to religious controversies, and did not side with one party or the other, he had the consciousness of Universality, which is the profoundest depth to which Spirit can attain, and is Thought conscious of its own inherent power.

CHAPTER III. THE ÉCLAIRCISSEMENT AND REVOLUTION

PROTESTANTISM HAD INTRODUCED the *principle* of Subjectivity, importing religious emancipation and inward harmony, but accompanying this with the *belief* in Subjectivity as Evil, and in a power [adverse to man's highest interests] whose embodiment is "the World." Within the Catholic pale also, the casuistry of the Jesuits brought into vogue interminable investigations, as tedious and wire-drawn as those in which the scholastic theology delighted, respecting the subjective spring of the Will and the motives that affect it. This Dialectic, which unsettles all particular judgments and opinions, transmuting the Evil into Good and Good into Evil, left at last nothing remaining but the mere action of subjectivity itself, the Abstractum of Spirit – *Thought.* Thought contemplates everything under the form of Universality, and is consequently the impulsion towards and production of the Universal. In that elder scholastic theology the real subject-matter of investigation – the doctrine of the Church – remained an ultramundane affair; in the Protestant theology also Spirit still sustained a relation to the Ultramundane; for on the one side we have the will of the individual – the Spirit of Man – I, myself, and on the other the Grace of God, the Holy Ghost; and so in the Wicked, the Devil. But in Thought, Self moves within the limits of its own sphere; that with which it is occupied – its objects are as absolutely present to it [as they were distinct and separate in the intellectual grade above mentioned] ; for in thinking I must elevate the object to Universality. This is utter and absolute Freedom, for the pure Ego, like pure Light, is with itself alone [is not involved with any alien principle] ; thus that which is diverse from itself, sensuous or spiritual, no

longer presents an object of dread, for in contemplating such diversity it is inwardly free and can freely confront it. A practical interest makes use of, consumes the objects offered to it: a theoretical interest calmly contemplates them, assured that in themselves they present no alien element. – Consequently, the *ne plus ultra* of Inwardness, of Subjectiveness, is Thought. Man is not free, when he is not thinking; for except when thus engaged he sustains a relation to the world around him as to another, an alien form of being. This comprehension – the penetration of the Ego into and beyond other forms of being with the most profound self-certainty [the identity of subjective and objective Reason being recognized], directly involves the harmonization of Being: for it must be observed that the unity of Thought with its Object is already *implicitly* present [*i.e.,* in the fundamental constitution of the Universe], for Reason is the substantial basis of Consciousness as well as of the External and Natural. Thus that which presents itself as the Object of Thought is no longer an absolutely distinct form of existence [ein Jenseits], not of an alien and grossly substantial [as opposed to intelligible] nature.

Thought is the grade to which Spirit has now advanced. It involves the Harmony of Being in its purest essence, challenging the external world to exhibit the same Reason which Subject [the Ego] possesses. Spirit perceives that Nature – the World – must also be an embodiment of Reason, for God created it on principles of Reason. An interest in the contemplation and comprehension of the present world became universal. Nature embodies Universality, inasmuch as it is nothing other than Sorts, Genera, Power, Gravitation, etc., phenomenally presented. Thus *Experimental Science* became the science of the World; for experimental science involves on the one hand the observation of phenomena, on the other hand also the discovery of the Law, the essential being, the hidden force that causes those phenomena – thus reducing the data supplied by observation to their simple

principles. Intellectual consciousness was first extricated from that sophistry of thought, which unsettles everything, by *Descartes.* As it was the purely German nations among whom the principle of *Spirit* first manifested itself, so it was by the Romanic nations that the *abstract idea* (to which the character assigned them above – viz., that of internal schism, more readily conducted them) was first comprehended. Experimental science therefore very soon made its way among them (in common with the Protestant English), but especially among the Italians. It seemed to men as if God had but just created the moon and stars, plants and animals, as if the laws of the universe were now established for the first time; for only then did they feel a real interest in the universe, when they recognized their own Reason in the Reason which pervades it. The human eye became *clear,* perception quick, thought active and interpretative. The discovery of the laws of Nature enabled men to contend against the monstrous superstition of the time, as also against all notions of mighty alien powers which magic alone could conquer. The assertion was even ventured on, and that by Catholics not less than by Protestants, that the External [and Material], with which the Church insisted upon associating superhuman virtue, was external and material, and nothing more – that the Host was simply *dough,* the relics of the Saints mere *bones.* The independent authority of Subjectivity was maintained against belief founded on authority, and the Laws of Nature were recognized as the only bond connecting phenomena with phenomena. Thus all miracles were disallowed: for Nature is a system of known and recognized Laws; Man is at home in it, and that only passes for truth in which he finds himself at home; he is free through the acquaintance he has gained with Nature. Nor was thought less vigorously directed to the Spiritual side of things: Right and [Social] Morality came to be looked upon as having their foundation in the actual present Will of man, whereas formerly it was referred only to the command of God enjoined *ab*

extra, written in the Old and New Testament, or appearing in the form of particular Right [as opposed to that based on general principles] in old parchments, as *privilegia,* or in international compacts. What the nations acknowledge as international Right was deduced empirically from observation (as in the work of Grotius) ; then the source of the existing civil and political law was looked for, after Cicero's fashion, in those instincts of men which Nature has planted in their hearts – *e.g.,* the social instinct; next the principle of security for the person and property of the citizens, and of the advantage of the commonwealth – that which belongs to the class of "reasons of State." On these principles private rights were on the one hand despotically contravened, but on the other hand such contravention was the instrument of carrying out the general objects of the State in opposition to mere positive or prescriptive claims. Frederick II may be mentioned as the ruler who inaugurated the new epoch in the sphere of practical life – that epoch in which practical *political interest* attains Universality [is recognized as an abstract principle], and receives an absolute sanction. Frederick II merits especial notice as having comprehended the general object of the State, and as having been the first sovereign who kept the general interest of the State steadily in view, ceasing to pay any respect to particular interests when they stood in the way of the common weal. His immortal work is a domestic code – the Prussian municipal law. How the head of a household energetically provides and governs with a view to the weal of that household and of his dependents – of this he has. given a unique specimen.

These general conceptions, deduced from actual and present consciousness – the Laws of Nature and the substance of what is right and good, have received the name of *Reason.* The recognition of the validity of these laws was designated by the term *Éclaircissement* (*Aufklärung*). From France it passed over into Germany, and created a new world of ideas. The absolute criterion – taking the place of all authority based on religious belief

and positive laws of Right (especially political Right) – is the verdict passed by Spirit itself on the character of that which is to be believed or obeyed. After a free investigation in open day, Luther had secured to mankind Spiritual Freedom and the Reconciliation [of the Objective and Subjective] in the concrete: he triumphantly established the position that man's eternal destiny [his spiritual and moral position] must be wrought out *in himself* [cannot be an *opus operatum,* a work performed *for him*]. But the *import* of that which is to take place in him – what truth is to become vital in him, was taken for granted by Luther as something already given, something revealed by religion. *Now,* the principle was set up that this import must be capable of actual investigation – something of which I [in this modern time] can gain an inward conviction – and that to this basis of inward demonstration every dogma must be referred.

This principle of thought makes its appearance in the first instance in a general and abstract form; and is based on the axiom of Contradiction and Identity. The results of thought are thus posited as finite, and the eclaircissement utterly banished and extirpated all that was speculative from things human and divine. Although it is of incalculable importance that the multiform complex of things should be reduced to its simplest conditions, and brought into the form of Universality, yet this still abstract principle does not satisfy the living Spirit, the concrete human soul.

This formally absolute principle brings us to *the last stage in History, our world, our own time.*

Secular life is the positive and definite embodiment of the Spiritual Kingdom – the Kingdom of the *Will* manifesting itself in outward existence. Mere impulses are also forms in which the inner life realizes itself; but these are transient and disconnected; they are the ever-changing applications of volition. But that which is just and moral belongs to the essential, independent, intrinsically universal Will; and if we would know

what Right really is, we must abstract from inclination, impulse and desire as the particular; *i.e.,* we must know what the Will is in itself. For benevolent, charitable, social impulses are nothing more than impulses – to which others of a different class are opposed. What the Will is in itself can be known only when these specific and contradictory forms of volition have been eliminated. Then Will appears as Will, in its abstract essence. The Will is Free only when it does not will anything alien, extrinsic, foreign to itself (for as long as it does so, it is dependent), but wills itself alone – wills the Will. This is absolute Will – the volition to be free. Will making itself its own object is the basis of all Right and Obligation – consequently of all statutory determinations of Right, categorical imperatives, and enjoined obligations. The Freedom of the Will *per se,* is the principle and substantial basis of all Right – is itself absolute, inherently eternal Right, and the Supreme Right in comparison with other specific Rights; nay, it is even that by which Man becomes Man, and is therefore the fundamental principle of Spirit. But the next question is: How does Will assume a definite form? For in willing itself, it is nothing but an identical reference to itself; but, in point of fact, it wills something specific: there *are,* we know, distinct and special Duties and Rights. A particular application, a definite form of Will, is desiderated; for pure Will is its own object, its own application, which, as far as this showing goes, is no object, no application. In fact, in this form it is nothing more than *formal* Will. But the metaphysical process by which this abstract Will develops itself, so as to attain a definite form of Freedom, and how Rights and Duties are evolved therefrom, this is not the place to discuss. It may however be remarked that the same principle obtained speculative recognition in Germany, in the *Kantian* Philosophy. According to it the simple unity of Self-consciousness, the Ego, constitutes the absolutely independent Freedom, and is the fountain of all general conceptions – *i.e.,* all conceptions elaborated by Thought – Theoretical

Reason; and likewise of the highest of all practical determinations [or conceptions] – Practical Reason, as free and pure Will; and Rationality of Will is none other than the maintaining one's self in pure Freedom – willing this and this alone – Right purely for the sake of Right, Duty purely for the sake of Duty. Among the Germans this view assumed no other form than that of tranquil theory; but the French wished to give it practical effect. Two questions, therefore, suggest themselves: Why did this principle of Freedom remain merely formal? and why did the French alone, and not the Germans, set about realizing it? With the formal principle more significant categories were indeed connected: one of the chief of these (for instance) was Society, and that which is advantageous for Society: but the aim of Society is itself political – that of the State (vid. "Droits de l'homme et du citoyen," 1791) – the conservation of *Natural* Rights; but Natural Right is Freedom, and, as further determined, it is *Equality* of Rights before the Law. A direct connection is manifest here, for Equality, *Parity,* is the result of the comparison of many; the "Many" in question being human beings, whose essential characteristic is the same, viz., Freedom. That principle remains formal, because it originated with abstract Thought – with the Understanding, which is primarily the selfconsciousness of Pure Reason, and as direct [unreflected, undeveloped] is abstract. As yet, nothing further is developed from it, for it still maintains an adverse position to Religion, *i.e.* to the concrete absolute substance of the Universe. As respects the second question – why the French immediately passed over from the theoretical to the practical, while the Germans contented themselves with theoretical abstraction, it might be said: the French are hot-headed [*ils ont la tête près du bonnet*]; but this is a superficial solution: the fact is that the formal principle of philosophy in Germany encounters a concrete real World in which Spirit finds inward satisfaction and in which conscience is at rest. For on the one hand it was the *Protestant World* itself which

advanced so far in Thought as to realize the absolute culmination of Self-Consciousness; on the other hand, Protestantism enjoys, with respect to the moral and legal relations of the real world, a tranquil confidence in the [Honorable] Disposition of men – a sentiment, which, [in the Protestant World,] constituting one and the same thing with Religion, is the fountain of all the equitable arrangements that prevail with regard to private right and the constitution of the State. In Germany the éclaircissement was conducted in the interest of theology: in France it immediately took up a position of hostility to the Church. In Germany the entire compass of secular relations had already undergone a change for the better; those pernicious ecclesiastical institutes of celibacy, voluntary pauperism, and laziness, had been already done away with; there was no dead weight of enormous wealth attached to the Church, and no constraint put upon Morality – a constraint which is the source and occasion of vices; there was not that unspeakably hurtful form of iniquity which arises from the interference of spiritual power with secular law, nor that other of the Divine Right of Kings, *i.e.* the doctrine that the arbitrary will of princes, in virtue of their being "the Lord's Anointed," is divine and holy: on the contrary their will is regarded as deserving of respect only so far as in association with reason, it wisely contemplates Right, Justice, and the weal of the community. The principle of Thought, therefore, had been so far conciliated already; moreover the Protestant World had a conviction that in the Harmonization which had previously been evolved [in the sphere of Religion] the principle which would result in a further development of equity in the political sphere was already present.

Consciousness that has received an abstract culture, and whose sphere is the Understanding [*Verstand*] can be indifferent to Religion, but Religion is the general form in which Truth exists for *non-abstract* consciousness. And the Protestant Religion does not admit of two kinds of consciences, while in

the Catholic world the Holy stands on the one side and on the other side abstraction opposed to Religion, that is to its superstition and its truth. That formal, individual Will is in virtue of the abstract position just mentioned made the basis of political theories; Right in Society is that which the Law wills, and the Will in question appears as an isolated *individual* will; thus the State, as an aggregate of many individuals, is not an independently substantial Unity, and the truth and essence of Right in and for itself – to which the will of its individual members ought to be conformed in order to be true, free Will; but the volitional atoms [the individual wills of the members of the State] are made the starting point, and each will is represented as absolute. An *intellectual principle* was thus discovered to serve as a basis for the State – one which does not, like previous principles, belong to the sphere of opinion, such as the social impulse, the desire of security for property, etc., nor owe its origin to the religious sentiment, as does that of the Divine appointment of the governing power – but the principle of Certainty, which is identity with my self-consciousness, stopping short however of that of Truth, which needs to be distinguished from it. This is a vast discovery in regard to the profoundest depths of being and Freedom. The consciousness of the Spiritual is now the essential basis of the political fabric, and *Philosophy* has thereby become dominant. It has been said, that the *French Revolution* resulted from Philosophy, and it is not without reason that Philosophy has been called "Weltweisheit" [World Wisdom;] for it is not only Truth in and for itself, as the pure essence of things, but also Truth in its living form as exhibited in the affairs of the world. We should not, therefore, contradict the assertion that the Revolution received its first impulse from Philosophy. But this philosophy is in the first instance only abstract Thought, not the concrete comprehension of absolute Truth – intellectual positions between which there is an immeasurable chasm.

The principle of the Freedom of the Will, therefore, asserted itself against existing Right. Before the French Revolution, it must be allowed, the power of the grandees had been diminished by Richelieu, and they had been deprived of privileges; but, like the clergy, they retained all the prerogatives which gave them an advantage over the lower class. The political condition of France at that time presents nothing but a confused mass of privileges altogether contravening Thought and Reason – an utterly irrational state of things, and one with which the greatest corruption of morals, of Spirit was associated – an empire characterized by Destitution of Right, and which, when its real state begins to be recognized, becomes shameless destitution of Right. The fearfully heavy burdens that pressed upon the people, the embarrassment of the government to procure for the Court the means of supporting luxury and extravagance, gave the first impulse to discontent. The new Spirit began to agitate men's minds: oppression drove men to investigation. It was perceived that the sums extorted from the people were not expended in furthering the objects of the State, but were lavished in the most unreasonable fashion. The entire political system appeared one mass of injustice. The change was necessarily violent, because the work of transformation was not undertaken by the government. And the reason why the government did not undertake it was that the Court, the Clergy, the Nobility, the Parliaments themselves, were unwilling to surrender the privileges they possessed, either for the sake of expediency or that of abstract Right; moreover, because the government as the concrete centre of the power of the State, could not adopt as its principle abstract individual wills, and reconstruct the State on this basis; lastly, because it was Catholic, and therefore the Idea of Freedom – Reason embodied in Laws – did not pass for the final absolute obligation, since the Holy and the religious conscience are separated from them. The conception, the idea of Right asserted its authority *all at once,* and the old framework of

injustice could offer no resistance to its onslaught. A constitution, therefore, was established in harmony with the conception of Right, and on this foundation all future legislation was to be based. Never since the sun had stood in the firmament and the planets revolved around him had it been perceived that man's existence centres in his head, *i.e.,* in Thought, inspired by which he builds up the world of reality. Anaxagoras had been the first to say that nous; governs the World; but not until now had man advanced to the recognition of the principle that Thought ought to govern spiritual reality, This was accordingly a glorious mental dawn. All thinking beings shared in the jubilation of this epoch. Emotions of a lofty character stirred men's minds at that time; a spiritual enthusiasm thrilled through the world, as if the reconciliation between the Divine and the Secular was now first accomplished.

The two following points must now occupy our attention: 1st. The course which the Revolution in France took; 2d. How that Revolution became World-Historical.

1. Freedom presents two aspects: the one concerns its substance and purport – its objectivity – the thing itself – [that which is performed as a free act]; the other relates to the Form of Freedom, involving the consciousness of his activity on the part of the individual; for Freedom demands that the individual recognize himself in such acts, that they should be veritably his, it being his interest that the result in question should be attained. The three elements and powers of the State in actual working must be contemplated according to the above analysis, their examination in detail being referred to the Lectures on the Philosophy of Right.

(1.) *Laws* of Rationality – of intrinsic Right – Objective or Real Freedom: to this category belong Freedom of Property and Freedom of Person. Those relics of that condition of servitude which the feudal relation had introduced are hereby swept away, and all those fiscal ordinances which

were the bequest of the feudal law – its tithes and dues, are abrogated. Real [practical] Liberty requires moreover freedom in regard to trades and professions – the permission to every one to use his abilities without restriction – and the free admission to all offices of State. This is a summary of the elements of real Freedom, and which are not based on feeling – for feeling allows of the continuance even of serfdom and slavery – but on the thought and self- consciousness of man recognizing the spiritual character of his existence.

(2.) But the agency which gives the laws practical effect is the *Government* generally. Government is primarily the formal execution of the laws and the maintenance of their authority: in respect to foreign relations it prosecutes the interest of the State; that is, it assists the independence of the nation as an individuality against other nations; lastly, it has to provide for the internal weal of the State and all its classes – what is called administration: for it is not enough that the citizen is allowed to pursue a trade or calling, it must also be a source of gain to him; it is not enough that men are permitted to use their powers, they must also find an opportunity of applying them to purpose. Thus the State involves a body of abstract principles and a practical application of them. This application must be the work of a subjective will, a will which resolves and decides. Legislation itself – the invention and positive enactment of these statutory arrangements, is an application of such general principles. The next step, then, consists in [specific] determination and execution. Here then the question presents itself: what is the decisive will to be? The ultimate decision is the prerogative of the monarch: but if the State is based on Liberty, the many wills of individuals also desire to have a share in political decisions. But the *Many* are *All;* and it seems but a poor expedient, rather a monstrous inconsistency, to allow only a few to take part in those decisions, since each wishes that his volition should have a share in determining what

is to be law for him. The Few assume to be the *deputies,* but they are often only the *despoilers* of the Many. Nor is the sway of the Majority over the Minority a less palpable inconsistency.

(3.) This collision of subjective wills leads therefore to the consideration of a third point, that of *Disposition* – an *ex animo* acquiescence in the laws; not the mere customary observance of them, but the cordial recognition of laws and the Constitution as in principle fixed and immutable, and of the supreme obligation of individuals to subject their particular wills to them. There may be various opinions and views respecting laws, constitution and government, but there must be a disposition on the part of the citizens to regard all these opinions as subordinate to the substantial interest of the State, and to insist upon them no further than that interest will allow; moreover nothing must be considered higher and more sacred than good will towards the State; or, if Religion be looked upon as higher and more sacred, it must involve nothing really alien or opposed to the Constitution. It is, indeed, regarded as a maxim of the profoundest wisdom entirely to separate the laws and constitution of the State from Religion, since bigotry and hypocrisy are to be feared as the results of a State Religion. But although the aspects of Religion and the State are different, they are radically *one*; and the laws find their highest confirmation in Religion.

Here it must be frankly stated, that with the Catholic Religion no rational constitution is possible; for Government and People must reciprocate that final guarantee of Disposition, and can have it only in a Religion that is not opposed to a rational political constitution.

Plato in his Republic makes everything depend upon the Government, and makes Disposition the principle of the State; on which account he lays the chief stress on Education. The modern theory is diametrically opposed to this, referring everything to the individual will. But here we have no

guarantee that the will in question has that right disposition which is essential to the stability of the State.

In view then of these leading considerations we have to trace the course of the *French Revolution* and the remodelling of the State in accordance with the Idea of Right. In the first instance purely abstract philosophical principles were set up: Disposition and Religion were not taken into account. The first Constitutional form of Government in France was one which recognized Royalty; the monarch was to stand at the head of the State, and on him in conjunction with his Ministers was to devolve the executive power; the legislative body on the other hand were to make the laws. But this constitution involved from the very first an internal contradiction; for the legislature absorbed the whole power of the administration: the budget, affairs of war and peace, and the levying of the armed force were in the hands of the Legislative Chamber. Everything was brought under the head of Law. The budget however is in its nature something diverse from law, for it is annually renewed, and the power to which it properly belongs is that of the Government. With this moreover is connected the indirect nomination of the ministry and officers of state, etc. The government was thus transferred to the Legislative Chamber, as in England to the Parliament. This constitution was also vitiated by the existence of absolute mistrust; the dynasty lay under suspicion, because it had lost the power it formerly enjoyed, and the priests refused the oath. Neither government nor constitution could be maintained on this footing, and the ruin of both was the result. A government of some kind however is always in existence. The question presents itself then, Whence did it emanate? Theoretically, it proceeded from the people; really and truly from the National Convention and its Committees. The forces now dominant are the abstract principles – Freedom, and, as it exists within the limits of the Subjective Will – Virtue. This Virtue has now to conduct the government in

opposition to the Many, whom their corruption and attachment to old interests, or a liberty that has degenerated into license, and the violence of their passions, render unfaithful to virtue. Virtue is here a simple abstract principle and distinguishes the citizens into two classes only – those who are favorably disposed and those who are not. But disposition can only be recognized and judged of by disposition. *Suspicion* therefore is in the ascendant; but virtue, as soon as it becomes liable to suspicion, is already condemned. Suspicion attained a terrible power and brought to the scaffold the Monarch, whose subjective will was in fact the religious conscience of a Catholic. Robespierre set up the principle of Virtue as supreme, and it may be said that with this man Virtue was an earnest matter. *Virtue* and *Terror* are the order of the day; for Subjective Virtue, whose sway is based on disposition only, brings with it the most fearful tyranny. It exercises its power without legal formalities, and the punishment it inflicts is equally simple – *Death.* This tyranny could not last; for all inclinations, all interests, reason itself revolted against this terribly consistent Liberty, which in its concentrated intensity exhibited so fanatical a shape. An organized government is introduced, analogous to the one that had been displaced; only that its chief and monarch is now a mutable Directory of Five, who may form a moral, but have not an individual unity; under them also suspicion was in the ascendant, and the government was in the hands of the legislative assemblies; this constitution therefore experienced the same fate as its predecessor, for it had proved to itself the absolute necessity of a governmental *power. Napoleon* restored it as a military power, and followed up this step by establishing himself as an individual will at the head of the State: he knew how to rule, and soon settled the internal affairs of France. The *avocats,* idealogues and abstract-principle men who ventured to show themselves he sent "to the right about," and the sway of mistrust was exchanged for that of respect and fear. He then, with the vast might of his

character turned his attention to foreign relations, subjected all Europe, and diffused his liberal institutions in every quarter. Greater victories were never gained, expeditions displaying greater genius were never conducted: but never was the powerlessness of Victory exhibited in a clearer light than then. The disposition of the peoples, *i.e.* their religious disposition and that of their nationality, ultimately precipitated this colossus; and in France constitutional monarchy, with the "Charte" as its basis, was restored. But here again the antithesis of Disposition [good feeling] and Mistrust made its appearance. The French stood in a mendacious position to each other, when they issued addresses full of devotion and love to the monarchy, and loading it with benediction. A fifteen years' farce was played. For although the *Charte* was the standard under which all were enrolled, and though both parties had sworn to it, yet on the one side the ruling disposition was a Catholic one, which regarded it as a matter of conscience to destroy the existing institutions. Another breach, therefore, took place, and the Government was overturned. At length, after forty years of war and confusion indescribable, a weary heart might fain congratulate itself on seeing a termination and tranquillization of all these disturbances. But although one main point is set at rest, there remains on the one hand that rupture which the Catholic principle inevitably occasions, on the other hand that which has to do with men's subjective will. In regard to the latter, the main feature of incompatibility still presents itself, in the requirement that the ideal general will should also be the *empirically* general – *i.e.* that the units of the State, in their individual capacity, should rule, or at any rate take part in the government. Not satisfied with the establishment of rational rights, with freedom of person and property, with the existence of a political organization in which are to be found various circles of civil life each having its own functions to perform, and with that influence over the people which is exercised by the intelligent members of the community, and the

confidence that is felt in them, “*Liberalism*” sets up in opposition to all this the atomistic principle, that which insists upon the sway of individual wills; maintaining that all government should emanate from their express power, and have their express sanction. Asserting this formal side of Freedom – this abstraction – the party in question allows no political organization to be firmly established. The particular arrangements of the government are forthwith opposed by the advocates of Liberty as the mandates of a particular will, and branded as displays of arbitrary power. The will of the Many expels the Ministry from power, and those who had formed the Opposition fill the vacant places; but the latter having now become the Government, meet with hostility from the Many, and share the same fate. Thus agitation and unrest are perpetuated. This collision, this nodus, this problem is that with which history is now occupied, and whose solution it has to work out in the future.

2. We have now to consider the French Revolution in its organic connection with the *History of the World*; for in its substantial import that event is World-Historical, and that contest of Formalism which we discussed in the last paragraph must be properly distinguished from its wider bearings. As regards outward diffusion its principle gained access to almost all modern states, either through conquest or by express introduction into their political life. Particularly all the Romanic nations, and the Roman Catholic World in special – *France, Italy, Spain* – were subjected to the dominion of Liberalism. But it became bankrupt everywhere; first, the grand firm in France, then its branches in Spain and Italy; twice, in fact, in the states into which it had been introduced. This was the case in Spain, where it was first brought in by the Napoleonic Constitution, then by that which the Cortes adopted – in Piedmont, first when it was incorporated with the French Empire, and a second time as the result of internal insurrection; so in Rome and in Naples it was twice set up. Thus Liberalism as an

abstraction, emanating from France, traversed the Roman World; but Religious slavery held that world in the fetters of political servitude. For it is a false principle that the fetters which bind Right and Freedom can be broken without the emancipation of conscience – that there can be a Revolution without a Reformation. – These countries, therefore, sank back into their old condition – in Italy with some modifications of the outward political condition. Venice and Genoa, those ancient aristocracies, which could at least boast of legitimacy, vanished as rotten despotisms. Material superiority in power can achieve no enduring results: Napoleon could not coerce Spain into freedom any more than Philip II could force Holland into slavery.

Contrasted with these Romanic nations we observe the other powers of Europe, and especially the Protestant nations. *Austria* and *England* were not drawn within the vortex of internal agitation, and exhibited great, immense proofs of their internal solidity. *Austria* is not a Kingdom, but an Empire, *i.e.,* an aggregate of many political organizations. The inhabitants of its chief provinces are not German in origin and character, and have remained unaffected by "ideas." Elevated neither by education nor religion, the lower classes in some districts have remained in a condition of serfdom, and the nobility have been kept down, as in Bohemia; in other quarters, while the former have continued the same, the barons have maintained their despotism, as in Hungary. Austria has surrendered that more intimate connection with Germany which was derived from the imperial dignity, and renounced its numerous possessions and rights in Germany and the Netherlands. It now takes its place in Europe as a distinct power, involved with no other. *England,* with great exertions, maintained itself on its old foundations ; the English *Constitution* kept its ground amid the general convulsion, though it seemed so much the more liable to be affected by it, as a public Parliament, that habit of assembling in public meeting which

was common to all orders of the state, and a free press, offered singular facilities for introducing the French principles of Liberty and Equality among all classes of the people. Was the English nation too backward in point of culture to apprehend these general principles? Yet in no country has the question of Liberty been more frequently a subject of reflection and public discussion. Or was the English constitution so entirely a Free Constitution – had those principles been already so completely realized in it, that they could no longer excite opposition or even interest? The English nation may be said to have approved of the emancipation of France; but it was proudly reliant on its own constitution and freedom, and instead of imitating the example of the foreigner, it displayed its ancient hostility to its rival, and was soon involved in a popular war with France.

The Constitution of England is a complex of mere *particular Rights* and particular privileges: the Government is essentially administrative – that is, conservative of the interests of all particular orders and classes; and each particular Church, parochial district, county, society, takes care of itself, so that the Government, strictly speaking, has nowhere less to do than in England. This is the leading feature of what Englishmen call their Liberty, and is the very antithesis of such a centralized administration as exists in France, where down to the least village the Maire is named by the Ministry or their agents. Nowhere can people less tolerate free action on the part of others than in France: there the Ministry combines in itself all administrative power, to which, on the other hand, the Chamber of Deputies lays claim. In England, on the contrary, every parish, every subordinate division and association has a part of its own to perform. Thus the common interest is concrete, and particular interests are taken cognizance of and determined in view of that common interest. These arrangements, based on particular interests, render a general system impossible. Consequently, abstract and general principles have no attraction for Englishmen – are

addressed in their case to inattentive ears. – The particular interests above referred to have positive rights attached to them, which date from the antique times of Feudal Law, and have been preserved in England more than in any other country. By an inconsistency of the most startling kind, we find them contravening equity most grossly; and of institutions characterized by real freedom there are nowhere fewer than in England. In point of private right and freedom of possession they present an incredible deficiency: sufficient proof of which is afforded in the rights of primogeniture, involving the necessity of purchasing or otherwise providing military or ecclesiastical appointments for the younger sons of the aristocracy.

The *Parliament governs,* although Englishmen are unwilling to allow that such is the case. It is worthy of remark, that what has been always regarded as the period of the corruption of a republican people, presents itself here; viz. election to seats in parliament by means of bribery. But this also they call freedom – the power to sell one's vote, and to purchase a seat in parliament.

But this utterly inconsistent and corrupt state of things has nevertheless one advantage, that it provides for the possibility of a government – that it introduces a majority of men into parliament who are statesmen, who from their very youth have devoted themselves to political business and have worked and lived in it. And the nation has the correct conviction and perception that there must be a government, and is therefore willing to give its confidence to a body of men who have had experience in governing; for a general sense of particularity involves also a recognition of that form of particularity which is a distinguishing feature of one class of the community – that knowledge, experience, and facility acquired by practice, which the aristocracy who devote themselves to such interests exclusively possess. This is quite opposed to the appreciation of principles and abstract views

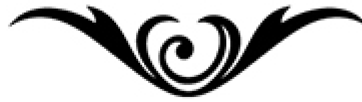
which everyone can understand at once, and which are besides to be found in all Constitutions and Charters. It is a question whether the Reform in Parliament now on the tapis, consistently carried out, will leave the possibility of a Government.

The material existence of England is based on commerce and industry, and the English have undertaken the weighty responsibility of being the missionaries of civilization to the world; for their commercial spirit urges them to traverse every sea and land, to form connections with barbarous peoples, to create wants and stimulate industry, and first and foremost to establish among them the conditions necessary to commerce, viz. the relinquishment of a life of lawless violence, respect for property, and civility to strangers.

Germany was traversed by the victoriouss French hosts, but German nationality delivered it from this yoke. One of the leading features in the political condition of Germany is that code of Rights which was certainly occasioned by French oppression, since this was the especial means of bringing to light the deficiencies of the old system. The fiction of an Empire has utterly vanished. It is broken up into sovereign states. Feudal obligations are abolished, for freedom of property and of person have been recognized as fundamental principles. Offices of State are open to every citizen, talent and adaptation being of course the necessary conditions. The government rests with the official world, and the personal decision of the monarch constitutes its apex; for a final decision is, as was remarked above, absolutely necessary. Yet with firmly established laws, and a settled organization of the State, what is left to the sole arbitrament of the monarch is, in point of substance, no great matter. It is certainly a very fortunate circumstance for a nation, when a sovereign of noble character falls to its lot; yet in a great state even this is of small moment, since its strength lies in the Reason incorporated in it. Minor states have their existence and

tranquillity secured to them more or less by their neighbors: they are therefore, properly speaking, not independent, and have not the fiery trial of war to endure. As has been remarked, a share in the government may be obtained by every one who has a competent knowledge, experience, and a morally regulated will. Those who oi airstoi, not ignorance and the presumptuous conceit of "knowing better." Lastly, as to Disposition, we have already remarked that in the Protestant Church the reconciliation of Religion with Legal Right has taken place. In the Protestant world there is no sacred, no religious conscience in a state of separation from, or perhaps even hostility to Secular Right.

This is the point which consciousness has attained, and these Mr. G. H. Lewes, in his *Biographical History of Philosophy*, Vol. IV, Ed. 1841.



I cannot mention any work that will serve as a compendium of the course, but I may remark that in my "Outlines of the Philosophy of Law," §§341-360, I have already given a definition of such a Universal History as it is proposed to develop, and a syllabus of the chief elements or periods into are the principal phases of that form in which the principle of Freedom has realized itself; – for the History of the World is nothing but the development of the Idea of Freedom. But Objective Freedom – the laws of *real* Freedom – demand the subjugation of the mere contingent Will – for this is in its nature formal. If the Objective is in itself Rational, human insight and conviction must correspond with the Reason which it embodies, and then we have the other essential element – Subjective Freedom – also realized. We have confined ourselves to the consideration of that progress of the Idea [which has led to this consummation], and have been obliged to forego the pleasure of giving a detailed picture of the prosperity, the periods of glory that have distinguished the career of peoples, the beauty and grandeur of the character of individuals, and the interest attaching to their fate in weal or woe. Philosophy concerns itself only with the glory of the

Idea mirroring itself in the History of the World. Philosophy escapes from the weary strife of passions that agitate the surface of society into the calm region of contemplation; that which interests it is the recognition of the process of development which the Idea has passed through in realizing itself – *i.e.,* the Idea of Freedom, whose reality is the consciousness of Freedom and nothing short of it.

That the History of the World, with all the changing scenes which its annals present, is this process of development and the realization of Spirit – this is the true *Theodicaea,* the justification of God in History. Only *this* insight can reconcile Spirit with the History of the World – viz., that what has happened, and is happening every day, is not only not "without God," but is essentially His Work.

Philosophy of History

INTRODUCTION

THE SUBJECT OF this course of Lectures is the Philosophical History of the World. And by this must be understood, not a collection of general observations respecting it, suggested by the study of its records, and proposed to be illustrated by its facts, but Universal History itself.

I cannot mention any work that will serve as a compendium of the course, but I may remark that in my *The Philosophy of Right* §§. 341-360, I have already given a definition of such a Universal History as it is proposed to develop, and a syllabus of the chief elements or periods into which it naturally divides itself.

To gain a clear idea at the outset, of the nature of our task, it seems necessary to begin with an examination of the other methods of treating History. The various methods may be ranged under three heads:

III. THE COURSE OF THE WORLD’S HISTORY

I. ORIGINAL HISTORY

§ 1

OF THE FIRST kind, the mention of one or two distinguished names will furnish a definite type. To this category belong *Herodotus, Thucydides*, and other historians of the same order, whose descriptions are for the most part limited to deeds, events, and states of society, which they had before their eyes, and whose spirit they shared. They simply transferred what was passing in the world around them, to the realm of representative intellect. An external phenomenon is thus translated into an internal conception. In the same way the poet operates upon the material supplied him by his emotions, projecting it into an image for the conceptive faculty. These original historians did, it is true, find statements and narratives of other men ready to hand. One person cannot be an eye and ear witness of everything. But they make use of such aids only as the poet does of that heritage of an already-formed language, to which he owes so much; merely as an ingredient. Historiographers bind together the fleeting elements of story, and treasure them up for immortality in the Temple of Mnemosyne. Legends, Ballad-stories, Traditions must be excluded from such original history. These are but dim and hazy forms of historical apprehension, and therefore belong to nations whose intelligence is but half awakened. Here, on the contrary, we have to do with people fully conscious of what they were and what they were about. The domain of reality — actually seen, or capable of being so — affords a very different basis in point of firmness from that fugitive and shadowy element, in which were engendered those legends and poetic dreams whose historical prestige vanishes, as soon as nations have attained a mature individuality.

§ 2

Such original historians, then, change the events, the deeds and the states of society with which they are conversant, into an object for the conceptive faculty. The narratives they leave us cannot, therefore, be very comprehensive in their range. Herodotus, Thucydides, Guieciardini, may be taken as fair samples of the class in this respect. What is present and living in their environment, is their proper material. The influences that have formed the writer are identical with those which have moulded the events that constitute the matter of his story. The author's spirit, and that of the actions he narrates, is one and the same. He describes scenes in which he himself has been an actor, or at any rate an interested spectator. It is short periods of time, individual shapes of persons and occurrences, single unreflected traits, of which be makes his picture. And his aim is nothing more than the presentation to posterity of an image of events as clear as that which be himself possessed in virtue of personal observation, or life-like descriptions. Reflections are none of his business, for he lives in the spirit of his subject; he has not attained an elevation above it. If, as in Caesar's case, he belongs to the exalted rank of generals or statesmen, it is the prosecution of *his own aims* that constitutes the history.

§ 3

Such speeches as we find in Thucydides (for example) of which we can positively assert that they are not *bona fide* reports, would seem to make against our statement that a historian of his class presents us no reflected picture; that persons and people appear in his works in *propria persona.* Speeches, it must be allowed, are veritable transactions in the human commonwealth; in fact, very gravely influential transactions. It is, indeed, often said, "Such and such things are only talk"; by way of demonstrating

their harmlessness. That for which this excuse is brought, may be mere "talk"; and talk enjoys the important privilege of being harmless. But addresses of peoples to peoples, or orations directed to nations and to princes, are integrant constituents of history. Granted such orations as those of Pericles — the most profoundly accomplished, genuine, noble statesman — were elaborated by Thucydides; it must yet be maintained that they were not foreign to the character of the speaker. In the oration in question, these men proclaim the maxims adopted by their countrymen, and which formed their own character; they record their views of their political relations, and of their moral and spiritual nature; and the principle of their designs and conduct. What the historian puts into their mouths is no supposititious system of ideas, but an uncorrupted transcript of their intellectual and moral habitudes.

§ 4

Of these historians, whom we must make thoroughly our own, with whom we must linger long, if we would live with their respective nations, and enter deeply into their spirit: of these historians, to whose pages we may turn not for the purpose of erudition merely, but with a view to deep and genuine enjoyment, there are fewer than might be imagined. Herodotus the *Father, i.e.* the *Founder* of History and Thucydides have been already mentioned. Xenophon's *Retreat of the Ten Thousand* is a work equally original. Caesar's *Commentaries* are the simple masterpiece of a mighty spirit. Among the ancients, these annalists were necessarily great captains and statesmen. In the Middle Ages, if we except the Bishops, who were placed in the very centre of the political world, the Monks monopolise this category as naive chroniclers who were as decidedly *isolated* from active life as those elder annalists had been connected with it. In modern times the relations are entirely altered. Our culture is essentially comprehensive and

immediately changes all events into historical representations. Belonging to the class in question, we have vivid, simple, clear narrations — especially of military transactions — which might fairly take their place with those of Caesar. In richness of matter and fullness of detail as regards strategic appliances, and attendant circumstances, they are even more instructive. The French “Memoires” also fall under this category. In many cases these are written by men of mark, though relating to affairs of little note. They not unfrequently contain a large proportion of anecdotal matter, so that the ground they occupy is narrow and trivial. Yet they are often veritable masterpieces in history; as those of Cardinal Retz, which in fact trench on a larger historical field. In Germany such masters are rare. Frederick the Great (*Histoire de mon temps*) is an illustrious exception. Writers of this order must occupy an elevated position. Only from such a position is it possible to take an extensive view of affairs — to see everything. This is out of the question for him, who from below merely gets a glimpse of the great world through a miserable cranny.

II. REFLECTIVE HISTORY

§ 5

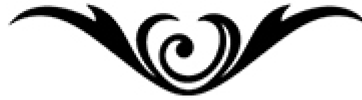
THE SECOND KIND of history we may call the *reflective.* It is history whose mode of representation is not really confined by the limits of the time to which it relates, but whose spirit transcends the present. In this second order strongly marked variety of species may be distinguished.

1. UNIVERSAL HISTORY

§ 6

IT IS THE aim of the investigator to gain a view of the entire history of a people or a country, or of the world, in short, what we call *Universal History*. In this case the working up of the historical material is the main point. The workman approaches his task with his *own* spirit; a spirit distinct from that of the element he is to manipulate. Here a very important consideration will be the principles to which the author refers, the bearing and motives of the actions and events which he describes, and those which determine the form of his narrative. Among us Germans this reflective treatment and the display of ingenuity which it occasions, assume a manifold variety of phases. Every writer of history proposes to himself an original method. The English and French confess to general principles of historical composition. Their standpoint is more that of cosmopolitan or of national culture. Among us each labours to invent a purely individual point of view. Instead of writing history, we are always beating our brains to discover how history ought to be written. This first kind of Reflective History is most nearly akin to the preceding, when it has no farther aim than to present the annals of a country complete. Such compilations (among which may be reckoned the works of Livy, Diodorus Siculus, Johannes von Müller's History of Switzerland) are, if well performed, highly meritorious. Among the best of the kind may be reckoned such annalist as approach those of the first class; who give so vivid a transcript of events that the reader may well fancy himself listening to contemporaries and eye-witnesses. But it often happens that the individuality of tone which must

characterise a writer belonging to a different culture, is not modified in accordance with the periods such a record must traverse. The spirit of the writer is quite other than that of the times of which he treats. Thus Livy puts into the mouths of the old Roman kings, consuls, and generals, such orations as would be delivered by an accomplished advocate of the Livian era, and which strikingly contrast with the genuine traditions of Roman antiquity (e.g. the fable of Menenius Agrippa). In the same way he gives us descriptions of battles, as if he bad been an actual spectator; but whose features would serve well enough for battles in any period, and whose distinctness contrasts on the other hand with the want of connection and the inconsistency that prevail elsewhere, even in his treatment of chief points of interest. The difference between such a compiler and an original historian may be best seen by comparing Polybius himself with the style in which Livy uses, expands, and abridges his annals in those period; of which Polybius's account has been preserved. Johann von Müller has given a stiff, formal, pedantic aspect of history, in the endeavour to remain faithful in his portraiture to the times he describes. We much prefer the narratives we find in old Tschudy. All is more naive and natural than it appears in the garb of a fictitious and affected archaism.



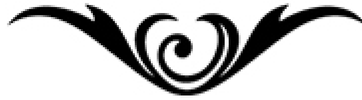
§ 7

A history which aspires to traverse long periods of time, or to be universal, must indeed forego the attempt to give individual representations of the past as it actually existed. It must foreshorten its pictures by abstractions; and this includes not merely the omission of events and deeds, but whatever is involved in the fact that Thought is, after all, the most trenchant epitomist. A battle, a great victory, a siege, no longer maintains its original proportions, but is put off with a bare mention. When Livy *e.g.* tells us of

the wars with the Volsci, we sometimes have the brief announcement: “This year war was carried on with the Volsci.”

2. PRAGMATICAL HISTORY

§ 8



A SECOND SPECIES of Reflective History is what we may call the *Pragmatical*. When we have to deal with the Past, and occupy ourselves with a remote world a Present rises into being for the mind - produced by its own activity, as the reward of its labour. The occurrences are, indeed, various; but the idea which pervades them - their deeper import and connection - is *one*. This takes the occurrence out of the category of the Past and makes it virtually Present. Pragmatical (didactic) reflections, though in their nature decidedly abstract, are truly and indefeasibly of the Present, and quicken the annals of the dead Past with the life of today. Whether, indeed such reflections are truly interesting and enlivening, depends on the writer's own spirit. Moral reflections must here be specially noticed, - the moral teaching expected from history; which latter has not unfrequently been treated with a direct view to the former. It may be allowed that examples of virtue elevate the soul, and are applicable in the moral instructions of children for impressing excellence upon their minds. But the destinies of peoples and states, their interests, relations, and the complicated issue of their affairs, present quite another field. Rulers, Statesmen, Nations, are wont to be emphatically commended to the teaching which experience offers in history. But what experience and history teach is this, - that peoples and governments never have learned anything from history, or acted on principles deduced from it. Each period is involved in such peculiar circumstances, exhibits a condition of things so strictly idiosyncratic, that its conduct must be regulated by considerations

connected with itself, and itself alone. Amid the pressure of great events, a general principle gives no help. It is useless to revert to similar circumstances in the Past. The pallid shades of memory struggle in vain with the life and freedom of the Present. Looked at in this light, nothing can be shallower than the oft-repeated appeal to Greek and Roman examples during the French Revolution. Nothing is more diverse than the genius of those nations and that of our times. Johannes v. Müller, in his Universal History as also in his History of Switzerland, had such moral aims in view. He designed to prepare a body of political doctrines for the instruction of princes, governments and peoples (he formed a special collection of doctrines and reflections, - frequently giving us in his correspondence the exact number of apophthegms which he had compiled in a week); but he cannot reckon this part of his labour as among the best that he accomplished. It is only a thorough, liberal, comprehensive view of historical relations (such *e.g.* as we find in Montesquieu's *Esprit des Loix*), that can give truth and interest to reflections of this order. One Reflective History therefore supersedes another. The materials are patent to every writer: each is likely enough to believe himself capable of arranging and manipulating them; and we may expect that each will insist upon his own spirit as that of the age in question. Disgusted by such reflective histories readers have often returned to a with pleasure to a narrative adopting no particular point of view. These certainly have their value; but for the most part they offer only material for history. We Germans are not content with such. The French, on the other hand, display great genius in reanimating bygone times, and in bringing the past to bear upon the present conditions of things.

3. CRITICAL HISTORY

§ 9

THE THIRD FORM of Reflective History is the *Critical*. This deserves mention as pre-eminently the mode of treating history, now current in Germany. It is not history itself that is here presented. We might more properly designate it as a History of History; a criticism of historical narratives and an investigation of their truth and credibility. Its peculiarity in point of fact and of intention, consists in the acuteness with which the writer extorts something from the records which was not in the matters recorded. The French have given as much that is profound and judicious in this class of composition. But they have not endeavoured to pass a merely critical procedure for substantial history. They have duly presented their judgments in the form of critical treatises. Among us, the so-called “higher criticism,” which reigns supreme in the domain of philology, has also taken possession of our historical literature. This “higher criticism” has been the pretext for introducing all the anti-historical monstrosities that a vain imagination could suggest. Here we have the other method of making the past a living reality; putting subjective fancies in the place of historical data; fancies whose merit is measured by their boldness, that is, the scantiness of the particulars on which they are based, and the peremptoriness with which they contravene the best established facts of history.

§ 10

4. The last species of Reflective History announces its fragmentary character on the very face of it. It adopts an abstract position; yet, since it

takes general points of view (*e.g.* as the History of Art, of Law, of Religion), it forms a transition to the Philosophical History of the World. In our time this form of the history of ideas has been more developed and brought into notice. Such branches of national life stand in close relation to the entire complex of a people's annals; and the question of chief importance in relation to our subject is, whether the connection of the whole is exhibited in its truth and reality, or referred to merely external relations. In the latter case, these important phenomena (Art., Law, Religion, &c.) appear as purely accidental national peculiarities. It must be remarked that, when Reflective History has advanced to the adoption of general points of view, if the position taken is a true one, these are found to constitute - not merely external thread, a superficial series - but are the inward guiding soul of the occurrences and actions that occupy a nation's annals. For, like the soul-conductor Mercury, the Idea is in truth, the leader of peoples and of the World; and Spirit, the rational and necessitated will of that conductor, is and has been the director of the events of the World's History. To become acquainted with Spirit in this its office of guidance, is the object of our present undertaking. This brings us to ...

III. PHILOSOPHIC HISTORY

§ 11

THE THIRD KIND of history, — the *Philosophical*. No explanation was needed of the two previous classes; their nature was self-evident. It is otherwise with this last, which certainly seems to require an exposition or justification. The most general definition that can be given, is, that the Philosophy of History means nothing but the *thoughtful consideration of it*. Thought is, indeed., essential to humanity. It is this that distinguishes us from the brutes. In sensations cognition and intellection; in our instincts and volitions, as far as they are truly human Thought is an invariable element. To insist upon Thought in this connection with history, may, however, appear unsatisfactory. In this science it would seem as if Thought must be subordinate to what is given to the realities of fact; that this is its basis and guide: while Philosophy dwells in the region of self-produced ideas, without reference to actuality. Approaching history thus prepossessed, Speculation might be expected to treat it as a mere passive material; and, so far from leaving it in its native truth, to force it into conformity with a tyrannous idea, and to construe it, as the phrase is, *"à priori."* But as it is the business of history simply to adopt into its records what is and has been, actual occurrences and transactions; and since it remains true to its character in proportion as it strictly adheres to its data, we seem to have in Philosophy, a process diametrically opposed to that of the historiographer. This contradiction, and the charge consequent brought against speculation, shall be explained and confuted. We do not, however, propose to correct the innumerable special misrepresentations, trite or novel, that are current

respecting the aims, the interests, and the modes of treating history, and its relation to Philosophy.

§ 12

The only Thought which Philosophy brings with it to the contemplation of History, is the simple conception *of Reason*; that Reason is the Sovereign of the World; that the history of the world therefore, presents us with a rational process. This conviction and intuition is a hypothesis in the domain of history as such. In that of Philosophy it is no hypothesis. It is there proved by speculative cognition, that Reason — and this term may here suffice us, without investigating the relation sustained by the Universe to the Divine Being, — is *Substance*, as well as *Infinite Power;* its own *Infinite Material* underlying all the natural and spiritual life which it originates, as also the Infinite Form, — that which sets this Material in motion. On the one hand, Reason is the *substance* of the Universe; viz. that by which and in which all reality has its being and subsistence. On the other hand, it is the *Infinite Energy* of the Universe; since Reason is not so powerless as to be incapable of producing anything but a mere ideal, a mere intention — having its place outside reality, nobody knows where; something separate and abstract, in the heads of certain human beings. It is *the infinite complex of things*, their entire Essence and Truth. It is its own material which it commits to its own Active Energy to work up; not needing, as finite action does, the conditions of an external material of given means from which it may obtain its support, and the objects of its activity. It supplies its own nourishment and is the object of its own operations. While it is exclusively its own basis of existence, and absolute final aim, it is also the energising power realising this aim; developing it not only in the phenomena of the Natural, but also of the Spiritual Universe — the History of the World. That this “Idea” or “Reason” is the True, *the Eternal*, the absolutely *powerful* essence; that it

reveals itself in the World, and that in that World nothing else is revealed but this and its honour and glory — is the thesis which, as we have said, has been proved in Philosophy and is here regarded as demonstrated.

§ 13

In those of my hearers who are not acquainted with Philosophy, I may fairly presume, at least, the existence of a *belief* in Reason, a desire, a thirst for acquaintance with it, in entering upon this course of Lectures. It is in fact, the wish for rational insight, not the ambition to amass a mere heap of acquisitions, that should be presupposed in every case as possessing the mind of the learner in the study of science. If the clear idea of Reason is not already developed in our minds, in beginning the study of Universal History, we should at least leave the firm, unconquerable faith that Reason *does* exist there; and that the World of intelligence and conscious volition is not abandoned to chance, but must show itself in the light of the self-cognisant Idea. Yet I am not obliged to make any such preliminary demand upon your faith. What I have said thus provisionally, and what I shall have further to say, is, even in reference to our branch of science, not to be regarded as hypothetical, but as a summary view of the whole; the *result of the investigation* we are about to pursue; a result which happens to be known to me, because I have traversed the entire field. It is only an inference from the history of the World, that its development has been a rational process; that the history in question has constituted the rational necessary course of the World Spirit — that Spirit whose nature is always one and the same, but which unfolds this its one nature in the phenomena of the World's existence. This must, as before stated, present itself as the ultimate result of History. But we have to take the latter as it is. We must proceed historically — empirically. Among other precautions we must take care not to be misled by professed historians who (especially among the

Germans, and enjoying a considerable authority), are chargeable with the very procedure of which they accuse the Philosopher — introducing *à priori* inventions of their own into the records of the Past. It is, for example, a widely current fiction, that there was an original primeval people, taught immediately by God, endowed with perfect insight and wisdom, possessing a thorough knowledge of all natural laws and spiritual truth; that there have been such or such sacerdotal peoples; or, to mention a more specific averment, that there was a Roman Epos, from which the Roman historians derived the early annals of their city, &c. Authorities of this kind we leave to those talented historians by profession, among whom (in Germany at least) their use is not uncommon. — We might then announce it as the first condition to be observed, that we should faithfully adopt all that is historical. But in such general expressions themselves, as "faithfully" and "adopt," lies the ambiguity. Even the ordinary, the "impartial" historiographer, who believes and professes that he maintains a simply receptive attitude; surrendering himself only to the data supplied him — is by no means passive as regards the exercise of his thinking powers. He brings his categories with him, and sees the phenomena presented to his mental vision, exclusively through these media. And, especially in all that pretends to the name of science, it is indispensable that Reason should not sleep — that reflection should be in full play. To him who looks upon the world rationally, the world in its turn, presents a rational aspect. The relation is mutual. But the various exercises of reflection — the different points of view — the modes of deciding the simple question of the relative importance of events (the first category that occupies the attention of the historian), do not belong to this place.

§ 14

I will only mention two phases and points of view that concern the generally diffused conviction that Reason has ruled, and is still ruling in the world, and consequently in the world's history; because they give us, at the same time, an opportunity for more closely investigating the question that presents the greatest difficulty, and for indicating a branch of the subject, which will have to be enlarged on in the sequel.

I. REASON GOVERNS THE WORLD

§ 15

One of these points is, that passage in history, which informs us that the Greek Anaxagoras was the first to enunciate the doctrine that Understanding generally, or Reason, governs the world. It is not intelligence as self-conscious Reason, — not a Spirit as such that is meant; and we must clearly distinguish these from each other. The movement of the solar system takes place according to unchangeable laws. These laws are Reason, implicit in the phenomena in question. But neither the sun nor the planets, which revolve around it according to these laws, can be said to have any consciousness of them.

§ 16

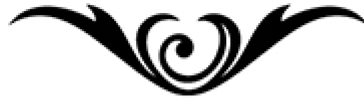
A thought of this kind, — that Nature is an embodiment of Reason; that it is unchangeably subordinate to universal laws, appears nowise striking or strange to us. We are accustomed to such conceptions, and find nothing extraordinary in them. And I have mentioned this extraordinary occurrence, partly to show how history teaches, that ideas of this kind, which may seem trivial to us, have not always been in the world; that on the contrary, such a thought makes an epoch in the annals of human intelligence. Aristotle says of Anaxagoras, as the originator of the thought in question, that he appeared as a sober man among the drunken. Socrates adopted the doctrine from Anaxagoras, and it forthwith became the ruling idea in Philosophy, except in the school of Epicurus, who ascribed all events to chance. "I was delighted with the sentiment," — Plato makes Socrates say— "and hoped I

had found a teacher who would show me Nature in harmony with Reason, who would demonstrate in each particular phenomenon its specific aim, and in the whole, the grand object of the Universe. I would not have surrendered this hope for a great deal. But how very much was I disappointed, when, having zealously applied myself to the writings of Anaxagoras, I found that he adduces only external causes, such as Atmosphere, Ether, Water, and the like.” It is evident that the defect which Socrates complains of respecting Anaxagoras’s doctrine, does not concern the principle itself, but the shortcoming of the propounder in applying it to Nature in the concrete. Nature is not deduced from that principle: the latter remains in fact a mere abstraction, inasmuch as the former is not comprehended and exhibited as a development of it, — an organisation produced by and from Reason. I wish, at the very outset, to call your attention to the important difference between a conception, a principle, a truth limited to an *abstract* form and its determinate application, and concrete development. This distinction affects the whole fabric of philosophy; and among other bearings of it there is one to which we shall have to revert at the close of our view of Universal History, in investigating the aspect of political affairs in the most recent period.

§ 17

We have next to notice the rise of this idea — that Reason directs the World — in connection with a further application of it, well known to us, — in the form, viz. of the *religious truth*, that the world is not abandoned to chance and external contingent causes, but that a *Providence* controls it. I stated above, that I would not make a demand on your faith, in regard to the principle announced. Yet I might appeal to your belief in it, *in this religious aspect*, if, as a general rule, the nature of philosophical science allowed it to attach authority to presuppositions. To put it in another shape, — this appeal

is forbidden, because the science of which we have to treat, proposes itself to furnish the proof (not indeed of the abstract *Truth* of the doctrine, but) of its correctness as compared with facts. The truth, then, that a Providence (that of God) presides over the events of the World — consorts with the proposition in question; for *Divine* Providence is Wisdom, endowed with an infinite Power which realises its aim, viz. the absolute rational-design of the World. Reason is Thought conditioning itself with perfect freedom. But a difference — rather a contradiction — will manifest itself, between this belief and our principle, just as was the case in reference to the demand made by Socrates in the case of Anaxagoras's dictum. For that belief is similarly indefinite; it is what is called a belief in a general Providence, and is not followed out into definite application, or displayed in its bearing on the grand total — the entire course of human history. But to *explain* History is to depict the passions of mankind, the genius, the active powers, that play their part on the great stage; and the providentially determined process which these exhibit, constitutes what is generally called the "plan" of Providence. Yet it is this very plan which is supposed to be concealed from our view: which it is deemed presumption, even to wish to recognise. The ignorance of Anaxagoras, as to how intelligence reveals itself in actual existence, was ingenuous. Neither in his consciousness, nor in that of Greece at large, had that thought been further expanded. He had not attained the power to apply his general principle to the concrete, so as to deduce the latter from the former. It was Socrates who took the first step in comprehending the union of the Concrete with the Universal. Anaxagoras, then, did not take up a *hostile* position towards such an application. The common belief in Providence *does;* at least it opposes the use of the principle on the large scale, and denies the possibility of discerning the plan of Providence. In isolated cases this plan is supposed to be manifest. Pious persons are encouraged to recognise in particular circumstances, something



more than mere chance; to acknowledge the guiding hand of God; e.g. when help has unexpectedly come to an individual in great perplexity and need. But these instances. of providential design are of a limited kind, and concern the accomplishment of nothing more than the desires of the individual in question. But in the history of the World, the *Individuals* we have to do with are *Peoples;* Totalities that are States. We cannot, therefore, be satisfied with what we may call this "peddling" view of Providence, to which the belief alluded to limits itself. Equally unsatisfactory is the merely abstract, undefined belief in a Providence, when that belief is not brought to bear upon the details of the process which it conducts. On the contrary our earnest endeavour must be directed to the recognition of the ways of Providence, the means it uses, and the historical phenomena in which it manifests itself; and we must show their connection with the general principle above mentioned. But in noticing the recognition of the plan of Divine Providence generally, I have implicitly touched upon a prominent question of the day; viz. that of the possibility of knowing God: or rather — since public opinion has ceased to allow it to be a matter of *question* — the *doctrine* that it is impossible to know God. In direct contravention of what is commanded in holy Scripture as the highest duty, — that we should not merely love, but know God, — the prevalent dogma involves the denial of what is there said; viz. that it is the Spirit (*der Geist*) that leads into Truth, knows all things, penetrates even into the deep things of the Godhead. While the Divine Being is thus placed beyond our knowledge, and outside the limit of all human things, we have the convenient licence of wandering as far as we list, in the direction of our own fancies. We are freed from the obligation to refer our knowledge to the Divine and True. On the other hand, the vanity and egotism which characterise it find, in this false position, ample justification and the pious modesty which puts far from it the knowledge of God, can well estimate how much furtherance thereby

accrues to its own wayward and vain strivings. I have been unwilling to leave out of sight the connection between our thesis - that Reason governs and has governed the World — and the question of the possibility of a Knowledge of God, chiefly that I might not lose the opportunity of mentioning the imputation against Philosophy of being shy of noticing religious truths, or of having occasion to be so in which is insinuated the suspicion that it has anything but a clear conscience in the presence of these truths. So far from this being the case, the fact is, that in recent times Philosophy has been obliged to defend the domain of religion against the attacks of several theological systems. In the Christian religion God has revealed Himself, — that is, he has given us to understand what He is; so that He is no longer a concealed or secret existence. And this possibility of knowing Him, thus afforded us, renders such knowledge a duty. God wishes no narrow-hearted souls or empty heads for his children; but those whose spirit is of itself indeed, poor, but rich in the knowledge of Him; and who regard this knowledge of God as the only valuable possession. That development of the thinking spirit, which has resulted from the revelation of the Divine Being as its original basis, must ultimately advance to the intellectual comprehension of what was presented in the first instance, to *feeling* and *imagination.* The time must eventually come for understanding that rich product of active Reason, which the History of the World offers to us. It was for a while the fashion to profess admiration for the wisdom of God, as displayed in animals, plants, and isolated occurrences. But, if it be allowed that Providence manifests itself in such objects and forms of existence, why not also in Universal History? This is deemed too great a matter to be thus regarded. But Divine Wisdom, i.e. Reason., is one and the same in the great as in the little; and we must not imagine God to be too weak to exercise his wisdom on the grand scale. Our intellectual striving aims at realising the conviction that what was *intended* by eternal wisdom,

is actually *accomplished* in the domain of existent, active Spirit, as well as in that of mere Nature. Our mode of treating the subject is, in this aspect, a Theodicaea, — a justification of the ways of God, — which Leibnitz attempted metaphysically in his method, i.e. in indefinite abstract categories, — so that the ill that is found in the World may be comprehended, and the thinking Spirit reconciled with the fact of the existence of evil. Indeed, nowhere is such a harmonising view more pressingly demanded than in Universal History; and it can be attained only by recognising the *positive* existence, in which that negative element is a subordinate, and vanquished nullity. On the one hand. the ultimate design of the World must be perceived; and, on the other hand, the fact that this design has been actually, realised in it, and that evil has not been able permanently to assert a competing position. But this conviction involves much more than the mere belief in a superintending or in "Providence." "Reason," whose sovereignty over the World has been maintained, is as indefinite a term as "Providence," supposing the term to be used by those who are unable to characterise it distinctly, — to show wherein it consists, so as to enable us to decide whether a thing is rational or irrational. An adequate definition of Reason is the first desideratum; and whatever boast may be made of strict adherence to it in explaining phenomena, — without such a definition we get no farther than mere words. With these observations we may proceed to the second point of view that has to be considered in this Introduction.

II. ESSENTIAL DESTINY OF REASON

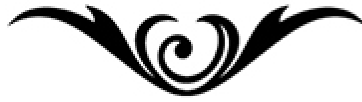
§ 18

THE ENQUIRY INTO the *essential destiny* of Reason — as far as it is considered in reference to the World — is identical with the question, *what is the ultimate design of the World?* And the expression implies that that design is destined to be realised. Two points of consideration suggest themselves: first, the *import* of this design — its abstract definition; and secondly, its *realisation.*

§ 19

It must be observed at the outset, that the phenomenon we investigate — Universal History — belongs to the realm of *Spirit.* The term "World," includes both physical and psychical Nature. Physical Nature also plays its part in the World's History, — and attention will have to be paid to the fundamental natural relations thus involved. But Spirit, and the course of its development, is our substantial object. Our task does not require us to contemplate Nature as a Rational System in itself — though in its own proper domain it proves itself such — but simply in its relation to *Spirit.* On the stage on which we are observing it, — Universal History — Spirit displays itself in its most concrete reality. Notwithstanding this (or rather for the very purpose of comprehending the *general* principles which this, its form of *concrete reality*, embodies) we must premise some abstract characteristics of the *nature of spirit.* Such an explanation, however, cannot be given here under any other form than that of bare assertion. The present is not the occasion for unfolding the idea of Spirit speculatively; for

whatever has a place in an Introduction, must, as already observed, be taken as simply historical; something assumed as having been explained and proved elsewhere; or whose demonstration awaits the sequel of the Science of History itself.



§ 20

We have therefore to mention here:

(1) The abstract characteristics of the nature of Spirit.
(2) What means Spirit uses in order to realise its Idea.
(3) Lastly, we must consider the shape which the perfect embodiment of Spirit assumes-the State.

(1) THE ABSTRACT CHARACTERISTICS OF THE NATURE OF SPIRIT

§ 21

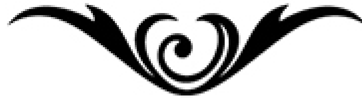
THE NATURE OF Spirit may be understood by a glance at its direct opposite — *Matter*. As the essence of Matter is Gravity, so, on the other hand, we may affirm that the substance, the essence of Spirit is Freedom. All will readily assent to the doctrine that Spirit, among other properties, is also endowed with Freedom; but philosophy teaches that all the qualities of Spirit exist only through Freedom; that all are but means for attaining Freedom; that all seek and produce this and this alone. It is a result of speculative Philosophy, that Freedom is the sole truth of Spirit. Matter possesses gravity in virtue of its tendency towards a central point. It is essentially composite; consisting of parts that *exclude* each other. It seeks its Unity; and therefore exhibits itself as self-destructive, as verging towards its opposite [an indivisible point]. If it could attain this, it would be Matter no longer, it would have perished. It strives after the realisation of its Idea; for in Unity it exists *ideally.* Spirit, on the contrary, may be defined as that which has its centre in itself. It has not a unity outside itself, but has already found it; it exists *in* and *with itself.* Matter has its essence out of itself; Spirit *is self-contained existence* (*Bei-sich-selbst-seyn*). Now this is Freedom, exactly. For if I am dependent, my being is referred to something else which I am not; I cannot exist independently of something external. I am free on the contrary, when my existence depends upon myself. This self-contained existence of Spirit is none other than self-consciousness — consciousness of one's own being. Two things must be distinguished in consciousness; first, the fact *that I know*; secondly, *what I know.* In *self* consciousness these

are merged in one; for Spirit *knows itself.* It involves an appreciation of its own nature, as also an energy enabling it to realise itself; to make itself actually that which it is *potentially*. According to this abstract definition it may be said of Universal History, that it is the exhibition of Spirit in the process of working out the knowledge of that which it is potentially. And as the germ bears in itself the whole nature of the tree, and the taste and form of its fruits, so do the first traces of Spirit virtually contain the whole of that History. The Orientals have not attained the knowledge that Spirit — Man *as such* — is free; and because they do not know this they are not free. They only know that *one is free.* But on this very account, the freedom of that one is only caprice; ferocity — brutal recklessness or passion, or a mildness and tameness of the desires, which is itself only an accident of Nature — mere caprice like the former. — That *one* is therefore only a Despot; not a *free* man. The consciousness of Freedom first arose among the Greeks, and therefore they were free; but they, and the Romans likewise, knew only that some are free, — not man as such. Even Plato and Aristotle did not know this. The Greeks, therefore, had slaves; and their whole life and the maintenance of their splendid liberty, was implicated with the institution of slavery: a fact moreover, which made that liberty on the one hand only an accidental, transient and limited growth; on the other hand, constituted it a rigorous thraldom of our common nature — of the Human. The German nations, under the influence of Christianity, were the first to attain the consciousness, that man, as man, is free: that it is the *freedom* of Spirit which constitutes its essence. This consciousness arose first in religion, the inmost region of Spirit; but to introduce the principle into the various relations of the actual world, involves a more extensive problem than its simple implantation; a problem whose solution and application require a severe and lengthened process of culture. In proof of this, we may note that slavery did not cease immediately on the reception of Christianity. Still less

did liberty predominate in States; or Governments and Constitutions adopt a rational organisation, or recognise freedom as their basis. That application of the principle to political relations; the thorough moulding and interpenetration of the constitution of society by it, is a process identical with history itself. I have already directed attention to the distinction here involved, between a principle as such, and *its application; i.e.* its introduction and carrying out in the actual phenomena of Spirit and Life. This is a point of fundamental importance in our science, and one which must be constantly respected as essential. And in the same way as this distinction has attracted attention in view of the *Christian* principle of self-consciousness — Freedom; it also shows itself as an essential one, in view of the principle of Freedom *generally.* The History of the world is none other than the progress of the consciousness of Freedom; a progress whose development according to the necessity of its nature, it is our business to investigate.

§ 22

The general statement given above, of the various grades in the consciousness of Freedom — and which we applied in the first instance to the fact that the Eastern nations knew only that *one* is free; the Greek and Roman world only that *some* are free; whilst *we* know that all men absolutely (man *as man*) are free, — supplies us with the natural division of Universal History, and suggests the mode of its discussion. This is remarked, however, only incidentally and anticipatively; some other ideas must be first explained.



§ 23

The destiny of the spiritual World, and, — since this is *the substantial World*, while the physical remains subordinate to it, or, in the language of

speculation, has no truth *as against* the spiritual, — the final *cause of the World at large*, we allege to be the *consciousness* of its own freedom on the part of Spirit, and *ipso facto*, the *reality* of that freedom. But that this term “Freedom,” without further qualification, is an indefinite, and incalculable ambiguous term; and that while that which it represents is the *ne plus ultra* of attainment, it is liable to an infinity of misunderstandings, confusions and errors, and to become the occasion for all imaginable excesses, — has never been more clearly known and felt than in modern times. Yet, for the present, we must content ourselves with the term itself without farther definition. Attention was also directed to the importance of the infinite difference between a principle in the abstract, and its realisation in the concrete. In the process before us, the essential nature of freedom - which involves in it absolute necessity, — is to be displayed as coming to a consciousness of itself (for it is in its very nature, self-consciousness) and thereby realising its existence. Itself is its own object of attainment, and the sole aim of Spirit. This result it is, at which the process of the World’s History has been continually aiming; and to which the sacrifices that have ever and anon been laid on the vast altar of the earth, through the long lapse of ages, have been offered. This is the only aim that sees itself realised and fulfilled; the only pole of repose amid the ceaseless change of events and conditions, and the sole efficient principle that pervades them. This final aim is God’s purpose with the world; but God is the absolutely perfect Being, and can, therefore, will nothing other than himself — his own Will. The Nature of His Will — that is, His Nature itself — is what we here call the Idea of Freedom; translating the language of Religion into that of Thought. The question, then, which we may next put, is: What means does this principle of Freedom use for its realisation? This is the second point we have to consider.

(2) THE MEANS SPIRIT USES TO REALISE ITS IDEA

§ 24

THE QUESTION OF the *means* by which Freedom develops itself to a World, conducts us to the phenomenon of History itself. Although Freedom is, primarily, an undeveloped idea, the means it uses are external and phenomenal; presenting themselves in History to our sensuous vision. The first glance at History convinces us that the actions of men proceed from their needs, their passions, their characters and talents; and impresses us with the belief that such needs, passions and interests are the sole springs of action — the efficient agents in this scene of activity. Among these may, perhaps, be found aims of a liberal or universal kind — benevolence it may be, or noble patriotism; but such virtues and general views are but insignificant as compared with the World and its doings. We may perhaps see the Ideal of Reason actualised in those who adopt such aims, and within the sphere of their influence; but they bear only a trifling proportion to the mass of the human race; and the extent of that influence is limited accordingly. Passions, private aims, and the satisfaction of selfish desires, are on the other hand, most effective springs of action. Their power lies in the fact that they respect none of the limitations which justice and morality would impose on them; and that these natural impulses have a more direct influence over man than the artificial and tedious discipline that tends to order and self-restraint, law and morality. When we look at this display of passions, and the consequences of their violence; the Unreason which is associated not ,only with them, but even (rather we might say *especially*) with *good* designs and righteous aims; when we see the evil, the vice, the

ruin that has befallen the most flourishing kingdoms which the mind of man ever created, we can scarce avoid being filled with sorrow at this universal taint of corruption: and, since this decay is not the work of mere Nature, but of the Human Will — a moral embitterment — a revolt of the Good Spirit (if it have a place within us) may well be the result of our reflections. Without rhetorical exaggeration, a simply truthful combination of the miseries that have overwhelmed the noblest of nations and polities, and the finest exemplars of private virtue, — forms a picture of most fearful aspect, and excites emotions of the profoundest and most hopeless sadness, counter-balanced by no consolatory result. We endure in beholding it a mental torture, allowing no defence or escape but the consideration that what has happened could not be otherwise; that it is a fatality which no intervention could alter. And at last we draw back from the intolerable disgust with which these sorrowful reflections threaten us, into the more agreeable environment of our individual life — the Present formed by our private aims and interests. In short we retreat into the selfishness that stands on the quiet shore, and thence enjoy in safety the distant spectacle of "wrecks confusedly hurled." But even regarding History as the slaughter-bench at which the happiness of peoples, the wisdom of States, and the virtue of individuals have been victimised — the question involuntarily arises — to what principle, to what final aim these enormous sacrifices have been offered. From this point the investigation usually proceeds to that which we have made the general commencement of our enquiry. Starting from this we pointed out those phenomena which made up a picture so suggestive of gloomy emotions and thoughtful reflections — as *the very field* which we, for our part, regard as exhibiting only the means for realising what we assert to be the essential destiny — the absolute aim, or — which comes to the same thing — the true *result* of the World's History. We have all along purposely eschewed "moral reflections" as a method of

rising from the scene of historical specialties to the general principles which they embody. Besides, it is not the interest of such sentimentalities, really to rise above those depressing emotions; and to solve the enigmas of Providence which the considerations that occasioned them, present. It is essential to their character to find a gloomy satisfaction in the empty and fruitless sublimities of that negative result. We return then to the point of view which we have adopted; observing that the successive steps (*Momente*) of the analysis to which it will lead us, will also evolve the conditions requisite for answering the enquiries suggested by the panorama of sin and suffering that history unfolds.

§ 25

The *first* remark we have to make, and which - though already presented more than once — cannot be too often repeated when the occasion seems to call for it, — is that what we call the *principle, aim, destiny*, or the nature and idea of Spirit, is something merely general and abstract. Principle — Plan of Existence — Law — is a hidden, undeveloped essence, which as such — however true in itself — is not completely real. Aims, principles, &c., have a place in our thoughts, in our subjective design only; but not yet in the sphere of reality. That which exists for itself only, is a possibility, a potentiality; but has not yet emerged into Existence. A *second* element must be introduced in order to produce actuality — viz. actuation, realisation; and whose motive power is the Will — the activity of man in the widest sense. It is only by this activity that that Idea as well as abstract characteristics generally, are realised, actualised; for of themselves they are powerless. The motive power that puts them in operation, and gives them determinate existence, is the need, instinct, inclination, and passion of man. That some conception of mine should be developed into act and existence, is my earnest desire: I wish to assert my personality in connection with it: I

wish to be satisfied by its execution. If I am to exert myself for any object, it must in some way or other be *my* object. In the accomplishment of such or such designs I must at the same time find *my* satisfaction; although the purpose for which I exert myself includes a complication of results, many of which have no interest for me. This is the absolute right of personal existence — to find *itself* satisfied in its activity and labour. If men are to interest themselves for anything, they must (so to speak) have part of their existence involved in it; find their individuality gratified by its attainment. Here a mistake must be avoided. We intend blame, and justly impute it as a fault, when we say of an individual, that he is "interested" (in taking part in such or such transactions) that is, seeks only his private advantage. In reprehending this we find fault with him for furthering his personal aims without any regard to a more comprehensive design; of which he takes advantage to promote his own interest, or which he even sacrifices with this view. But he who is active in *promoting an object*, is not simply "interested," but interested in that object itself. Language faithfully expresses this distinction. — Nothing therefore happens, nothing is accomplished, unless the individuals concerned, seek their own satisfaction in the issue. They are particular units of society; i.e. they have special needs, instincts, and interests generally, peculiar to themselves. Among these needs are not only such as we usually call necessities — the stimuli of individual desire and volition — but also those connected with individual views and convictions; or — to use a term expressing less decision — leanings of opinion; supposing the impulses of reflection, understanding, and reason, to have been awakened. In these cases people demand, if they are to exert themselves in any direction, that the object should commend itself to them; that in point of opinion, — whether as to its goodness, justice, advantage, profit, — they should be able to "enter into it" (*dabei seyn*). This is a consideration of especial importance in our age, when

people are less than formerly influenced by reliance on others, and by authority; when, on the contrary, they devote their activities to a cause on the ground of their own understanding, their independent conviction and opinion.

§ 26

We assert then that nothing has been accomplished without interest on the part of the actors; and — if interest be called passion, inasmuch as the whole individuality, to the neglect of all other actual or possible interests and claims, is devoted to an object with every fibre of volition, concentrating all its desires and powers upon it — we may affirm absolutely that *nothing great in the World* has been accomplished without *passion.* Two elements, therefore, enter into the object of our investigation; the first the Idea, the second the complex of human passions; the one the warp, the other the woof of the vast arras-web of Universal History. The concrete mean and union of the two is Liberty, under the conditions of morality in a State. We have spoken of the Idea of Freedom as the nature of Spirit, and the absolute goal of History. Passion is regarded as a thing of sinister aspect, as more or less immoral. Man is required to have no passions. Passion, it is true, is not quite the suitable word for what I wish to express. I mean here nothing more than human activity as resulting from private interests — special, or if you will, self-seeking designs — with this qualification, that the whole energy of will and character is devoted to their attainment; that other interests (which would in themselves constitute attractive aims), or rather all things else, are sacrificed to them. The object in question is so bound up with the man's will, that it entirely and alone determines the "hue of resolution" and is inseparable from it. It has become the very essence of his volition. For a person is a specific existence; not man in general (a term to which no real existence corresponds), but a

particular human being. The term “character” likewise expresses this idiosyncrasy of Will and Intelligence. But *Character* comprehends all peculiarities whatever; the way in which a person conducts himself in private relations, &c., and is not limited to his idiosyncrasy in its practical and active phase. I shall, therefore, use the term “passion;” understanding thereby the particular bent of character, as far as the peculiarities of volition are not limited to private interest, but supply the impelling and actuating force for accomplishing deeds shared in by the community at large. Passion is in the first instance the *subjective*, and therefore the formal side of energy, will, and activity — leaving the object or aim still undetermined. And there is a similar relation of formality to reality in merely individual conviction, individual views, individual conscience. It is always a question, of essential importance, what is the purport of my conviction, what the object of my passion, in deciding whether the one or the other is of a true and substantial nature. Conversely, if it is so, it will inevitably attain actual existence — be realised.

§ 27

From this comment on the second essential element in the historical embodiment of an aim, we infer — glancing at the institution of the State in passing — that a State is then well constituted and internally powerful, when the private interest of its citizens is one with the common interest of the State; when the one finds its gratification and realisation in the other, — a proposition in itself very important. But in a State many institutions must be adopted, much political machinery invented, accompanied by appropriate political arrangements, — necessitating long struggles of the understanding before what is really appropriate can be discovered, — involving, moreover, contentions with private interest and passions, and a tedious discipline of these latter, in order to bring about the desired

harmony. The epoch when a State attains this harmonious condition, marks the period of its bloom, its virtue, its vigour, and its prosperity. But the history of mankind does not begin with *a conscious* aim of any kind, as it is the case with the particular circles into which men form themselves of set purpose. The mere social instinct implies a conscious purpose of security for life and property; and when society has been constituted, this purpose becomes more comprehensive. The History of the World begins with its general aim — the realisation of the Idea of Spirit — only in an *implicit* form (*an sich)* that is, as Nature; a hidden, most profoundly hidden, unconscious instinct; and the whole process of History (as already observed), is directed to rendering this unconscious impulse a conscious one. Thus appearing in the form of merely natural existence, natural will — that which has been called the subjective side, — physical craving, instinct, passion, private interest, as also opinion and subjective conception, — spontaneously present themselves at the very commencement. This vast congeries of volitions, interests and activities, constitute the instruments and means of the World-Spirit for attaining its object; bringing it to consciousness, and realising it. And this aim is none other than finding itself — coming to itself — and contemplating itself in concrete actuality. But that those manifestations of vitality on the part of individuals and peoples, in which they seek and satisfy their own purposes, are, at the same time, the means and instruments of a higher and broader purpose of which they know nothing, — which they realise unconsciously, - might be made a matter of question; rather has been questioned, and in every variety of form negatived, decried and contemned as mere dreaming and "Philosophy." But on this point I announced my view at the very outset, and asserted our hypothesis, — which, however, will appear in the sequel, in the form of a legitimate inference, — and our belief, that Reason governs the world, and has consequently governed its history. In relation to this independently

universal and substantial existence — all else is subordinate, subservient to it, and the means for its development. — The Union of Universal Abstract Existence generally with the Individual, - the Subjective — that this alone is Truth, belongs to the department of speculation, and is treated in this general form in Logic. — But in the process of the World's History itself, — as still incomplete, — the abstract final aim of history is not yet made the distinct object of desire and interest. While these limited sentiments are still unconscious of the purpose they are fulfilling, the universal principle is implicit in them, and is realising itself through them. The question also assumes the form of the union of *Freedom* and *Necessity*; the latent abstract process of Spirit being regarded as *Necessity*, while that which exhibits itself in the conscious will of men, as their interest, belongs to the domain of *Freedom.* As the metaphysical connection (i.e. the connection in the Idea) of these forms of thought, belongs to Logic, it would be out of place to analyse it here. The chief and cardinal points only shall be mentioned.

§ 28

Philosophy shows that the Idea advances to an infinite antithesis; that, viz. between the Idea in its free, universal form — in which it exists for itself — and the contrasted form of abstract introversion, reflection on itself, which is formal existence-for-self, personality, formal freedom, such as belongs to Spirit only. The universal Idea exists thus as the substantial totality of things on the one side, and as the abstract essence of free volition on the other side. This reflection of the mind on itself is individual self-consciousness — the polar opposite of the Idea in its general form, and therefore existing in absolute Limitation. This polar opposite is consequently limitation, particularisation, for the universal absolute being; it is the side of its *definite existence;* the sphere of its formal reality, the sphere of the reverence paid to God. — To comprehend the absolute connection of this antithesis, is the

profound task of metaphysics. This Limitation originates all forms of particularity of whatever kind. The formal volition [of which we have spoken] wills itself; desires to make its own personality valid in all that it purposes and does: even the pious individual wishes to be saved and happy. This pole of the antithesis, existing for itself, is — in contrast with the Absolute Universal Being — a special separate existence, taking cognisance of speciality only, and willing that alone. In short it plays its part in the region of mere phenomena. This is the sphere of particular purposes, in effecting which individuals exert themselves on behalf of their individuality — give it full play and objective realisation. This is also the sphere of happiness and its opposite. He is happy who finds his condition suited to his special character, will, and fancy, and so enjoys himself in that condition. The History of the World is not the theatre of happiness. Periods of happiness are blank pages in it, for they are periods of harmony, — periods when the antithesis is in abeyance. Reflection on self, — the Freedom above described — is abstractly defined as the formal element of the activity of the absolute Idea. The realising activity of which we have spoken is the middle term of the Syllogism, one of whose extremes is the Universal essence, the Idea, which reposes in the penetralia of Spirit; and the other, the complex of external things, objective matter. That activity is the medium by which the universal latent principle is translated into the domain of objectivity.

§ 29

I will endeavour to make what has been said more vivid and clear by examples.

The building of a house is, in the first instance, a subjective aim and design. On the other hand we have, as means, the several substances required for the work, — Iron, Wood, Stones. The elements are made use of

in working up this material: fire to melt the iron, wind to blow the fire, water to set wheels in motion, in order to cut the wood, &c. The result is, that the wind, which has helped to build the house, is shut out by the house; so also are the violence of rains and floods, and the destructive powers of fire, so far as the house is made fire-proof. The stones and beams obey the law of gravity, — press downwards, — and so high walls are carried up. Thus the elements are made use of in accordance with their nature, and yet to co-operate for a product, by which their operation is limited. Thus the passions of men are gratified; they develop themselves and their aims in accordance with their natural tendencies, and build up the edifice of human society; thus fortifying a position for Right and Order *against themselves.*

§ 30

The connection of events above indicated, involves also the fact, that in history an additional result is commonly produced by human actions beyond that which they aim at and obtain — that which they immediately recognise and desire. They gratify their own interest; but something farther is thereby accomplished, latent in the actions in question, though not present to their consciousness, and not included in their design. An analogous example is offered in the case of a man who, from a feeling of revenge, — perhaps not an unjust one, but produced by injury on the other's part, — burns that other man's house. A connection is immediately established between the deed itself and a train of circumstances not directly included in it, taken abstractedly. In itself it consisted in merely presenting a small flame to a small portion of a beam. Events not involved in that simple act follow of themselves. The part of the beam which was set fire to is connected with its remote portions; the beam itself is united with the woodwork of the house generally, and this with other houses; so that a wide conflagration ensues, which destroys the goods and chattels of many other

persons besides his against whom the act of revenge was first directed; perhaps even costs not a few men their lives. This lay neither in the deed abstractedly, nor in the design of the man who committed it. But the action has a further general bearing. In the design of the doer it was only revenge executed against an individual in the destruction of his property, but it is moreover a crime, and that involves punishment also. This may not have been present to the mind of the perpetrator, still less in his intention; but his deed itself, the general principles it calls into play, its substantial content entails it. By this example I wish only to impress on you the consideration, that in a simple act, something farther may be implicated than lies in the intention and consciousness of the agent. The example before us involves, however, this additional consideration, that the substance of the act, consequently we may say the act itself, recoils upon the perpetrator, — reacts upon him with destructive tendency. This union of the two extremes — the embodiment of a general idea in the form of direct reality, and the elevation of a speciality into connection with universal truth — is brought to pass, at first sight, under the conditions of an utter diversity of nature between the two, and an indifference of the one extreme towards the other. The aims which the agent set before them are limited and special; but it must be remarked that the agents themselves are intelligent thinking beings. The purport of their desires is interwoven with *general, essential* considerations of justice, good, duty, &c; for mere desire — volition in its rough and savage forms — falls not within the scene and sphere of Universal History. Those general considerations, which form at the same time a norm for directing aims and actions, have determinate purport; for such an abstraction as "good for its own sake," has no place in living reality. If men are to act, they must not only intend the Good, but must have decided for themselves whether this or that particular thing is a Good. What special course of action, however, is good or not, is determined, as regards

the ordinary contingencies of private life, by the laws and customs of a State; and here no great difficulty is presented. Each individual has his position; he knows on the whole what a just, honourable course of conduct is. As to ordinary, private relations, the assertion that it is difficult to choose the right and good, — the regarding it as the mark of an exalted morality to find difficulties and raise scruples on that score — may be set down to an evil or perverse will, which seeks to evade duties not in themselves of a perplexing nature; or, at any rate, to an idly reflective habit of mind — where a feeble will affords no sufficient exercise to the faculties, — leaving them therefore to find occupation within themselves, and to expend themselves on moral self-adulation.

§ 31

It is quite otherwise with the comprehensive relations that History has to do with. In this sphere are presented those momentous collisions between existing, acknowledged duties, laws, and rights, and those contingencies which are adverse to this fixed system; — which assail and even destroy its foundations and existence; whose tenor may nevertheless seem good, — on the large scale advantageous, — yes, even indispensable and necessary. These contingencies realise themselves in History: they involve a general principle of a different order from that on which depends the *permanence* of a people or a State. This principle is an essential phase in the development of the *creating* Idea, of Truth striving and urging towards [consciousness of] itself. Historical men — *World-Historical Individuals* — are those in whose aims such a general principle lies.

§ 32

Caesar, in danger of losing a position, not perhaps at that time of superiority, yet at least of equality with the others who were at the head of

the State, and of succumbing to those who were just on the point of becoming his enemies, — belongs essentially to this category. These enemies — who were at the same time pursuing *their* personal aims — had the form of the constitution, and the power conferred by an appearance of justice, on their side. Caesar was contending for the maintenance of his position, honour, and safety; and, since the power of his opponents included the sovereignty over the provinces of the Roman Empire, his victory secured for him the conquest of that entire Empire: and he thus became — though leaving the form of the constitution — the Autocrat of the State. That which secured for him the execution of a design, which in the first instance was of negative import — the Autocracy of Rome, — was, however, at the same time an independently necessary feature in the history of Rome and of the world. It was not, then, his private gain merely, but an unconscious impulse that occasioned the accomplishment of that for which the time was ripe. Such are all great historical men — whose own particular aims involve those large issues which are the will of the World-Spirit. They may be called Heroes, inasmuch as they have derived their purposes and their vocation, not from the calm, regular course of things, sanctioned by the existing order; but from a concealed fount — one which has not attained to phenomenal, present existence, — from that inner Spirit, still hidden beneath the surface, which, impinging on the outer world as on a shell, bursts it in pieces, because it is another kernel than that which belonged to the shell in question. They are men, therefore, who appear to draw the impulse of their life from themselves; and whose deeds have produced a condition of things and a complex of historical relations which appear to be only *their* interest, and *their* work.

§ 33

Such individuals had no consciousness of the general Idea they were unfolding, while prosecuting those aims of theirs; on the contrary, they were practical, political men. But at the same time they were thinking men, who had an insight into the requirements of the time — what *was ripe for development.* This was the very Truth for their age, for their world; the species next in order, so to speak, and which was already formed in the womb of time. It was theirs to know this nascent principle; the necessary, directly sequent step in progress, which their world was to take; to make this their aim, and to expend their energy in promoting it. World-historical men — the Heroes of an epoch — must, therefore, be recognised as it's clear-sighted ones; *their* deeds, *their* words are the best of that time. Great men have formed purposes to satisfy themselves, not others. Whatever prudent designs and counsels they might have learned from others, would be the more limited and inconsistent features in their career; for it was they who best understood affairs; from whom *others* learned, and approved, or at least acquiesced in their policy. For that Spirit which had taken this fresh step in history is the inmost soul of all individuals; but in a state of unconsciousness which the great men in question aroused. Their fellows, therefore, follow these soul-leaders; for they feel the irresistible power of their own inner Spirit thus embodied. If we go on to cast a look at the fate of these World-Historical persons, whose vocation it was to be the agents of the World-Spirit, — we shall find it to have been no happy one. They attained no calm enjoyment; their whole life was labour and trouble; their whole nature was nought else but their master-passion. When their object is attained they fall off like empty hulls from the kernel. They die early, like Alexander; they are murdered, like Caesar; transported to St. Helena., like Napoleon. This fearful consolation — that historical men have not enjoyed what is called happiness, and of which only private life (and this may be passed under very various external circumstances) is capable, — this

consolation those may draw from history, who stand in need of it; and it is craved by Envy — vexed at what is great and transcendent, — striving, therefore, to depreciate it, and to find some flaw in it. Thus in modern times it has been demonstrated ad nauseam that princes are generally unhappy on their thrones; in consideration of which the possession of a throne is tolerated, and men acquiesce in the fact that not themselves but the personages in question are its occupants. The Free Man, we may observe, is not envious, but gladly recognises what is great and exalted, and rejoices that it exists.

§ 34

It is in the light of those common elements which constitute the interest and therefore the passions of individuals, that these historical men are to be regarded. They are *great* men, because they willed and accomplished something great; not a mere fancy, a mere intention, but that which met the case and fell in with the needs of the age. This mode of considering them also excludes the so-called "psychological" view, which — serving the purpose of envy most effectually - contrives so to refer all actions to the heart, — to bring them under such a subjective aspect — as that their authors appear to have done everything under the impulse of some passion, mean or grand, — some morbid craving, — and on account of these passions and cravings to have been not moral men. Alexander of Macedon partly subdued Greece, and then Asia; therefore he was possessed by a morbid *craving* for conquest. He is alleged to have acted from a craving for fame, for conquest; and the proof that these were the impelling motives is that he did that which resulted in fame. What pedagogue has not demonstrated of Alexander the Great — of Julius Caesar — that they were instigated by such passions, and were consequently immoral men, — whence the conclusion immediately follows that he, the pedagogue, is a

better man than they, because he has not such passions; a proof of which lies in the fact that he does not conquer Asia, — vanquish Darius and Porus, — but while he enjoys life himself lets others enjoy it too. These psychologists are particularly fond of contemplating those peculiarities of great historical figures which appertain to them as private persons. Man must eat and drink; he sustains relations to friends and acquaintances; he has passing impulses and ebullitions of temper. “No man is a hero to his valet-de-chambre,” is a well-known proverb; I have added — and Goethe repeated it ten years later— “but not because the former is no hero, but because the latter is a valet.” He takes off the hero’s boots, assists him to bed, knows that he prefers champagne, &c. Historical personages waited upon in historical literature by such psychological valets, come poorly off; they are brought down by these their attendants to a level with — or rather a few degrees below the level of — the morality of such exquisite discerners of spirits. The Thersites of Homer who abuses the kings is a standing figure for all times. Blows — that is beating with a solid cudgel — he does not get in every age as in the Homeric one; but his envy, his egotism, is the thorn which he has to carry in his flesh; and the undying worm that gnaws him is the tormenting consideration that his excellent views and vituperations remain absolutely without result in the world. But our satisfaction at the fate of Thersitism also, may have its sinister side.

§ 35

A World-historical individual is not so unwise as to indulge a variety of wishes to divide his regards. He is devoted to the One Aim, regardless of all else. It is even possible that such men may treat other great, even sacred interests, inconsiderately; conduct which is indeed obnoxious to moral reprehension. But so mighty a form must trample down many an innocent flower-crush to pieces many an object in its path.

§ 36

The special interest of passion is thus inseparable from the active development of a general principle: for it is from the special and determinate and from its negation, that the Universal results. Particularity contends with its like, and some loss is involved in the issue. It is not the general idea that is implicated in opposition and combat, and that is exposed to danger. It remains in the background, untouched and uninjured. This may be called the *cunning of reason*, — that it sets the passions to work for itself, while that which develops its existence through such impulsion pays the penalty and suffers loss. For it is *phenomenal* being that is so treated, and of this, part is of no value, part is positive and real. The particular is for the most part of too trifling value as compared with the general: individuals are sacrificed and abandoned. The Idea pays the penalty of determinate existence and of corruptibility, not from itself, but from the passions of individuals.

§ 37

But though we might tolerate the idea that individuals, their desires and the gratification of them, are thus sacrificed, and their happiness given up to the empire of chance, to which it belongs; and that as a general rule, individuals come under the category of means to an ulterior end, — there is one aspect of human individuality which we should hesitate to regard in that subordinate light, even in relation to the highest; since it is absolutely no subordinate element, but exists in those individuals as inherently eternal and divine. I mean *morality, ethics, religion.* Even when speaking of the realisation of the great ideal aim by means of individuals, the *subjective* element in them — their interest and that of their cravings and impulses, their views and judgments, though exhibited as the merely formal side of

their existence, — was spoken of as having an infinite right to be consulted. The first idea that presents itself in speaking of *means* is that of something external to the object, and having no share in the object itself. But merely natural things — even the commonest lifeless objects — used as means, must be of such a kind as adapts them to their purpose; they must possess something in common with it. Human beings least of all, sustain the bare external relation of mere means to the great ideal aim. Not only do they in the very act of realising it, make it the occasion of satisfying personal desires, whose purport is diverse from that aim — but they share in that ideal aim itself; and are for that very reason objects of their own existence; not *formally* merely, as the world of living beings generally is — whose individual life is essentially subordinate to that of man, and is properly used *up* as an instrument. Men, on the contrary, are objects of existence to themselves, as regards the intrinsic import of the aim in question. To this order belongs that in them which we would exclude from the category of mere means, - Morality, Ethics, Religion. That is to say, man is an object of existence in himself only in virtue of the Divine that is in him, — that which was designated at the outset as *Reason;* which, in view of its activity and power of self-determination, was called *Freedom.* And we affirm — without entering at present on the proof of the assertion -that Religion, Morality, &c. have their foundation and source in that principle, and so are essentially elevated above all alien necessity and chance. And here we must remark that individuals, to the extent of their freedom, are responsible for the depravation and enfeeblement of morals and religion. This is the seal of the absolute and sublime destiny of man — that be knows what is good and what is evil; that his destiny *is* his very ability to will either good or evil, — in one word, that he is the subject of moral imputation, imputation not only of evil, but of good; and not only concerning this or that particular matters and all that happens *ab extrâ*, but *also* the good and evil attaching to his

individual freedom. The brute alone is simply innocent. It would, however demand an extensive explanation — as extensive as the analysis of moral freedom itself — to preclude or obviate all the misunderstandings which the statement that what is called innocent imports the entire unconsciousness of evil — is wont to occasion.

§ 38

In contemplating the fate which virtue, morality, even piety experience in history, we must not fall into the Litany of Lamentations, that the good and pious often — or for the most part — fare ill in the world, while the evil-disposed and wicked prosper. The term *prosperity* is used in a variety of meanings — riches, outward honour, and the like. But in speaking of something which in and for itself constitutes an aim of existence, that so-called well or ill-faring of these or those isolated individuals cannot be regarded as an essential element in the rational order of the universe. With more justice than happiness — or a fortunate environment for individuals, — it is demanded of the grand aim of the world's existence, that it should foster, nay involve the execution and ratification of good, moral, righteous purposes. What makes men morally discontented (a discontent, by the bye, on which they somewhat pride themselves), is that they do not find the present adapted to the realisation of aims which they hold to be right and just (more especially in modern times, ideals of political constitutions); they contrast unfavourably things as they are, with their idea of things as they *ought* to be. In this case it is not private interest nor passion that desires gratification, but Reason, Justice, Liberty; and equipped with this title, the demand in question assumes a lofty bearing, and readily adopts a position not merely of discontent, but of open revolt against the actual condition of the world. To estimate such a feeling and such views aright, the demands insisted upon, and the very dogmatic opinions asserted, must be examined.

At no time so much as in our own, have such general principles and notions been advanced, or with greater assurance. If in days gone by, history seems to present itself as a struggle of passions; in our time — though displays of passion are not wanting — it exhibits partly a predominance of the struggle of notions assuming the authority of principles; partly that of passions and interests essentially subjective, but under the mask of such higher sanctions. The pretensions thus contended for as legitimate in the name of that which has been stated as the ultimate aim of Reason, pass accordingly, for absolute aims, — to the same extent as Religion, Morals, Ethics. Nothing, as before remarked, is now more common than the complaint that the *ideals* which imagination sets up are not realised — that these glorious dreams are destroyed by cold actuality. These Ideals — which in the voyage of life founder on the rocks of hard reality — may be in the first instance only subjective, and belong to the idiosyncrasy of the individual, imagining himself the highest and wisest. Such do not properly belong to this category. For the fancies which the individual in his isolation indulges, cannot be the model for universal reality; just as *universal* law is not designed for the units of the mass. These as such may, in fact, find their interests decidedly thrust into the background. But by the term "Ideal," we also understand the ideal of Reason, of the Good, of the True. Poets, as *e.g.* Schiller, have painted such ideals touchingly and with strong emotion, and with the deeply melancholy conviction that they could not be realised. In affirming, on the contrary that the Universal Reason *does* realise itself, we leave indeed nothing to do with the individual empirically regarded. That admits of degrees of better and worse, since here chance and speciality have received authority from the Idea to exercise their monstrous power. Much, therefore, in particular aspects of the grand phenomenon might be found fault with. This subjective fault-finding, — which, however, only keeps in view the individual and its deficiency, without taking notice of Reason pervading the

whole, — is easy; and inasmuch as it asserts an excellent intention with regard to the good of the whole, and seems to result from a kindly heart, it feels authorised to give itself airs and assume great consequence. It is easier to discover a deficiency in individuals, in states, and in Providence, than to see their real import and value. For in this merely negative fault-finding a proud position is taken, — one which overlooks the object, without having entered into it, — without having comprehended its positive aspect. Age generally makes men more tolerant; youth is always discontented. The tolerance of age is the result of the ripeness of a judgment which, - not merely as the result of indifference, is satisfied even with what is inferior; but, more deeply taught by the grave experience of life, has been led to perceive the substantial, solid worth of the object in question. The insight then to which — in contradistinction from those ideals — philosophy is to lead us, is, that the real world is as it ought to be — that the truly good — the universal divine reason — is not a mere abstraction, but a vital principle capable of realising itself. This *Good,* this *Reason*, in its most concrete form, is God. God governs the world; the actual working of his government — the carrying out of his plan — is the History of the World. This plan philosophy strives to comprehend; for only that which has been developed as the result of it, possesses bona fide reality. That which does not accord with it, is negative, worthless existence. Before the pure light of this divine Idea — which is no mere Idea - the phantom of a world whose events are an incoherent concourse of fortuitous circumstances, utterly vanishes. Philosophy wishes to discover the substantial purport, the real side of the divine idea and to justify the so much despised Reality of things; for Reason is the comprehension of the Divine work. But as to what concerns the perversion, corruption, and ruin of religious, ethical and moral purposes, and states of society generally, it must be affirmed, that in their *essence* these are infinite and eternal; but that the forms they assume may be of a

limited orders and consequently belong to the domain of mere nature, and be subject to the sway of chance. They are therefore perishable, and exposed to decay and corruption. Religion and morality — in the same way as inherently universal essences — have the peculiarity of being present in the individual soul, in the full extent of their Idea, and therefore truly and really; although they may not manifest themselves in it *in extenso*, and are not applied to fully developed relations. The religion, the morality of a limited sphere of life — that of a shepherd or a peasant, e.g. — in its intensive concentration and limitation to a few perfectly simple relations of life, — has infinite worth; the same worth as the religion and morality of extensive knowledge, and of an existence rich in the compass of its relations and actions. This inner focus — this simple region of the claims of subjective freedom, — the home of volition, resolution, and action, — the abstract sphere of conscience, — that which comprises the responsibility and moral value of the individual, remains untouched; and is quite shut out from the noisy din of the World's History — including not merely external and temporal changes, but also those entailed by the absolute necessity inseparable from the realisation of the Idea of Freedom itself. But as a general truth this must be regarded as settled, that whatever in the world possesses claims as noble and glorious, has nevertheless a higher existence above it. The claim of the World-Spirit rises above all special claims.

§ 39

These observations may suffice in reference to the means which the World-Spirit uses for realising its Idea. Stated simply and abstractly, this mediation involves the activity of personal existences in whom Reason is present as their absolute substantial being; but a basis, in the first instance, still obscure and unknown to them. But the subject becomes more complicated and difficult when we regard individuals not merely in their aspect of

activity, but more concretely, in conjunction with a particular manifestation of that activity in their religion and morality, — forms of existence which are intimately connected with Reason, and share in its absolute claims. Here the relation of mere means of an end disappears, and the chief hearings of this seeming difficulty in reference to the absolute aim of Spirit, have been briefly considered.

III. PHILOSOPHIC HISTORY, II. THE ESSENTIAL DESTINY OF REASON

(3) THE EMBODIMENT SPIRIT ASSUMES – THE STATE

§ 40

THE THIRD POINT to be analysed is, therefore – what is the object to be realised by these means; i.e. what is the form it assumes in the realm of reality. We have spoken of means; but in the carrying out of a subjective, limited aim, we have also to take into consideration the element of a *material*, either already present or which has to be procured. Thus the question would arise: What is the material in which the Ideal of Reason is wrought out? The primary answer would be, – Personality itself – human desires – Subjectivity generally. In human knowledge and volition, as its material element, Reason attains positive existence. We have considered subjective volition where it has an object which is the truth and essence of a reality, viz. where it constitutes a great world-historical passion. As a subjective will, occupied with limited passions, it is dependent, and can gratify its desires only within the limits of this dependence. But the subjective will has also a substantial life – a reality, – in which it moves in the region of *essential* being and has the essential itself as the object of its existence. This essential being is the union of the *subjective* with the *rational* Will: it is the moral Whole, the State, which is that form of reality in which the individual has and enjoys his freedom; but on the condition of his recognition, believing in and willing that which is common to the Whole. And this must not be understood as if the subjective will of the social unit attained its gratification and enjoyment through that common Will; as if this were a means provided for its benefit; as if the individual, in his relations to other individuals, thus limited his freedom, in order that this

universal limitation – the mutual constraint of all – might secure a small space of liberty for each. Rather, we affirm, are Law, Morality, Government, and they alone, the positive reality and completion of Freedom. Freedom of a low and limited order, is mere caprice; which finds its exercise in the sphere of particular and limited desires.

§ 41

Subjective volition – Passion – is that which sets men in activity, that which effects “practical” realisation. The Idea is the inner spring of action; the State is the actually, existing, realised moral life. For it is the Unity of the universal, essential Will, with that of the individual; and this is “Morality.” The Individual living in this unity has a moral life; possesses a value that consists in this substantiality alone. Sophocles in his Antigone, says, “The divine commands are not of yesterday, nor of today; no, they have an infinite existence, and no one could say whence they came.” The laws of morality are not accidental, but are the essentially Rational. It is the very object of the State that what is essential in the practical activity of men, and in their dispositions, should be duly recognised; that it should have a manifest existence, and maintain its position. It is the absolute interest of Reason that this moral Whole should exist; and herein lies the justification and merit of heroes who have founded states, – however rude these may have been. In the history of the World., only those peoples can come under our notice which form a state. For it must be understood that this latter is the realisation of Freedom, i.e. of the absolute final aim, and that it exists for its own sake. It must further be understood that all the worth which the human being possesses – all spiritual reality, he possesses only through the State. For his spiritual reality consists in this, that his own essence – Reason – is objectively present to him, that it possesses objective immediate existence for him. Thus only is he fully conscious; thus only is he a partaker

of morality – of a just and moral social and political life. For Truth is the Unity of the universal and subjective Will; and the Universal is to be found in the State, in its laws, its universal and rational arrangements. The State is the Divine Idea as it exists on Earth. We have in it, therefore, the object of History in a more definite shape than before; that in which Freedom obtains objectivity, and lives in the enjoyment of this objectivity. For Law is the objectivity of Spirit; volition in its true form. Only that will which obeys law, is free; for it obeys itself – it is independent and so free. When the State or our country constitutes a community of existence; when the subjective will of man submits to laws, – the contradiction between Liberty and Necessity vanishes. The Rational has necessary existence as being the reality and substance of things, and we are free in recognising it as law, and following it as the substance of our own being. The objective and the subjective will are then reconciled, and present one identical homogeneous whole. For the morality (*Sittlichkeit*) of the State is not of that ethical (*moralische*) reflective kind, in which one's own conviction bears sway; this latter is rather the peculiarity of the modern time, while the true antique morality is based on the principle of abiding by one's duty [to the state at large]. An Athenian citizen did what was required of him, as it were from instinct; but if I reflect on the object of nay activity, I must have the consciousness that my will has been called into exercise. But morality is Duty – substantial Right – a "*second* nature" as it has been justly called; for the *first* nature of man is his primary merely animal existence.

§ 42

The development *in extenso* of the Idea of the State belongs to the Philosophy of Right; but it must be observed that in the theories of our time various errors are current respecting it, which pass for established truths, and have become fixed prejudices. We will mention only a few of them,

giving prominence to such as have a reference to the object of our history. The error which first meets us is the direct contradictory of our principle that the state presents the realisation of Freedom; the opinion, viz., that man is free by *nature*, but that in *society*, in the State – to which nevertheless he is irresistibly impelled – he must limit this natural freedom. That man is free by Nature is quite correct in one sense; viz., that he is so according to the Idea of Humanity; but we imply thereby that he is such only in virtue of his destiny – that he has an undeveloped power to become such; for the "Nature" of an object is exactly synonymous with its "Idea." But the view in question imports more than this. When man is spoken of as "free by Nature," the mode of his existence as well as his destiny is implied. His merely natural and primary condition is intended. In this sense a "state of Nature" is assumed in which mankind at large are in the possession of their natural rights with the unconstrained exercise and enjoyment of their freedom. This assumption is not indeed raised to the dignity of the historical fact; it would indeed be difficult, were the attempt seriously made, to point out any such condition as actually existing, or as having ever occurred. Examples of a savage state of life can be pointed out, but they are marked by brutal passions and deeds of violence; while, however rude and simple their conditions, they involve social arrangements which (to use the common phrase) *restrain* freedom. That assumption is one of those nebulous images which theory produces; an idea which it cannot avoid originating, but which it fathers upon real existence, without sufficient historical justification.

§ 43

What we find such a state of Nature to be in actual experience, answers exactly to the Idea of a *merely* natural condition. Freedom as the *ideal* of that which is original and natural, does not exist *as original and natural*.

Rather must it be first sought out and won; and that by an incalculable medial discipline of the intellectual and moral powers. The state of Nature is, therefore, predominantly that of injustice and violence, of untamed natural impulses, of inhuman deeds and feelings. Limitation is certainty produced by Society and the State, but it is a limitation of the mere brute emotions and rude instincts; as also, in a more advanced stage of culture, of the premeditated self-will of caprice and passion. This kind of constraint is part of the instrumentality by which only, the consciousness of Freedom and the desire for its attainment, in its true – that is Rational and Ideal form – can be obtained. To the Ideal of Freedom, Law and Morality are indispensably requisite: and they are in and for themselves, universal existences, objects and aims; which are discovered only by the activity of thought, separating itself from the merely sensuous, and developing itself, in opposition thereto; and which must on the other hand, be introduced into and incorporated with the originally sensuous will, and that contrarily to its natural inclination. The perpetually recurring misapprehension of Freedom consists in regarding that term only in its *formal*, subjective sense, abstracted from its essential objects and aims; thus a constraint put upon impulse, desire, passion – pertaining to the particular individual as such – a limitation of caprice and self-will is regarded as a fettering of Freedom. We should on the contrary look upon such limitation as the indispensable proviso of emancipation. Society and the State are the very conditions in which Freedom is realised.

§ 44

We must notice a second view, contravening the principle of the development of moral relations into a legal form. The *patriarchal* condition is regarded – either in reference to the entire race of man, or to some branches of it – as exclusively that condition of things, in which the legal

element is combined with a due recognition of the moral and emotional parts of our nature; and in which justice as united with these, truly and really influences the intercourse of the social units. The basis of the patriarchal condition is the family relation; which develops the primary form of conscious morality, succeeded by that of the State as its *second* phase. The patriarchal condition is one of transition, in which the family has already advanced to the position of a race or people; where the union, therefore, has already ceased to be simply a bond of love and confidence, and has become one of plighted service. We must first examine the ethical principle of the Family. The Family may be reckoned as virtually a single person; since its members have either mutually surrendered their individual personality, (and consequently their legal position towards each other, with the rest of their particular interests and desires) as in the case of the Parents; or have not yet attained such an independent personality, – (the Children, – who are primarily in that merely natural condition already mentioned.) They live, therefore, in a unity of feeling, love, confidence, and faith in each other. And in a relation of mutual love, the one individual has the consciousness of himself in the consciousness of the other; he lives out of self; and in this mutual self-renunciation each regains the life that had been virtually transferred to the other; gains, in fact, that other's existence and his own, as involved with that other. The farther interests connected with the necessities and external concerns of life, as well as the development that has to take place within their circle, *i.e.* of the children constitute a common object for the members of the Family. The Spirit of the Family – the Penates – form one substantial being, as much as the Spirit of a People in the State; and morality in both cases consists in a feeling, a consciousness, and a will, not limited to individual personality and interest, but embracing the common interests of the members generally. But this unity is in the case of the Family essentially one of *feeling;* not advancing beyond the limits of the

merely *natural*. The piety of the Family relation should be respected in the highest degree by the State; by its means the State obtains as its members individuals who are already moral (for as mere *persons* they are not) and who in uniting to form a state bring with them that sound basis of a political edifice – the capacity of feeling one with a Whole. But the expansion of the Family to a patriarchal unity carries us beyond the ties of blood-relationship – the simply natural elements of that basis; and outside of these limits the members of the community must enter upon the position of independent personality. A review of the patriarchal condition, *in extenso*, would lead us to give special attention to the Theocratical Constitution. The head of the patriarchal clan is also its priest. If the Family in its general relations, is not yet separated from civic society and the state, the separation of religion from it has also not yet taken place; and so much the less since the piety of the hearth is itself a profoundly subjective state of feeling.

§ 45

We have considered two aspects of Freedom, – the objective and the subjective; if, therefore, Freedom is asserted to consist in the individuals of a State all agreeing in its arrangements it is evident that only the subjective aspect is regarded. The natural inference from this principle is, that no law can be valid without the approval of all. This difficulty is attempted to be obviated by the decision that the minority must yield to the. majority; the majority therefore bear the sway. But long ago J. J. Rousseau remarked, that in that case there would be no longer freedom, for the will of the *minority* would cease to be respected. At the Polish Diet each single member had to give his consent before any political step could be taken; and this kind of freedom it was that ruined the State. Besides, it is a dangerous and false prejudice, that the People *alone* have reason and insight, and know what justice is; for each popular faction may represent itself as the People, and

the question as to what constitutes the State is one of advanced science, and not of popular decision.

§ 46

If the principle of regard for the individual will is recognised as the only basis of political liberty, viz., that nothing should be done by or for the State to which all the members of the body politic have not given their sanction, we have, properly speaking, no *Constitution.* The only arrangement that would be necessary, would be, first, a centre having no *will* of its own but which should take into consideration what appeared to be the necessities of the State; and, secondly, a contrivance for calling the members of the State together, for taking the votes, and for performing the arithmetical operations of reckoning and comparing the number of votes for the different propositions, and thereby deciding upon them. The State is an *abstraction*, having even its generic existence in its citizens; but it is an actuality, and its simply generic existence must embody itself in individual will and activity. The want of government and political administration in general is felt; this necessitates the selection and separation from the rest of those who have to take the helm in political affairs, to decide, concerning them, and to give orders to other citizens, with a view to the execution of their plans. If, *e.g.*, even the people in a Democracy resolve on a war, a general must head the army. It is only by a Constitution that the *abstraction* – the State – attains life and reality; but this involves the distinction between those who command and those who obey. – Yet obedience seems inconsistent with liberty, and those who command appear to do the very opposite of that which the fundamental idea of the State, viz. that of Freedom, requires. It is, however, urged that, – though the distinction between commanding and obeying is absolutely necessary, because affairs could not go on without it – and indeed this seems only a compulsory limitation, external to and even

contravening freedom in the abstract – the constitution should be at least so framed, that the citizens may obey as little as possible, and the smallest modicum of free volition be left to the commands of the superiors; – that the substance of that for which subordination is necessary, even in its most important bearings, should be decided and resolved on by the People – by the will of many or of all the citizens; though it is supposed to be thereby provided that the State should be possessed of vigour and strength as a reality – an individual unity. – The primary consideration is, then, the distinction between the governing and the governed, and political constitutions in the abstract have been rightly divided into Monarchy, Aristocracy, and Democracy; which gives occasion, however, to the remark that Monarchy itself must be further divided into Despotism and Monarchy proper; that in all the divisions to which the leading Idea gives rise, only the generic character is to be made prominent, – it being not intended thereby that the particular category under review should be exhausted as a Form, Order, or Kind in its *concrete* development. But especially it must be observed, that the above-mentioned divisions admit of a multitude of particular modifications, – not only such as lie within the limits of those classes themselves, – but also such as are mixtures of several of these essentially distinct classes, and which are consequently misshapen, unstable, and inconsistent forms. In such a collision, the concerning question is, what is the *best constitution;* that is, by what arrangement, organisation or mechanism of the power of the State its object can be most surely attained. This object may indeed be variously understood; for instance, as the calm enjoyment of life on the part of the citizens, or as Universal Happiness. Such aims have suggested the so-called Ideals of Constitution, and, – as a particular branch of the subject, – Ideals of the Education of Princes (Fenelon), or of the governing body – the aristocracy at large (Plato); for the chief point they treat of is the condition of those

subjects who stand at the head of affairs; and in these ideals the concrete details of political organisation are not at all considered. The inquiry into the best constitution is frequently treated as if not only the theory were an affair of subjective independent conviction, but as if the introduction of a constitution recognised as the best, – or as superior to others, – could be the result of a resolve adopted in this theoretical manner; as if the form of a constitution were a matter of free choice, determined by nothing else but reflection. Of this artless fashion was that deliberation, – not indeed of the Persian *people*, but of the Persian *grandees*, who had conspired to overthrow the pseudo-Smerdis and the Magi, after their undertaking had succeeded, and when there was no scion of the royal family living, – as to what constitution they should introduce into Persia; and Herodotus gives an equally naive account of this deliberation.

§ 47

In the present day, the Constitution of a country and people is not represented as so entirely dependent on free and deliberate choice. The fundamental but abstractly (and therefore imperfectly) entertained conception of Freedom, has resulted in the Republic being very generally regarded – in theory – as the only just and true political constitution. Many even, who occupy elevated official positions under monarchical constitutions – so far from being opposed to this idea – are actually its supporters; only they see that such a constitution, though the best, cannot be realised under all circumstances; and that – while men are what they are – we must be satisfied with less freedom; the monarchical constitution – under the given circumstances, and the present moral condition of the people – being even regarded as the most advantageous. In this view also, the necessity of a particular constitution is made to depend on the condition of the people in such a way as if the latter were non-essential and

accidental. This representation is founded on the distinction which the reflective understanding makes between an idea and the corresponding reality; holding to an abstract and consequently untrue idea; not grasping it in its completeness, or – which is virtually, though not in point of form, the same – not taking a concrete view of a people and a state. We shall have to show further on that the constitution adopted by a people makes one substance – one spirit – with its religion, its art and philosophy, or, at least, with its conceptions and thoughts – its culture generally; not to expatiate upon the additional influences, *ab extrâ*, of climate, of neighbours, of its place in the world. A State is an individual totality, of which you cannot select any particular side, although a supremely important one, such as its political constitution; and deliberate and decide respecting it in that isolated form. Not only is that constitution most intimately connected with and dependent on those other spiritual forces; but the form of the entire moral and intellectual individuality – comprising all the forces it embodies – is only a step in the development of the grand Whole, – with its place pre-appointed in the process: a fact which gives the highest sanction to the constitution in question, and establishes its absolute necessity. -The origin of a State involves imperious lordship on the one hand, instinctive submission on the other. But even obedience – lordly power, and the fear inspired by a ruler – in itself implies some degree of voluntary connection. Even in barbarous states this is the case; it is not the isolated will of individuals that prevails; individual pretensions are relinquished, and the general will is the essential bond of political union. This unity of the general and the particular is the Idea itself, manifesting itself as a *State*, and which subsequently undergoes further development within itself. The abstract yet necessitated process in the development of truly independent states is as follows: – They begin with regal power, whether of patriarchal or military origin. In the next phase, particularity and individuality assert themselves in

the form of Aristocracy and Democracy. Lastly, we have the subjection of these separate interests to a single power; but which can be absolutely none other than one outside of which those spheres have an independent position, viz., the Monarchical. Two phases of royalty, therefore, must be distinguished, – a primary and a secondary one. This process is necessitated, so that the form of government assigned to a particular stage of development *must* present itself: it is therefore no matter of choice, but is that form which is adapted to the spirit of the people.

§ 48

In a Constitution the main feature of interest is the self-development of the *rational*, that is, the *political* condition of a people; the setting free of the successive elements of the Idea: so that the several powers in the State manifest themselves as separate, – attain their appropriate and special perfection, – and yet in this independent condition, work together for one object, and are held together by it – i.e., form an organic whole. The State is thus the embodiment of rational freedom, realising and recognising itself in an objective form. For its objectivity consists in this, – that its successive stages are not merely ideal, but are present in an appropriate reality; and that in their separate and several working, they are absolutely merged in that agency by which the totality – the soul – the individual unity – is produced, and of which it is the result.

§ 49

The State is the Idea of Spirit in the external manifestation of human Will and its Freedom. It is to the State, therefore, that change in the aspect of History indissolubly attaches itself; and the successive phases of the Idea manifest themselves in it as distinct political *principles.* The Constitutions under which World-Historical peoples have reached their culmination, are

peculiar to them; and therefore do not present a generally applicable political basis. Were it otherwise, the differences of similar constitutions would consist only in a peculiar method of expanding and developing that generic basis; whereas they really originate in diversity of principle. From the comparison therefore of the political institutions of the ancient World-Historical peoples, it so happens, that for the most recent principle of a Constitution – for the principle of our own times – nothing (so to speak) can be learned. In science and art it is quite otherwise; e. g., the ancient philosophy is so decidedly the basis of the modern, that it is inevitably contained in the latter, and constitutes its basis. In this case the relation is that of a continuous development of the same structure, whose foundation-stone, walls, and roof have remained what they were. In Art, the Greek itself, in its original form, furnishes us the best models. But in regard to political constitution, it is quite otherwise: here the Ancient and the Modern have not their essential principle in common. Abstract definitions and dogmas respecting just government, – importing that intelligence and virtue ought to bear sway – are, indeed, common to both. But nothing is so absurd as to look to Greeks, Romans, or Orientals, for models for the political arrangements of our time. From the East may be derived beautiful pictures of a patriarchal condition, of paternal government, and of devotion to it on the part of peoples; from Greeks and Romans, descriptions of popular liberty. Among the latter we find the idea of a Free Constitution admitting all the citizens to a share in deliberations and resolves respecting the affairs and laws of the Commonwealth. In our times, too, this is its general acceptation; only with this modification, that – since our States are so large, and there are so many of “the Many,” the latter, – direct action being impossible, – should by the indirect method of elective substitution express their concurrence with resolves affecting the common weal; that is, that for legislative purposes generally, the people should be represented by deputies.

The so-called Representative Constitution is that form of government with which we connect the idea of a free constitution, and this notion has become a rooted prejudice. On this theory People and Government are separated. But there is a perversity in this antithesis; an ill-intentioned *ruse* designed to insinuate that the People are the totality of the State. Besides, the basis of this view is the principle of isolated individuality – the absolute validity of the subjective will – a dogma which we have already investigated. The great point is, that Freedom in its Ideal conception has not subjective will and caprice for its principle, but the recognition of the universal will; and that the process by which Freedom is realised is the free development of its successive stages. The subjective will is a merely formal determination – a *carte blanche* – not including what it is that is willed. Only the *rational* will is that universal principle which independently determines and unfolds its own being, and develops its successive elemental phases as organic members. Of this Gothic-cathedral architecture the ancients knew nothing.

§ 50

At an earlier stage of the discussion, we established the two elemental considerations: first, the *idea* of freedom as the absolute and final aim; secondly, the *means* for realising it, *i.e.* the subjective side of knowledge and will, with its life, movement, and activity. We then recognised the State as the moral Whole and the Reality of Freedom, and consequently as the objective unity of these two elements. For although we make this distinction into two aspects for our consideration, it must be remarked that they are intimately connected; and that their connection is involved in the idea of each when examined separately. We have, on the one hand, recognised the Idea in the definite form of Freedom conscious of and willing itself, – having itself alone as its object: involving at the same time, the pure and simple Idea of Reason, and likewise, that which we have called subject –

self-consciousness – Spirit actually existing in the World. If, on the other hand, we consider Subjectivity, we find that subjective knowledge and will is Thought. But by the very act of thoughtful cognition and volition, I will the universal object – the substance of absolute Reason. We observe, therefore, an essential union between the objective side – the Idea, – and the subjective side – the personality that conceives and wills it. – The *objective* existence of this union is the State, which is therefore the basis and centre of the other concrete elements of the life of a people, – of Art, of Law, of Morals, of Religion, of Science. All the activity of Spirit has only this object – the becoming conscious of this union, i.e., of its own Freedom. Among the forms of this conscious union *Religion* occupies the highest position. In it, Spirit – rising above the limitations of temporal and secular existence – becomes conscious of the Absolute Spirit, and in this consciousness of the self-existent Being, renounces its individual interest; it lays this aside in Devotion – a state of mind in which it refuses to occupy itself any longer with the limited and particular. By Sacrifice man expresses his renunciation of his property, his will, his individual feelings. The religious concentration of the soul appears in the form of feeling; it nevertheless passes also into reflection; a form of worship (*cultus*) is a result of reflection. The second form of the union of the objective and subjective in the human spirit is *Art.* This advances farther into the realm of the actual and sensuous than Religion. In its noblest walk it is occupied with representing, not indeed, the Spirit of God, but certainly the Form of God; and in its secondary aims, that which is divine and spiritual generally. Its office is to render visible the Divine; presenting it to the imaginative and intuitive faculty. But the True is the object not only of conception and feeling, as in Religion, – and of Intuition, as in Art, – but also of the thinking faculty; and this gives us the third form of the union in question – *Philosophy*. This is consequently the highest, freest, and wisest phase. Of

course we are not intending to investigate these three phases here; they have only suggested themselves in virtue of their occupying the same general ground as the object here considered – the *State.*

§ 51

The general principle which manifests itself and becomes an object of consciousness in the State, – the form under which all that the State includes is brought, is the whole of that cycle of phenomena which constitutes the *culture* of a nation. But the definite *substance* that receives the form of universality, and exists in that concrete reality which is the State, – is the Spirit of the People itself. The actual State is animated by this spirit, in all its particular affairs – its Wars, Institutions, &c. But man must also attain a conscious realisation of this his Spirit and essential nature, and of his original identity with it. For we said that morality is the identity of the *subjective* or *personal* with the *universal* will. Now the mind must give itself an express consciousness of this; and the focus of this knowledge is *Religion.* Art and Science are only various aspects and forms of the same substantial being. In considering Religion, the chief point of enquiry is whether it recognises the True – the Idea – only in its separate, abstract form, or in its true unity; in *separation* – God being represented in an abstract form as the Highest Being, Lord of Heaven and Earth, living in a remote region far from human actualities, – or in its unity, – God, as Unity of the Universal and Individual; the Individual itself assuming the aspect of positive and real existence in the idea of the Incarnation. Religion is the sphere in which a nation gives itself the definition of that which it regards as the True. A definition contains everything that belongs to the essence of an object; reducing its nature to its simple characteristic predicate, as a mirror for every predicate, – the generic soul Pervading all its details. The

conception of God, therefore, constitutes the general basis of a people's character.

§ 52

In this aspect, religion stands in the closest connection with the political principle. Freedom can exist only where Individuality is recognised as having its positive and real existence in the Divine Being. The connection may be further explained thus: – Secular existence, as merely temporal – occupied with particular interests – is consequently only relative and unauthorised; and receives its validity only in as far as the universal soul that pervades it – its principle – receives absolute validity; which it cannot have unless it is recognised as the definite manifestation, the phenomenal existence of the Divine Essence. On this account it is that the State rests on Religion. We hear this often repeated in our times, though for the most part nothing further is meant than that individual subjects as God-fearing men would be more disposed and ready to perform their duty; since obedience to King and Law so naturally follows in the train of reverence for God. This reverence, indeed, since it exalts the general over the special, may even turn upon the latter, – become fanatical, – and work with incendiary and destructive violence against the State, its institutions, and arrangements. Religious feeling, therefore, it is thought, should be sober – kept in a certain degree of coolness, – that it may not storm against and bear down that which should be defended and preserved by it. The possibility of such a catastrophe is at least latent in it.

§ 53

While, however, the correct sentiment is adopted, that the State is based on Religion, the position thus assigned to Religion supposes the State already to exist; and that subsequently, in order to maintain it, Religion must be

brought into it – buckets and bushels as it were – and impressed upon people's hearts. It is quite true that men must be trained to religion, but not as to something whose existence has yet to begin. For in affirming that the State is based on Religion – that it has its roots in it – we virtually assert that the former has proceeded from the latter; and that this derivation is going on now and will always continue; *i.e.*, the principles of the State must be regarded as valid in and for themselves, which can only be in so far as they are recognised as determinate manifestations of the Divine Nature. The form of Religion, therefore, decides that of the State and its constitution. The latter actually originated in the particular religion adopted by the nation; so that, in fact, the Athenian or the Roman State was possible only in connection with the specific form of Heathenism existing among the respective peoples; just as a Catholic State has a spirit and constitution different from that of a Protestant one.

§ 54

If that outcry – that urging and striving for the implantation of Religion in the community – were an utterance of anguish and a call for help, as it often seems to be, expressing the danger of religion having vanished, or being about to vanish entirely from the State, – that would be fearful indeed – worse in fact than this outcry supposes; for it implies the belief in a resource against the evil, viz., the implantation and inculcation of religion; whereas religion is by no means a thing to be so produced; its *self-production* (and there can be no other) lies much deeper.

§ 55

Another and opposite folly which we meet with in our time is that of pretending to invent and carry out political constitutions independently of religion. The Catholic confession, although sharing the Christian name with

the Protestant, does not concede to the State an inherent Justice and Morality, – a concession which in the Protestant principle is fundamental. This tearing away of the political morality of the Constitution from its natural connection, is necessary to the genius of that religion, inasmuch as it does not recognise Justice and Morality as independent and substantial. But thus excluded from intrinsic worth, – torn away from their last refuge – the sanctuary of conscience – the calm retreat where religion has its abode, – the principles and institutions of political legislation are destitute of a real centre, to the same decree as they are compelled to remain abstract and indefinite.

§ 56

Summing up what has been said of the State, we find that we have been led to call its vital principle, as actuating the individuals who compose it, – Morality. The State, its laws, its arrangements, constitute the rights of its members; its natural features, its mountains, air, and waters, are *their* country, their fatherland, their outward material property; the history of this State, *their* deeds; what their ancestors have produced, belongs to them and lives in their memory. All is their possession, just as they are possessed by it; for it constitutes their existence, their being.

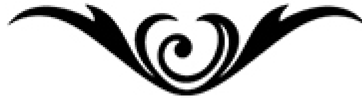
§ 57

Their imagination is occupied with the ideas thus presented, while the adoption of these laws, and of a fatherland so conditioned is the expression of their will. It is this matured totality which thus constitutes one Being, the spirit of *one* People. To it the individual members belong; each unit is the Son of his Nation, and at the same time – in as far as the State to which he belongs is undergoing development – the Son of his Age. None remains behind it, still less advances beyond it. This spiritual Being (the Spirit of his

Time) is his; he is a representative of it; it is that in which he originated, and in which he lives. Among the Athenians the word Athens had a double import; suggesting primarily, a complex of Political institutions, but no less, in the second place, that Goddess who represented the Spirit of the People and its unity. This Spirit of a People is a *determinate* and particular Spirit, and is, as just stated, further modified by the degree of its historical development. This Spirit, then, constitutes the basis and substance of those other forms of a nation's consciousness, which have been noticed. For Spirit in its self-consciousness must become a object of contemplation to itself, and objectivity involves, in the first instance, the rise of differences which make up a total of distinct spheres of objective spirit; in the same way as the Soul exists only as the complex of its faculties, which in their form of concentration in a simple unity produce that Soul. It is thus *One Individuality* which, presented in its essence as God, is honoured and enjoyed in *Religion;* which is exhibited as an object of sensuous contemplation in *Art;* and is apprehended as an intellectual conception in *Philosophy.* In virtue of the original identity of their essence, purport, and object, these various forms are inseparably united with the Spirit of the State. Only in connection with this particular religion can this particular political constitution exist; just as in such or such a State, such or such a Philosophy or order of Art.

§ 58

The remark next in order is, that each particular National genius is to be treated as only One Individual in the process of Universal History. For that history is the exhibition of the divine, absolute development of Spirit in its highest forms, – that gradation by which it attains its truth and consciousness of itself. The forms which these grades of progress assume are the characteristic "National Spirits" of History; the peculiar tenor of



their moral life, of their Government, their Art, Religion, and Science. To realise these grades is the boundless impulse of the World-Spirit – the goal of its irresistible urging; for this division into organic members, and the full development of each, is its Idea. – Universal History is exclusively occupied with showing how Spirit comes to a recognition and adoption of the Truth: the dawn of knowledge appears; it begins to discover salient principles, and at last it arrives at full consciousness.

§ 59

Having, therefore, learned the abstract characteristics of the nature of Spirit, the means which it uses to realise its Idea, and the shape assumed by it in its complete realisation in phenomenal existence – namely, the State – nothing further remains for this introductory section to contemplate but ...

III. THE COURSE OF THE WORLD'S HISTORY

§ 60

THE MUTATIONS WHICH history presents have been long characterised in the general, as an advance to something better, more perfect. The changes that take place in Nature — how infinitely manifold soever they may be — exhibit only a perpetually self-repeating cycle; in Nature there happens "nothing new under the sun," and the multiform play of its phenomena so far induces a feeling of ennui; only in those changes which take place in the region of Spirit does anything new arise. This peculiarity in the world of mind has indicated in the case of man an altogether different destiny from that of merely natural objects — in which we find always one and the same stable character, to which all change reverts; — namely, a real capacity for change, and that for the, better, — an impulse of *perfectibility.* This principle, which reduces change itself under a law, has met with an unfavourable reception from religions — such as the Catholic — and from States claiming as their just right a stereotyped, or at least a stable position. If the mutability of worldly things in general — political constitutions, for instance — is conceded, either Religion (as the Religion of *Truth)* is absolutely excepted, or the difficulty escaped by ascribing changes, revolutions, and abrogations of immaculate theories and institutions, to accidents or imprudence, — but principally to the levity and evil passions of man. The principle of Perfectibility indeed is almost as indefinite a term as mutability in general; it is without scope or goal, and has no standard by which to estimate the changes in question: the improved, more perfect, state of things towards which it professedly tends is altogether undetermined.

§ 61

The principle of *Development* involves also the existence of a latent germ of being — a capacity or potentiality striving to realise itself. This formal conception finds actual existence in Spirit; which has the History of the World for its theatre, its possession, and the sphere of its realisation. It is not of such a nature as to be tossed to and fro amid the superficial play of accidents, but is rather the absolute arbiter of things; entirely unmoved by contingencies, which, indeed, it applies and manages for its own purposes. Development, however, is also a property of organised natural objects. Their existence presents itself, not as an exclusively dependent one, subjected to external changes, but as one which expands itself in virtue of an external unchangeable principle; a simple essence, — whose existence, *i.e.*, as a germ, is primarily simple, — but which subsequently develops a variety of parts, that become involved with other objects, and consequently live through a continuous process of changes; — a process nevertheless, that results in the very contrary of change, and is even transformed into a *vis conservatrix* of the organic principle, and the form embodying it. Thus the organised *individuum* produces itself; it expands itself *actually* to what it was always *potentially:* So Spirit is only that which it attains by its own efforts; it makes itself *actually* what it always was *potentially*. — That development (of *natural organisms)* takes place in a direct, unopposed, unhindered manner. Between the Idea and its realisation — the essential constitution of the original germ and the conformity to it of the existence derived from it — no disturbing influence can intrude. But in relation to Spirit it is quite otherwise. The realisation of its Idea is mediated by consciousness and will; these very faculties are, in the first instance, sunk in their primary merely natural life; the first object and goal of their striving is the realisation of their merely natural destiny, — but which, since it is Spirit that animates it, is possessed of vast attractions and displays great power

and [moral] richness. Thus Spirit is at war with itself ; it has to overcome itself as its most formidable obstacle. That development which in the sphere of Nature is a peaceful growth, is in that of Spirit, a severe, a mighty conflict with itself. What Spirit really strives for is the realisation of its Ideal being; but in doing so, it hides that goal from its own vision, and is proud and well satisfied in this alienation from it.

§ 62

Its expansion, therefore, does not present the harmless tranquillity of mere growth, as does that of organic life, but a stern reluctant working against itself. It exhibits, moreover, not the mere formal conception of development, but the attainment of a definite result. The goal of attainment we determined at the outset: it is Spirit in its *completeness*, in its essential nature, *i.e.*, Freedom. This is the fundamental object, and therefore also the leading principle of the development, — that whereby it receives meaning and importance (as in the Roman history, Rome is the object — consequently that which directs our consideration of the facts related); as, conversely, the phenomena of the process have resulted from this principle alone, and only as referred to it, possess a sense and value. There are many considerable periods in History in which this development seems to have been intermitted; in which we might rather say, the whole enormous gain of previous culture appears to have been entirely lost; after which, unhappily, a new commencement has been necessary, made in the hope of recovering — by the assistance of some remains saved from the wreck of a former civilisation and by dint of a renewed incalculable expenditure of strength and time, — one of the regions which had been an ancient possession of that civilisation. We behold also *continued* processes of growth; structures and systems of culture in particular spheres, rich in kind, and well developed in every direction. The merely formal and indeterminate view of

development in general can neither assign to one form of expansion superiority over the other, nor render comprehensible the object of that decay of older periods of growth; but must regard such occurrences, — or, to speak more particularly, the retrocessions they exhibit, — as external contingencies; and can only judge of particular modes of development from indeterminate points of view; which — since the development as such, is all in all — are relative and not absolute goals of attainment.

§ 63

Universal History exhibits the *gradation* in the development of that principle whose substantial *purport* is the consciousness of Freedom. The analysis of the successive grades, in their abstract form, belongs to Logic; in their concrete aspect to the Philosophy of Spirit. Here it is sufficient to state that the first step in the process presents that immersion of Spirit in Nature which has been already referred to; the second shows it as advancing to the consciousness of its freedom. But this initial separation from Nature is imperfect and partial, since it is derived immediately from the merely natural state, is consequently related to it, and is still encumbered with it as an essentially connected element. The third step is the elevation of the soul from this still limited and special form of freedom to its pure universal form; that state in which the spiritual essence attains the consciousness and feeling of itself. These grades are the ground-principles of the general process; but how each of them on the other hand involves within *itself* a process of formation, — constituting the links in a dialectic of transition, — to particularise this may be reserved for the sequel.

§ 64

Here we have only to indicate that Spirit begins with a germ of infinite possibility, but *only* possibility, — containing its substantial existence in an

undeveloped form, as the object and goal which it reaches only in its resultant — full reality. In actual existence Progress appears as an advancing from the imperfect to the more perfect; but the former must not be understood abstractly as *only* the imperfect, but as something which involves the very opposite of itself — the so-called perfect — as a *germ* or impulse. So — reflectively, at least - *possibility* points to something destined to become actual; the Aristotelian is also *potentia*, power and might. Thus the Imperfect, as involving its opposite, is a contradiction, which certainly exists, but which is continually annulled and solved; the instinctive movement — the inherent impulse in the life of the soul — to break through the rind of mere nature, sensuousness, and that which is alien to it, and to attain to the light of consciousness, *i.e.* to itself.

§ 65

We have already made the remark how the commencement of the history of Spirit must be conceived so as to be in harmony with its Idea — in its bearing on the representations that have been made of a primitive "*natural* condition," in which freedom and justice are supposed to exist, or to have existed. This was, however, nothing more than an assumption of historical existence, conceived in the twilight of theorising reflection. A pretension of quite another order, — not a mere inference of reasoning, but making the claim of historical fact, and that supernaturally confirmed, — is put forth in connection with a different view that is now widely promulgated by a certain class of speculatists. This view takes up the idea of the primitive paradisaical condition of man, which had been previously expanded by the Theologians, after their fashion, — involving, *e.g.*, the supposition that God spoke with Adam in Hebrew, — but remodelled to suit other requirements. The high authority appealed to in the first instance is the biblical narrative. But this depicts the primitive condition, partly only in the few well-known

traits, but partly either as in man generically, — human nature at large, — or, so far as Adam is to be taken as an individual, and consequently one person, — as existing and completed in *this one*, or *only in one* human pair. The biblical account by no means justifies us in imagining *a people*, and an historical condition of such people, existing in that primitive form; still less does it warrant us in attributing to them the possession of a perfectly developed knowledge of God and Nature. "Nature," so the fiction runs, "like a clear mirror of God's creation, had originally lain revealed and transparent to the unclouded eye of man." [Fr. von Schlegel, *Philosophy of History* , Bohn's Standard Library.]

Divine Truth is imagined to have been equally manifest. It is even hinted, though left in some degree of obscurity, that in this primary condition men were in possession of an indefinitely extended and already expanded body of religious truths immediately revealed by God. This theory affirms that all religions had their historical commencement in this primitive knowledge, and that they polluted and obscured the original Truth by the monstrous creations of error and depravity; though in all the mythologies invented by Error, traces of that origin and of those primitive true dogmas are supposed to be present and cognisable. An important interest, therefore accrues to the investigation of the history of ancient peoples, that, viz., of the endeavour to trace their annals up to the point where such fragments of the primary revelation are to be met with in greater purity than lower down.

§ 66

We have to thank this interest for many valuable discoveries in Oriental literature, and for a renewed study of treasures previously known, in the department of ancient Asiatic Culture, Mythology, Religions, and History. In Catholic countries, where a refined literary taste prevails, Governments

have yielded to the requirements of speculative inquiry, and have felt the necessity of allying themselves with learning and philosophy. Eloquently and impressively has the Abbé Lamennais reckoned it among the criteria of the true religion, that it must be the universal — that is, catholic — and the oldest in date; and the Congregation has laboured zealously and diligently in France towards rendering such assertions no longer mere pulpit tirades and authoritative dicta, such as were deemed sufficient formerly. The religion of Buddha — a god man — which has prevailed to such an enormous extent, has especially attracted attention. The Indian Timûrtis, as also the Chinese abstraction of the Trinity, has furnished clearer evidence in point of subject matter. The savants, M. Abel Remusat and M. Saint Martin, on the one hand, have undertaken the most meritorious investigations in the Chinese literature, with a view to make this also a base of operations for researches in the Mongolian and, if such were possible, in the Tibetan; on the other hand, Baron von Eckstein, in his way (i.e., adopting from Germany superficial physical conceptions and mannerisms, in the style of Fr. v. Schlegel, though with more geniality than the latter) in his periodical, *Le Catholique*, — has furthered the cause of that primitive Catholicism generally, and in particular has gained for the savants of the Congregation the support of the Government; so that it has even set on foot expeditions to the East, in order to discover there treasures still concealed; (from which further disclosures have been anticipated, respecting profound theological questions, particularly on the higher antiquity and sources of Buddhism), and with a view to promote the interest of Catholicism by this circuitous but scientifically interesting method.

§ 67

We owe to the interest which has occasioned these investigations, very much that is valuable; but this investigation bears direct testimony against

itself for it would seem to be awaiting the issue of an historical demonstration of that which is presupposed by it as historically established. That advanced condition of the knowledge of God, and of other scientific, *e.g.*, astronomical knowledge (such as has been falsely attributed to the Hindus); and the assertion that such a condition occurred at the very beginning of History, — or that the religions of various nations were traditionally derived from it, and have developed themselves in degeneracy and depravation (as is represented in the rudely-conceived so-called "Emanation System,"); — all these are suppositions which neither have, nor, — if we may contrast with their arbitrary subjective origin, the true conception of History, — can attain historical confirmation.

§ 68

The only consistent and worthy method which philosophical investigation can adopt, is to take up History — where Rationality begins to manifest itself in the actual conduct of the World's affairs (not where it is merely an undeveloped potentiality), — where a condition of things is present in which it realises itself in consciousness, will and action. The inorganic existence of Spirit — that of abstract Freedom — unconscious *torpidity* in respect to good and evil (and consequently to laws), or, if we please to term it so, "blessed ignorance," — is itself not a subject of History. Natural, and at the same time *religious* morality, is the piety of the family. In this social relation, morality consists in the members behaving towards each other *not as individuals* - possessing an independent will; not as persons. The Family therefore is excluded from that process of development in which History takes its rise. But when this self-involved spiritual Unity steps beyond this circle of feeling and natural love, and first attains the consciousness of personality, we have that dark, dull centre of indifference, in which neither Nature nor Spirit is open and transparent; and for which Nature and Spirit

can become open and transparent only by means of a further process, — a very lengthened culture of that Will at length become self-conscious. Consciousness alone is clearness; and is that alone for which God (or any other existence) can be revealed. In its true form — in absolute universality — nothing can be manifested except to consciousness made percipient of it. Freedom is nothing but the recognition and adoption of such universal substantial objects as Right and Law, and the production of a reality that is accordant with them — the State. Nations may have passed a long life before arriving at this their destination, and during this period, they may have attained considerable culture in some directions. This ante-historical period — consistently with what has been said — lies out of our plan; whether a real history followed it, or the peoples in question never attained a political constitution. — It is a great discovery in history — as of a new world — which has been made within rather more than the last twenty years, respecting the Sanskrit and the connection of the European languages with it. In particular, the connection of the German and Indian peoples has been demonstrated, with as much certainty as such subjects allow of. Even at the present time we know of peoples which scarcely form a society, much less a State, but that have been long known as existing; while with regard to others, which in their advanced condition excite our especial interest, tradition reaches beyond the record of the founding of the State, and they experienced many changes prior to that epoch. In the connection just referred to, between the languages of nations so widely separated, we have a result before us, which proves the diffusion of those nations from Asia as a centre, and the so dissimilar development of what had been originally related, as an incontestable fact; not *as* an inference deduced by that favourite method of combining, and reasoning from, circumstances grave and trivial, which has already enriched and will continue to enrich history with so many fictions given out as facts. But that apparently so extensive

range of events lies beyond the pale of history; in fact preceded it. In our language the term *History* unites the objective with the subjective side, and denotes quite as much the *historia rerum gestarum*, as the *res gestae* themselves; on the other hand it comprehends not less what has *happened*, than the *narration* of what has happened. This union of the two meanings we must regard as of a higher order than mere outward accident; we must suppose historical narrations to have appeared contemporaneously with historical deeds and events. It is an internal vital principle common to both that produces them synchronously. Family memorials, patriarchal traditions, have an interest confined to the family and the clan. The uniform course of events which such a condition implies, is no subject of serious remembrance; though distinct transactions or turns of fortune, may rouse Mnemosyne to form conceptions of them, — in the same way as love and the religious emotions provoke imagination to give shape to a previously formless impulse. But it is the State which first presents subject-matter that is not only *adapted* to the prose of History, but involves the production of such history in the very progress of its own being. Instead of merely subjective mandates on the part of government, — sufficing for the needs of the moment, — a community that is acquiring a stable existence, and exalting itself into a State, requires formal commands and laws — comprehensive and universally binding prescriptions; and thus produces a record as well as an interest concerned with intelligent, definite — and, in their results — lasting transactions and occurrences; on which Mnemosyne, for the behoof of the perennial object of the formation and constitution of the State, is impelled to confer perpetuity. Profound sentiments generally, such as that of love, as also religious intuition and its conceptions, are in themselves complete — constantly present and satisfying; but that outward existence of a political constitution which is enshrined in its rational laws

and customs, is an *imperfect* Present; and cannot be thoroughly understood without a knowledge of the past.

§ 69

The periods — whether we suppose them to be centuries or millennia — that were passed by nations before history was written among them, — and which may have been filled with revolutions, nomadic wanderings, and the strangest mutations, — are on that very account destitute of *objective* history, because they present no *subjective* history, no annals. We need not suppose that the records of such periods have accidentally perished; rather, because they were not possible, do we find them wanting. Only in a State cognisant of Laws, can distinct transactions take place, accompanied by such a clear consciousness of them as supplies the ability and suggests the necessity of an enduring record. It strikes every one, in beginning to form an acquaintance with the treasures of Indian literature, that a land so rich in intellectual products, and those of the profoundest order of thought, has no History; and in this respect contrasts most strongly with China — an empire possessing one so remarkable, one going back to the most ancient times. India has not only ancient books relating to religion, and splendid poetical productions, but also ancient codes; the existence of which latter kind of literature has been mentioned as a condition necessary to the origination of History — and yet History itself is not found. But in that country the impulse of organisation, in beginning to develop social distinctions, was immediately petrified in the merely natural classification according to *castes;* so that although the laws concern themselves with civil rights, they make even these dependent on natural distinctions; and are especially occupied with determining the relations (Wrongs rather than Rights) of those classes towards each other, i.e., the privileges of the higher over the lower. Consequently, the element of morality is banished from the pomp of

Indian life and from its political institutions. Where that iron bondage of distinctions derived from nature prevails, the connection of society is nothing but wild arbitrariness, — transient activity, — or rather the play of violent emotion without any goal of advancement or development. Therefore no intelligent reminiscence, no object for Mnemosyne presents itself; and imagination — confused though profound — expatiates in a region, which, to be capable of History, must have had an aim within the domain of Reality, and, at the same time , of substantial Freedom.

§ 70

Since such are the conditions indispensable to a history, it has happened that the growth of Families to Clans, of Clans to Peoples, and their local diffusion consequent upon this numerical increased series of facts which itself suggests so many instances of social complication, war, revolution, and ruin, — a process which is so rich in interest, and so comprehensive in extent, — has occurred without giving rise to History: moreover, that the extension and organic growth of the empire of articulate sounds has itself remained voiceless and dumb, — a stealthy, unnoticed advance. It is a fact revealed by philological monuments, that languages, during a rude condition of the nations that have spoken them, have been very highly developed; that the human understanding occupied this theoretical region with great ingenuity and completeness. For Grammar, in its extended and consistent form, is the work of thought, which makes its categories distinctly visible therein. It is, moreover, a fact, that with advancing social and political civilisation, this systematic completeness of intelligence suffers attrition, and language thereupon becomes poorer and ruder: a singular phenomenon — that the progress towards a more highly intellectual condition, while expanding and cultivating rationality, should disregard that intelligent amplitude and expressiveness — should find it an

obstruction and contrive to do without it. Speech is the act of theoretic intelligence in a special sense; it is its *external* manifestation. Exercises of memory and imagination without language, are direct, [non-speculative] manifestations. But this act of theoretic intelligence itself, as also its subsequent development, and the more concrete class of facts connected with it, -viz. the spreading of peoples over the earth, their separation from each other, their comings and wanderings — remain involved in the obscurity of a voiceless past. They are not acts of Will becoming self-conscious — of Freedom, mirroring itself in a phenomenal form, and creating for itself a proper reality. Not partaking of this element of substantial, veritable existence, those nations — notwithstanding the development of language among them — never advanced to the possession of a *history.* The rapid growth of language, and the progress and dispersion of Nations, assume importance and interest for concrete Reason, only when they have come in contact with States, or begin to form political constitutions themselves.

§ 71

After these remarks, relating to the form of the *commencement* of the World's History, and to that ante-historical period which must be excluded from it, we have to state the direction of its course: though here only formally. The further definition of the subject in the concrete, comes under the head of arrangement.

§ 72

Universal history — as already demonstrated — shows the development of the consciousness of Freedom on the part of Spirit, and of the consequent realisation of that Freedom. This development implies a gradation — a series of increasingly adequate expressions or manifestations of Freedom,

which result from its Idea. The logical, and — as still more prominent — the *dialectical* nature of the Idea in general, viz. that it is self-determined — that it assumes successive forms which it successively transcends; and by this very process of transcending its earlier stages, gains an affirmative, and, in fact, a richer and more concrete shape; — this necessity of its nature, and the necessary series of pure abstract forms which the Idea successively assumes — is exhibited in the department of *Logic.* Here we need adopt only one of its results, viz. that every step in the process, as differing from any other, has its determinate peculiar principle. In history this principle is idiosyncrasy of Spirit — peculiar National Genius. It is within the limitations of this idiosyncrasy that the spirit of the nation, concretely manifested, expresses every aspect of its consciousness and will — the whole cycle of its realisation. Its religion, its polity, its ethics, its legislation, and even its science, art, and mechanical skill, all bear its stamp. These special peculiarities find their key in that common peculiarity, — the particular principle that characterises a people; as, on the other hand, in the facts which History presents in detail, that common characteristic principle may be detected. That such or such a specific quality constitutes the peculiar genius of a people, is the element of our inquiry which must be derived from experience, and historically proved. To accomplish this, presupposes not only a disciplined faculty of abstraction, but an intimate acquaintance with the Idea. The investigator must be familiar *a priori* (if we like to call it so), with the whole circle of conceptions to which the principles in question belong — just as Kepler (to name the most illustrious example in this mode of philosophising) must have been familiar *a priori* with ellipses, with cubes and squares, and with ideas of their relations before be could discover, from the empirical data, those immortal "Laws" of his, which are none other than forms of thought pertaining to those classes of conceptions. He who is unfamiliar with the science that embraces

these abstract elementary conceptions, is as little capable — though he may have gazed on the firmament and the motions of the celestial bodies for a life-time — of *understanding* those Laws, as of *discovering* them. From this want of acquaintance with the ideas that relate to the development of Freedom, proceed a part of those objections which are brought against the philosophical consideration of a science usually regarded as one of mere experience; the so-called *a priori* method, and the attempt to insinuate ideas into the empirical data of history, being the chief points in the indictment. Where this deficiency exists, such conceptions appear alien — not lying within the object of investigation. To minds whose training has been narrow and merely subjective, — which have not an acquaintance and familiarity with ideas, — they are something strange — not embraced in the notion and conception of the subject which their limited intellect forms. Hence the statement that Philosophy does not understand such sciences. It must, indeed, allow that it has not that kind of Understanding which is the prevailing one in the domain of those sciences that it does not proceed according to the categories of such Understanding, but according to the categories of *Reason* - though at the same time recognising that Understanding, and its true value and position. It must be observed that in this very process of scientific *Understanding*, it is of importance that the essential should be distinguished and brought into relief in contrast with the so-called non-essential. But in order to render this possible, we must know what *is essential;* and that is — in view of the History of the World in general — the Consciousness of Freedom, and the phases which this consciousness assumes in developing itself. The bearing of historical facts on this category, is their bearing on the truly Essential. Of the difficulties stated, and the opposition exhibited to comprehensive conceptions in science, part must be referred to the inability to grasp and understand Ideas. If in Natural History some monstrous hybrid growth is alleged as an

objection to the recognition of clear and indubitable classes or species, a sufficient reply is furnished by a sentiment often vaguely urged, — that "the exception confirms the rule;" i.e., that it is the part of a well-defined rule, to hew the conditions in which it applies, or the deficiency or hybridism of cases that are abnormal. Mere Nature is too weak to keep its genera and species pure, when conflicting with alien elementary influences. If, *e.g.*, on considering the human organisation in its concrete aspect, we assert that brain, heart, and so forth are essential to its organic life, some miserable abortion may be adduced, which has on the whole the human form, or parts of it, — which has been conceived in a human body and has breathed after birth therefrom, — in which nevertheless no brain and no heart is found. If such an instance is quoted against the general conception of a human being — the objector persisting in using the name, coupled with a superficial idea respecting it — it can be proved that a real, concrete human being, is a truly different object; that such a being must have a brain in its bead, and a heart in its breast.

§ 73

A similar process of reasoning is adopted, in reference to the correct assertion that genius, talent, moral virtues, and sentiments, and piety, may be found in every zone, under all political constitutions and conditions; in confirmation of which examples are forthcoming in abundance. If in this assertion, the accompanying distinctions are intended to be repudiated as unimportant or non-essential, reflection evidently limits itself to abstract categories; and ignores the specialities of the object in question, which certainly fall under no principle recognised by such categories. That intellectual position which adopts such merely formal points of view, presents a vast field for ingenious questions, erudite views, and striking comparisons; for profound seeming reflections and declamations, which

may be rendered so much the more brilliant in proportion as the subject they refer to is indefinite, and are susceptible of new and varied forms in inverse proportion to the importance of the results that can be gained from them, and the certainly and rationality of their issues. Under such an aspect the well known Indian Epopees may be compared with the Homeric; perhaps — since it is the vastness of the imagination by which poetical genius proves itself — preferred to them; as, on account of the similarity of single strokes of imagination in the attributes of the divinities, it has been contended that Greek mythological forms may be recognised in those of India. Similarly the Chinese philosophy, as adopting the One as its basis, has been alleged to be the same as at a later period appeared as Eleatic philosophy and as the Spinozistic System; while in virtue of its expressing itself also in abstract numbers and lines, Pythagorean and Christian principles have been supposed to be detected in it. Instances of bravery and indomitable courage, — traits of magnanimity, of self-denial, and self-sacrifice, which are found among the most savage and the most pusillanimous nations, — are regarded as sufficient to support the view that in these nations as much of social virtue and morality may be found as in the most civilised Christian states, or even more. And on this ground a doubt has been suggested whether in the progress of history and of general culture mankind have become better; whether their morality has been increased, — morality being regarded in a subjective aspect and view, as founded on what the agent holds to be right and wrong, good and evil; not on a principle which is considered to be in and for itself right and good, or a crime and evil, or on a particular religion believed to be the true one.

§ 74

We may fairly decline on this occasion the task of tracing the formalism and error of such a view, and establishing the true principles of morality, or

rather of social virtue in opposition to false morality. For the History of the World occupies a higher ground than that on which morality has properly its position, which is personal character — the conscience of individuals, — their particular will and mode of action; *these* have a value, imputation, reward or, punishment proper to themselves. What the absolute aim of Spirit requires and accomplishes, — what Providence does, — transcends the obligations, and the liability to imputation and the ascription of good or bad motives, which attach to individuality in virtue of its social relations. They who on moral grounds, and consequently with noble intention, have resisted that which the advance of the Spiritual Idea makes necessary, stand higher in moral worth than those whose crimes have been turned into the means — under the direction of a superior principle — of realising the purposes of that principle. But in such revolutions both parties generally stand within the limits of the same circle of transient and corruptible existence. Consequently it is only a formal rectitude — deserted by the living Spirit and by God — which those who stand upon ancient right and order maintain. The deeds of great men, who are the Individuals of the World's History, thus appear not only justified in view of that intrinsic result of which they were not conscious, but also from the point of view occupied by the secular moralist. But looked at from this point, moral claims that are irrelevant, must not be brought into collision with world-historical deeds and their accomplishment. The Litany of private virtues — modesty, humility, philanthropy and forbearance — must not be raised against them. The History of the World might, on principle, entirely ignore the circle within which morality and the so much talked of distinction between the moral and the politic lies — not only in abstaining from judgments, for the principles involved, and the necessary reference of the deeds in question to those principles, are a sufficient judgment of them — but in leaving Individuals quite out of view and unmentioned. What it has to record is the

activity of the Spirit of Peoples, so that the individual forms which that spirit has assumed in the sphere of outward reality, might be left to the delineation of special histories.

§ 75

The same kind of formalism avails itself in its peculiar manner of the indefiniteness attaching to genius, poetry, and even philosophy; thinks equally that it finds these everywhere. We have here products of reflective thought; and it is familiarity with those general conceptions which single out and name real distinctions without fathoming the true depth of the matter, — that we call Culture. It is something merely formal, inasmuch as it aims at nothing more than the analysis of the subject, whatever it be, into its constituent parts, and the comprehension of these in their logical definitions and forms. It is not the free universality of conception necessary for making an abstract principle the object of consciousness. Such a consciousness of Thought itself, and of its forms isolated from a particular object, is Philosophy. This has, indeed, the condition of its existence in culture; that condition being the taking up of the object of thought, and at the same time clothing it with the form of universality, in such a way that the material content and the form given by the intellect are held in an inseparable state; — inseparable to such a degree that the object in question -which, by the analysis of one conception into a multitude of conceptions, is enlarged to an incalculable treasure of thought — is regarded as a merely empirical datum in whose formation thought has bad no share.

§ 76

But it is quite as much an act of Thought — of the Understanding in particular — to embrace in one simple conception object which of itself comprehends a concrete and large significance (as Earth, Man, -Alexander

or Caesar) and to designate it by one word, — as to *resolve* such a conception — duly to isolate in idea the conceptions which it contains, and to give them particular names. And in reference to the view which gave occasion to what has just been said, thus much will be clear, — that as reflection produces what we include under the general terms Genius, Talent, Art, Science, — formal culture on every grade of intellectual development, not only can, but must grow, and attain a mature bloom, while the grade in question is developing itself to a State, and on this basis of civilisation is advancing to intelligent reflection and to general forms of thought, — as in laws, so in regard to all else. In the very association of men in a state, lies the necessity of formal culture — consequently of the rise of the sciences and of a cultivated poetry and art generally. The arts designated "plastic," require besides, even in their technical aspect, the civilised association of men. The poetic art — which has less need of external requirements and means, and which has the element of immediate existence, the voice, as its material — steps forth with great boldness and with matured expression, even under the conditions presented by a people not yet united in a political combination; since, as remarked above, language attains on its own particular ground a high intellectual development, prior to the commencement of civilisation.

§ 77

Philosophy also must make its appearance where political life exists; since that in virtue of which any series of phenomena is reduced within the sphere of culture, as above stated, is the Form strictly proper to Thought; and thus for philosophy, which is nothing other than the consciousness of this form itself — the Thinking of Thinking,- the material of which its edifice is to be constructed, is already prepared by *general* culture. If in the development of the State itself, periods are necessitated which impel the soul of nobler

natures to seek refuge from the Present in ideal regions, — in order to find in them that harmony with itself which it can no longer enjoy in the discordant real world, where the reflective intelligence attacks all that is holy and deep, which had been spontaneously inwrought into the religion, laws and manners of nations, and brings them down and attenuates them to abstract godless generalities, — Thought will be compelled to become Thinking Reason, with the view of effecting in its own element, the restoration of its principles from the ruin to which they had been brought.

§ 78

We find then, it is true, among all world-historical peoples, poetry, plastic art, science, even philosophy; but not only is there a diversity in style and bearing generally, but still more remarkably in subject-matter; and this is a diversity of the most important kind, affecting the rationality of that subject-matter. It is useless for a pretentious aesthetic criticism to demand that our good pleasure should not be made the rule for the matter — the substantial part of their contents — and to maintain that it is the beautiful form as such, the grandeur of the fancy, and so forth, which fine art aims at, and which must be considered and enjoyed by a liberal taste and cultivated mind. A healthy intellect does not tolerate such abstractions, and cannot assimilate productions of the kind above referred to. Granted that the Indian Epopees might be placed on a level with the Homeric, on account of a number of those qualities of form — grandeur of invention and imaginative power, liveliness of images and emotions, and beauty of diction; yet the infinite difference of matter remains; consequently one of substantial importance and involving the interest of Reason which is immediately concerned with the consciousness of the Idea of Freedom, and its expression in individuals. There is not only a classical form, but a classical order of *subject-matter;* and in a work of art form and subject-matter are so closely united that the

former can only be classical to the extent to which the latter is so. With a fantastic, indeterminate material — the *Rule* is the essence of *Reason* -the form becomes measureless and formless, or mean and contracted. In the same way, in that comparison of the various systems of philosophy of which we have already spoken, the only point of importance is overlooked, namely the character of that Unity which is found alike in the Chinese, the Eleatic, and the Spinozistic philosophy — the distinction between the recognition of that Unity as abstract and as concrete — concrete to the extent of being a unity in and by itself — a unity synonymous with Spirit. But that co-ordination proves that it recognises only such an abstract unity; so that while it gives judgment respecting philosophy it is ignorant of that very point which constitutes the interest of philosophy.

§ 79

But there are also spheres which, amid all the variety that is presented in the substantial content of a particular form of culture, remain the same. The difference above mentioned in art, science, philosophy, concerns the thinking Reason and Freedom, which is the self-consciousness of the former, and which has the same one root with Thought. As it is not the brute, but only the man that thinks, he only — and only because he is a thinking being — has Freedom. *His* consciousness imports this, that the individual comprehends itself as a *person*, that is, recognises itself in its single existence as possessing universality, — as capable of abstraction from, and of surrendering all speciality; and, therefore, as inherently infinite. Consequently those spheres of intelligence which lie beyond the limits of this consciousness are a common ground among those substantial distinctions. Even morality, which is so intimately connected with the consciousness of freedom, can be very pure while that consciousness is still wanting; as far, that is to say, as it expresses duties and rights only as

objective commands; or even as far as it remains satisfied with the merely formal elevation of the soul — the surrender of the sensual, and of all sensual motives — in a purely negative, self-denying fashion. The *Chinese* morality — since Europeans have become acquainted with it and with the writings of Confucius — has obtained the greatest praise and proportionate attention from those who are familiar with the Christian morality. There is a similar acknowledgment of the sublimity with which the *Indian* religion and poetry, (a statement that must, however, be limited to the higher kind), but especially the Indian philosophy, expatiate upon and demand the removal and sacrifice of sensuality. Yet both these nations are, it must be confessed, *entirely* wanting in the essential consciousness of the Idea of Freedom. To the Chinese their moral laws are just like natural laws, — external, positive commands, — claims established by force, — compulsory duties or rules of courtesy towards each other. Freedom, through which alone the essential, determinations of Reason become moral sentiments, is wanting. Morality is a political affair, and its laws are administered by officers of government and legal tribunals. Their treatises upon it (which are not law books, but are certainly addressed to the subjective will and individual disposition) read, — as do the moral writings of the Stoics — like a string of commands stated as necessary for realising the goal of happiness; so that it seems to be left free to men, on their part, to adopt such commands, — to observe them or not; while the conception of an abstract subject, "a wise man" [Sapiens] forms the culminating point among the Chinese, as also among the Stoic moralists. Also in the Indian doctrine of the renunciation of the sensuality of desires and earthly interests, positive moral freedom is not the object and end, but the annihilation of consciousness — spiritual and even physical privation of life.

§ 80

It is the concrete spirit of a people which we have distinctly to recognise, and since it is Spirit it can only be comprehended spiritually, that is, by thought. It is this alone which takes the lead in all the deeds and tendencies of that people, and which is occupied in realising itself, — in satisfying its ideal and becoming self-conscious, — for its great business is self-production. But for spirit, the highest attainment is self-knowledge; an advance not only to the *intuition,* but to the *thought* — the clear conception of itself. This it must and is also destined to accomplish; but the accomplishment is at the same time its dissolution., and the rise of another spirit, another world-historical people, another epoch of Universal History. This transition and connection leads us to the connection of the whole — the idea of the World's History as such — which we have now to consider more closely, and of which we have to give a representation.

§ 81

History in general is therefore the development of Spirit in *Time*, as Nature is the development of the Idea in *Space.*

§ 82

If then we cast a glance over the World's History generally, we see a vast picture of changes and transactions; of infinitely manifold forms of peoples, states, individuals, in unresting succession. Everything that can enter into and interest the soul of man — all our sensibility to *goodness, beauty, and greatness* — is called into play. On every hand aims are adopted and pursued, which we recognise, whose accomplishment we desire — we hope and fear for them. In all these occurrences and changes we behold human action and suffering predominant; everywhere something akin to ourselves, and therefore everywhere something that excites our interest for or against. Sometimes it attracts us by beauty, freedom, and rich variety, sometimes by

energy such as enables even vice to make itself interesting. Sometimes we see the more comprehensive mass of some general interest advancing with comparative slowness and subsequently sacrificed to an infinite complication of trifling circumstances, and so dissipated into atoms. Then, again, with a vast expenditure of power a trivial result is produced; while from what appears unimportant a tremendous issue proceeds. On every hand there is the motliest throng of events drawing us within the circle of its interest, and when one combination vanishes another immediately appears in its place.

§ 83

The general thought — the category which first presents itself in this restless mutation of individuals and peoples, existing for a time and then vanishing — is that of *change* at large. The sight of the ruins of some ancient sovereignty directly leads us to contemplate this thought of change in its negative aspect. What traveller among the ruins of Carthage, of Palmyra, Persepolis, or Rome, has not been stimulated by reflections on the transience of kingdoms and men, and to sadness at the thought of a vigorous and rich life now departed — a sadness which does not expend itself on personal losses and the uncertainty of one's own undertakings, but is a disinterested sorrow at the decay of a splendid and highly cultured national life! But the next consideration which allies itself with that of change, is, that chance while it imports dissolution, involves at the same time the rise of *a new life* — that while death is the issue of life, life is also the issue of death. This is a grand conception; one which the Oriental thinkers attained and which is perhaps the highest in their metaphysics. In the Idea of *Metempsychosis* we find it evolved in its relation to individual existence; but a myth more generally known, is that of the *Phoenix* as a type of the Life of *Nature;* eternally preparing for itself its funeral pile, and consuming

itself upon it; but so that from its ashes is produced the new, renovated, fresh life. But this image is only Asiatic; oriental not occidental. Spirit — consuming the envelope of its existence — does not merely pass into another envelope, nor rise rejuvenescent from the ashes of its previous form; it comes forth exalted, glorified, a purer spirit. It certainly makes war upon itself — consumes its own existence; but in this very destruction it works up with existence into a new form, and each successive phase becomes in its turn a material, working on which it exalts itself to a new grade.

§ 84

If we consider Spirit in this aspect — regarding its changes not merely as rejuvenescent transitions, i.e., returns to the same form, but rather as manipulations of itself, by which it multiplies the material for future endeavours — we see it exerting itself in a variety of modes and directions; developing its powers and gratifying its desires in a variety which is inexhaustible; because every one of its creations, in which it has already found gratification, meets it anew as material, and is a new stimulus to plastic activity. The abstract conception of mere change gives place to the thought of Spirit manifesting, developing, and perfecting its powers in every direction which its manifold nature can follow. What powers it inherently possesses we learn from the variety of products and formations which it originates. In this pleasurable activity, it has to do only with itself. As involved with the conditions of mere nature — internal and external — it will indeed meet in these not only opposition and hindrance, but will often see its endeavours thereby fail; often sink under the complications in which it is entangled either by Nature or by itself. But in such case it perishes in fulfilling its own destiny and proper function, and even thus exhibits the spectacle of self-demonstration as spiritual activity.

§ 85

The very essence of Spirit is activity; it realises its potentiality — makes itself its own deeds its own work — and thus it becomes an object to itself; contemplates itself as an objective existence. Thus is it with the Spirit of a people: it is a Spirit having strictly defined characteristics., which erects itself into an objective world, that exists and persists in a particular religious form of worship, customs, constitution and political laws, — in the whole complex of its institutions, — in the events and transactions that make up its history. That is its work — that is what this particular Nation *is*. Nations are what their deeds are. Every Englishman will say: We are the men who navigate the ocean, and have the commerce of the world; to whom the East Indies belong and their riches; who have a parliament, juries, &c.- The relation of the individual to that Spirit is that he appropriates to himself this substantial existence; that it becomes his character and capability, enabling him to have a definite place in the world — to be *something*. For he finds the being of the people to which he belongs an already established, firm world — objectively present to him — with which he has to incorporate himself. In this its work, therefore — its world — the Spirit of the people enjoys its existence and finds its satisfaction. — A Nation is moral — virtuous — vigorous — while it is engaged in realising its grand objects, and defends its work against external violence during the process of giving to its purposes an objective existence. The contradiction between its potential, subjective being — its inner aim and life — and its *actual* being is removed; it has attained full reality, has itself objectively present to it. But this having been attained, the activity played by the Spirit of the people in question is no longer needed; it has its desire. The Nation can still accomplish much in war and peace at home and abroad; but the living substantial soul itself may be said to have ceased its activity. The essential, supreme interest has consequently vanished from its life, for interest is

present only where there is opposition. The nation lives the same kind of life as the individual when passing from maturity to old age, — in the enjoyment of itself, — in the satisfaction of being exactly what it desired and was able to attain. Although its imagination might have transcended that limit, it nevertheless abandoned any such aspirations as objects of *actual endeavour*, if the real world was less than favourable to their attainment — and restricted its aim by the conditions thus imposed. This mere *customary life* (the watch wound up and going on of itself) is that which brings on natural death. Custom is activity without opposition, for which there remains only a formal duration; in which the fullness and zest that originally characterised the aim of life is out of the questions merely external sensuous existence which has ceased to throw itself enthusiastically into its object. Thus perish individuals, thus perish peoples by a natural death; and though the latter may continue in being, it is an existence without intellect or vitality; having no need of its institutions, because the need for them is satisfied, — a political nullity and tedium. In order that a truly universal interest may arise, the Spirit of a People must advance to the adoption of some new purpose: but whence can this new purpose originate? It would be a higher, more comprehensive conception of itself — a transcending of its principle — but this very act would involve a principle of a new order, a new National Spirit.

§ 86

Such a new principle does in fact enter into the Spirit of a people that has arrived at full development and self-realisation; it dies not a simply natural death — for it is not a mere single individual, but a spiritual, generic life; in its case natural death appears to imply destruction through its own agency. The reason of this difference from the single natural individual is that the Spirit of a people exists as a *genus*, and consequently carries within it its

own negation, in the very generality which characterises it. A people can only die a violent death when it has become naturally dead in itself, as *e.g.*, the German Imperial Cities, the German Imperial Constitution.

§ 87

It is not of the nature of the all-pervading Spirit to die this merely natural death; it does not simply sink into the senile life of mere custom but — as being a National Spirit belonging to Universal History — attains to the consciousness of what its work is; it attains to a conception of itself. In fact it is world-historical only in so far as a *universal principle* has lain in its fundamental element, — in its grand aim: only so far is the work which such a spirit produces, a moral, political organisation. If it be mere desires that impel nations to activity, such deeds pass over without leaving a trace; or their traces are only ruin and destruction. Thus, it was first Chronos — Time — that ruled; the Golden Age, without moral products; and what was produced — the offspring of that Chronos — was devoured by it. It was Jupiter — from whose head Minerva sprang, and to whose circle of divinities belong Apollo and the Muses — that first put a constraint upon Time, and set a bound to its principle of decadence. He is the Political god, who produced a moral work — the State.

§ 88

In the very element of an achievement the quality of generality, of thought, is contained; without thought it has no objectivity; that is its basis. The highest point in the development of a people is this, — to have gained a conception of its life and condition, — to have reduced its laws, its ideas of justice and morality to a science; for in this unity [of the objective and subjective] lies the most intimate unity that Spirit can attain to in and with itself. In its work it is employed in rendering itself an object of its own

contemplation; but it cannot develop itself objectively in its essential nature, except in *thinking* itself.

§ 89

At this point, then, Spirit is acquainted with its principles — the general character of its acts. But at the same time, in virtue of its very generality, this work of thought is different in point of form from the actual achievements of the national genius, and from the vital agency by which those achievements have been performed. We have then before us a *real* and an *ideal* existence of the Spirit of the Nation. If we wish to gain the general idea and conception of what the Greeks were, we find it in Sophocles and Aristophanes, in Thucydides and Plato. In these individuals the Greek spirit conceived and thought itself. This is the profounder kind of satisfaction which the Spirit of a people attains; but it is "ideal," and distinct from its "real" activity.

§ 90

At such a time, therefore, we are sure to see a people finding satisfaction in the *idea* of virtue; putting *talk* about virtue partly side by side with actual virtue, but partly in the place of it. On the other hand pure, universal thought, since its nature is universality, is apt to bring the Special and Spontaneous — Belief, Trust, Customary Morality — to reflect upon itself, and its primitive simplicity; to show up the limitation with which it is fettered, — partly suggesting reasons for renouncing duties, partly itself *demanding reasons*, and the connection of such requirements with Universal Thought; and not finding that connection, seeking to impeach the authority of duty generally, as destitute of a sound foundation.

§ 91

At the same time the isolation of individuals from each other and from the Whole makes its appearance; their aggressive selfishness and vanity; their seeking personal advantage and consulting this at the expense of the State at large. That inward principle in transcending its outward manifestations is subjective also in form — viz., selfishness and corruption in the unbound passions and egotistic interests of men.

§ 92

Zeus, therefore, who is represented as having put a limit to the devouring agency of Time, and staid this transience by having established something inherently and independently durable — Zeus and his race are themselves swallowed up, and that by the very power that produced them — the principle of thought, perception, reasoning, insight derived from rational grounds, and the requirement of such grounds.

§ 93

Time is the negative element in the sensuous world. Thought is the same negativity, but it is the deepest, the infinite form of it, in which therefore all existence generally is dissolved; first *finite* existence, — *determinate*, limited form: but existence *generally,* in its objective character, is limited; it appears therefore as a mere datum — something immediate — authority; — and is either intrinsically finite and limited, or presents itself as a limit for the thinking subject, and its infinite reflection on itself [unlimited abstraction].

§ 94

But first we must observe how the life which proceeds from death, is itself, on the other hand, only individual life; so that, regarding the species as the

real and substantial in this vicissitude, the perishing of the individual is a regress of the species into individuality. The perpetuation of the race is, therefore, none other than the monotonous repetition of the same kind of existence. Further, we must remark how perception, — the comprehension of being by thought, — is the source and birthplace of a new, and in fact higher form, in a principle which while it preserves, dignifies its material. For Thought is that *Universal* - that *Species* which is immortal, which preserves identity with itself. The particular form of Spirit not merely passes away in the world by natural causes in Time, but is annulled in the automatic self-mirroring activity of consciousness. Because this annulling is an activity of Thought, it is at the same time conservative and elevating in its operation. While then, on the one side, Spirit annuls the reality, the permanence of that which it is, it gains on the other side, the essence, the Thought, the Universal element of that which it *only was* [its transient conditions]. Its principle is no longer that immediate import and aim which it was previously, but *the essence* of that import and aim.

§ 95

The result of this process is then that Spirit, in rendering itself objective and making this its being an object of thought, on the one hand destroys the determinate form of its being, on the other hand gains a comprehension of the universal element which it involves, and thereby gives a new form to its inherent principle. In virtue of this, the substantial character of the National Spirit has been altered, — that is, its principle has risen into another, and in fact a higher principle.

§ 96

It is of the highest importance in apprehending and comprehending History to have and to understand the thought involved in this transition. The

individual traverses as a unity various grades of development, and remains the same individual; in like manner also does a people, till the Spirit which it embodies reaches the grade of universality. In this point lies the fundamental, the Ideal necessity of transition. This is the soul — the essential consideration — of the philosophical comprehension of History.

§ 97

Spirit is essentially the result of its own activity; its activity is the transcending of immediate, simple, unreflected existence, — the negation of that existence, and the returning into itself. We may compare it with the seed; for with this the plant begins, yet it is also the result of the plant's entire life. But the weak side of life is exhibited in the fact that the commencement and the result are disjoined from each other. Thus also is it in the life of individuals and peoples. The life of a people ripens a certain fruit; its activity aims at the complete manifestation of the principle which it embodies. But this fruit does not fall back into the bosom of the people that produced and matured it; on the contrary, it becomes a poison-draught to it. That poison-draught it cannot let alone, for it has an insatiable thirst for it: the taste of the draught is its annihilation., though at the same time the rise of a new principle.

§ 98

We have already discussed the final aim of progression. The principles of the successive phases of Spirit that animate the Nations in a necessitated gradation, are themselves only steps in the development of the one universal Spirit, which through them elevates and completes itself to a self-comprehending *totality.*

§ 99

While we are thus concerned exclusively with the Idea of Spirit, and in the History of the World regard everything as only its manifestation, we have, in traversing the past, — however extensive its periods, — only to do with what is *present;* for philosophy, as occupying itself with the True, has to do with the *eternally present.* Nothing in the past is lost for it, for the Idea is ever present; Spirit is immortal; with it there is no past, no future, but an essential now. This necessarily implies that the present form of Spirit comprehends within it all earlier steps. These have indeed unfolded themselves in succession independently; but what Spirit is it has always been essentially; distinctions are only the development of this essential nature. The life of the ever present Spirit is a circle of progressive embodiments, which looked at in one respect still exist beside each other, and only as looked at from another point of view appear as past. The grades which Spirit seems to have left behind it, it still possesses in the depths of its present.

Lectures on the History of Philosophy

Translated by Elizabeth Sanderson Haldane

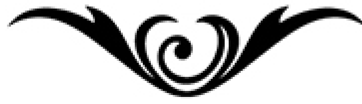
Lectures on the History of Philosophy is a compilation of notes from Hegel's university lectures, outlining his ideas and interpretations of the major philosophers of history. In these lectures, he regards consciousness as progressing from an undifferentiated pantheism of the East to a more individualistic understanding culminating in the freedom of the Germanic era. Hegel cites extensively the voluminous histories of philosophy written in Germany after 1740, including Johann Jakob Brucker's *Historia critica philosophiae*, Johann Buhle's *Lehrbuch der Geschichte der Philosophie*, Dietrich Tiedemann's *Geist der spekulativen Philosophie von Thales bis Berkeley* and Wilhelm Gottlieb Tennemann's *Geschichte der Philosophie*.

Wilhelm Gottlieb Tennemann (1761-1819) was a German historian of philosophy.

CONTENTS

TRANSLATOR'S NOTE

IT IS PERHAPS unnecessary to say anything respecting the difficulty of making any adequate translation of Hegel's writings. In the case of the History of Philosophy, that difficulty is possibly enhanced by the fact that the greater part of the book is put together from the notes of different courses of lectures delivered on the subject at various times. Hegel, as we learn from Michelet, in his preface to the first edition of this work, lectured in all nine times on the History of Philosophy: first in Jena in 1805-1806, then in Heidelberg in 1816-1817 and 1817-1818, and the other six times in Berlin between the years 1819 and 1830. He had begun the tenth course on the subject in 1831 when death cut his labours short. It was only for the first course of lectures — that delivered in Jena — that Hegel fully wrote out his lectures; this was evidently done with the intention of future publication in book form. At Heidelberg he composed a short abstract of his subject, giving in a few terse words the main points dealt with in each system of Philosophy. In the later courses of lectures Hegel trusted to extempore speaking, but at the same time made considerable use of the above writings, the margins of which he annotated with subsequent additions. Besides these annotations he left behind him a large number of miscellaneous notes, which have proved of the greatest value. The present translation is taken from the second and amended edition of the "Geschichte der Philosophie," published in 1840. This edition is derived from no one set of lectures in particular, but carefully prepared by Michelet — himself one of Hegel's pupils — from all available sources, including the notes of students. The Jena volume is, however, made the basis, as representing the main elements



of the subject afterwards to be more fully amplified; or, in Michelet's words, as the skeleton which was afterwards to be clothed with flesh.

I have endeavoured to make this translation as literal as possible consistently with intelligibility, and have attempted, so far as might be, to give the recognized symbols for the words for which we have in English no satisfactory equivalents. "Begriff," when used in its technical sense, is translated by "Notion," "Idee" by "Idea," as distinguished from the colloquial "idea"; "Vorstellung" is usually rendered by "popular" or "ordinary conception."

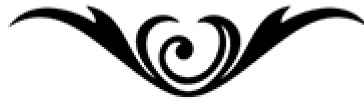
Miss Frances H. Simson has rendered very valuable assistance in going carefully over most of the proofs of the first volume, and she is now engaged with me in the translation of the volumes following.

E. S. H.

INAUGURAL ADDRESS

DELIVERED AT HEIDELBERG on the 28th October, 1816

Gentlemen, — Since the History of Philosophy is to be the subject of these lectures, and to-day I am making my first appearance in this University, I hope you will allow me to say what satisfaction it gives me to take my place once more in an Academy of Learning at this particular time. For the period seems to have been arrived at when Philosophy may again hope to receive some attention and love — this almost dead science may again raise its voice, and hope that the world which had become deaf to its teaching, may once more lend it an ear. The necessities of the time have accorded to the petty interests of every-day life such overwhelming attention: the deep interests of actuality and the strife respecting these have engrossed all the powers and the forces of the mind — as also the necessary means — to so great an extent, that no place has been left to the higher inward life, the intellectual operations of a purer sort; and the better natures have thus been stunted in their growth, and in great measure sacrificed. Because the spirit of the world was thus occupied, it could not look within and withdraw into itself. But since this stream of actuality is checked, since the German nation has cut its way out of its most material conditions, since its nationality, the basis of all higher life, has been saved, we may hope that, in addition to the State, which has swallowed up all other interests in its own, the Church may now resume her high position — that in addition to the kingdom of the world to which all thoughts and efforts have hitherto been directed; the Kingdom of God may also be considered. In other words, along with the business of politics and the other interests of every-day life,



we may trust that Science, the free rational world of mind, may again flourish.

We shall see in the History of Philosophy that in other European countries in which the sciences and the cultivation of the understanding have been prosecuted with zeal and with respect, Philosophy, excepting in name, has sunk even from memory, and that it is in the German nation that it has been retained as a peculiar possession. We have received the higher call of Nature to be the conservers of this holy flame, just as the Eumolpidæ in Athens had the conservation of the Eleusinian mysteries, the inhabitants of the island of Samothrace the preservation and maintenance of a higher divine service; and as, earlier still, the World-spirit reserved to the Jewish nation the highest consciousness that it should once more rise from thence as a new spiritual force. We have already got so far, and have attained to a seriousness so much greater and a consciousness so much deeper, that for us ideas and that which our reason justifies, can alone have weight; to speak more plainly, the Prussian State is a State constituted on principles of intelligence. But the needs of the time and the interests of the events in the world already mentioned, have repressed a real and earnest effort after Philosophy and driven hence any general attention to it. It has thus happened that because vigorous natures turned to the practical, insipidity and dulness appropriated to themselves the preeminence in Philosophy and flourished there. It may indeed be said that since Philosophy began to take a place in Germany, it has never looked so badly as at the present time — never have emptiness and shallowness overlaid it so completely, and never have they spoken and acted with such arrogance, as though all power were in their hands! To combat the shallowness, to strive with German earnestness and honesty, to draw Philosophy out of the solitude into which it has wandered — to do such work as this we may hope that we are called by the higher spirit of our time. Let us together greet the dawn of a better

time in which the spirit, hitherto a prey to externalities, may return within itself, come to itself again, and win space and room for a kingdom of its own, where true minds will rise above the interests of the moment, and obtain the power to receive the true, eternal and divine, the power to consider and to grasp the highest.

We elders, who in the storms of the age have ripened into men, may think you happy whose youth falls in the day in which you may devote the same undisturbed to Science and to Truth. I have dedicated my life to Science, and it is a true joy to me to find myself again in this place where I may, in a higher measure and more extensive circle, work with others in the interests of the higher sciences, and help to direct your way therein. I hope that I may succeed in deserving and obtaining your confidence. But in the first place, I can ask nothing of you but to bring with you, above all, a trust in science and a trust in yourselves. The love of truth, faith in the power of mind, is the first condition in Philosophy. Man, because he is Mind, should and must deem himself worthy of the highest; he cannot think too highly of the greatness and the power of his mind, and, with this belief, nothing will be so difficult and hard that it will not reveal itself to him. The Being of the universe, at first hidden and concealed, has no power which can offer resistance to the search for knowledge; it has to lay itself open before the seeker — to set before his eyes and give for his enjoyment, its riches and its depths.

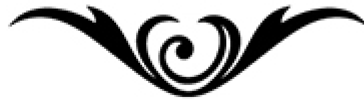
PREFATORY NOTE

IN THE HISTORY of Philosophy the observation is immediately forced upon us that it certainly presents great interest if its subject is regarded from a favourable point of view, but that it would still possess interest even if its end were regarded as opposite to what it is. Indeed, this interest may seem to increase in the degree in which the ordinary conception of Philosophy, and of the end which its history serves, is reversed; for from the History of Philosophy a proof of the futility of the science is mainly derived.

The demand that a history, whatever the subject may be, should state the facts without prejudice and without any particular object or end to be gained by its means, must be regarded as a fair one. But with a commonplace demand like this, we do not get far; for the history of a subject is necessarily intimately connected with the conception which is formed of it. In accordance with this what is important in it is determined, and the relation of the events to the end regulates the selection of facts to be recorded, the mode of comprehending them, and the point of view under which they are regarded. It may happen from the ideas formed of what a State really is, that a reader of the political history of a country may find therein nothing of what he looks for. Still more may this be the case in the history of Philosophy, and representations of this history may be instanced in which everything, excepting what was supposed to be Philosophy, appears to be found.

In other histories we have a clear conception of their subjects, at least so far as their principal points are concerned; we know whether they concern a particular land, people or race, or whether their subject is the science of mathematics, physics, &c., or an art, such as painting. The science of

Philosophy has, however, this distinguishing feature, and, if you will, this disadvantage as compared with other sciences, that we find the most varied points of view as regards its Notion, and regarding that which it ought to and can accomplish. If this first assumption, the conception of the subject of the history, is not established, the history itself is necessarily made vacillating, and it only obtains consistency when it sets forth a definite conception: but then in view of the various ways of regarding its subject, it easily draws upon itself the reproach of one-sidedness.



That drawback relates, however, only to an external consideration of this narrative; there is another and greater disadvantage allied to it. If there are different Notions of the science of Philosophy, it is the true Notion alone that puts us in a position to understand the writings of philosophers who have worked in the knowledge of it. For in thought, and particularly in speculative thought, comprehension means something quite different from understanding the grammatical sense of the words alone, and also from understanding them in the region of ordinary conception only. Hence we may possess a knowledge of the assertions, propositions, or of the opinions of philosophers; we may have occupied ourselves largely with the grounds of and deductions from these opinions, and the main point in all that we have done may be wanting — the comprehension of the propositions. There is hence no lack of voluminous and even learned histories of Philosophy in which the knowledge of the matter itself about which so much ado has been made, is absent. The authors of such histories may be compared to animals which have listened to all the tones in some music, but to whose senses the unison, the harmony of their tones, has not penetrated.

The circumstance mentioned makes it in no science so necessary as in the history of Philosophy to commence with an Introduction, and in it correctly to define, in the first place, the subject of the history about to be

related. For it may be said, How should we begin to treat a subject, the name of which is certainly mentioned often enough, but of whose nature we as yet know nothing? In treating the history of Philosophy thus, we could have no other guidance than that of seeking out and taking up whatever has received the name of Philosophy, anywhere or any time. But in fact, when the Notion of Philosophy is established, not arbitrarily but in a scientific way, such treatment becomes the science of Philosophy itself. For in this science the peculiar characteristic is that its Notion forms the beginning in appearance merely, and it is only the whole treatment of the science that is the proof, and indeed we may say the finding of its Notion; and this is really a result of that treatment.

In this Introduction the Notion of the science of Philosophy, of the subject of its history, has thus likewise to be set forth. At the same time, though this Introduction professes to relate to the history of Philosophy only, what has just been said of Philosophy on the whole, also holds good. What can be said in this Introduction is not so much something which may be stated beforehand, as what can be justified or proved in the treatment of the history. These preparatory explanations are for this reason only, not to be placed in the category of arbitrary assumptions. But to begin with stating what in their justification are really results, can only have the interest which may be possessed by a summary, given in advance, of the most general contents of a science. It must serve to set aside many questions and demands which might, from our ordinary prejudices, arise in such a history.

INTRODUCTION

THERE ARE VARIOUS aspects under which the History of Philosophy may possess interest. We shall find the central point of this interest in the essential connection existing between what is apparently past and the present stage reached by Philosophy. That this connection is not one of the external considerations which may be taken into account in the history of Philosophy, but really expresses its inner character: that the events of this history, while they perpetuate themselves in their effects like all other events, yet produce their results in a special way — this it is which is here to be more clearly expounded.

What the history of Philosophy shows us is a succession of noble minds, a gallery of heroes of thought, who, by the power of Reason, have penetrated into the being of things, of nature and of spirit, into the Being of God, and have won for us by their labours the highest treasure, the treasure of reasoned knowledge.

The events and actions of this history are therefore such that personality and individual character do not enter to any large degree into its content and matter. In this respect the history of Philosophy contrasts with political history, in which the individual, according to the peculiarity of his disposition, talents, affections, the strength or weakness of his character, and in general, according to that through which he is this individual, is the subject of actions and events. In Philosophy, the less deserts and merits are accorded to the particular individual, the better is the history; and the more it deals with thought as free, with the universal character of man as man, the more this thought, which is devoid of special characteristic, is itself shown to be the producing subject.

The acts of thought appear at first to be a matter of history, and, therefore, things of the past, and outside our real existence. But in reality we are what we are through history: or, more accurately, as in the history of Thought, what has passed away is only one side, so in the present, what we have as a permanent possession is essentially bound up with our place in history. The possession of self-conscious reason, which belongs to us of the present world, did not arise suddenly, nor did it grow only from the soil of the present. This possession must be regarded as previously present, as an inheritance, and as the result of labour — the labour of all past generations of men. Just as the arts of outward life, the accumulated skill and invention, the customs and arrangements of social and political life, are the result of the thought, care, and needs, of the want and the misery, of the ingenuity, the plans and achievements of those who preceded us in history, so, likewise, in science, and specially in Philosophy, do we owe what we are to the tradition which, as Herder has put it,[1] like a holy chain, runs through all that was transient, and has therefore passed away. Thus has been preserved and transmitted to us what antiquity produced.

But this tradition is not only a stewardess who simply guards faithfully that which she has received, and thus delivers it unchanged to posterity, just as the course of nature in the infinite change and activity of its forms ever remains constant to its original laws and makes no step in advance. Such tradition is no motionless statue, but is alive, and swells like a mighty river, which increases in size the further it advances from its source. The content of this tradition is that which the intellectual world has brought forth, and the universal Mind does not remain stationary. But it is just the universal Mind with which we have to do. It may certainly be the case with a single nation that its culture, art, science — its intellectual activities as a whole — are at a standstill. This appears, perhaps, to be the case with the Chinese, for example, who may have been as far advanced in every respect two thousand

years ago as now. But the world-spirit does not sink into this rest of indifference; this follows from its very nature, for its activity is its life. This activity presupposes a material already present, on which it acts, and which it does not merely augment by the addition, of new matter, but completely fashions and transforms. Thus that which each generation has produced in science and in intellectual activity, is an heirloom to which all the past generations have added their savings, a temple in which all races of men thankfully and cheerfully deposit that which rendered aid to them through life, and which they had won from the depths of Nature and of Mind. To receive this inheritance is also to enter upon its use. It constitutes the soul of each successive generation, the intellectual substance of the time; its principles, prejudices, and possessions; and this legacy is degraded to a material which becomes metamorphosed by Mind. In this manner that which is received is changed, and the material worked upon is both enriched and preserved at the same time.

This is the function of our own and of every age: to grasp the knowledge which is already existing, to make it our own, and in so doing to develop it still further and to raise it to a higher level. In thus appropriating it to ourselves we make it into something different from what it was before. On the presupposition of an already existing intellectual world which is transformed in our appropriation of it, depends the fact that Philosophy can only arise in connection with previous Philosophy, from which of necessity it has arisen. The course of history does not show us the Becoming of things foreign to us, but the Becoming of ourselves and of our own knowledge.

The ideas and questions which may be present to our mind regarding the character and ends of the history of Philosophy, depend on the nature of the relationship here given. In this lies the explanation of the fact that the study of the history of Philosophy is an introduction to Philosophy itself. The guiding principles for the formation of this history are given in this fact, the

further discussion of which must thus be the main object of this introduction. We must also, however, keep in mind, as being of fundamental importance, the conception of the aim of Philosophy. And since, as already mentioned, the systematic exposition of this conception cannot here find a place, such discussion as we can now undertake, can only propose to deal with the subject provisionally and not to give a thorough and conclusive account of the nature of the Becoming of Philosophy.

This Becoming is not merely a passive movement, as we suppose movements such as those of the sun and moon to be. It is no mere movement in the unresisting medium of space and time. What we must represent to ourselves is the activity of free thought; we have to present the history of the world of thought as it has arisen and produced itself.

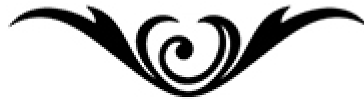
There is an old tradition that it is the faculty of thought which separates men from beasts; and to this tradition we shall adhere. In accordance with this, what man has, as being nobler than a beast, he has through thinking. Everything which is human, however it may appear, is so only because the thought contained in it works and has worked. But thought, although it is thus the essential, substantial, and effectual, has many other elements. We must, however, consider it best when Thought does not pursue anything else, but is occupied only with itself — with what is noblest — when it has sought and found itself. The history which we have before us is the history of Thought finding itself, and it is the case with Thought that it only finds itself in producing itself; indeed, that it only exists and is actual in finding itself. These productions are the philosophic systems; and the series of discoveries on which Thought sets out in order to discover itself, forms a work which has lasted twenty-five hundred years.

If the Thought which is essentially Thought, is in and for itself and eternal, and that which is true is contained in Thought alone, how, then, does this intellectual world come to have a history? In history what appears

is transient, has disappeared in the night of the past and is no more. But true, necessary thought — and it is only with such that we have to do — is capable of no change. The question here raised constitutes one of those matters first to be brought under our consideration. But in the second place, there are also many most important things outside of Philosophy, which are yet the work of Thought, and which are left unconsidered. Such are Religion, Political History, forms of Government, and the Arts and Sciences. The question arises as to how these operations differ from the subject of consideration, and how they are related in history? As regards these two points of view, it is desirable to show in what sense the history of Philosophy is here taken, in order to see clearly what we are about. Moreover, in the third place, we must first take a general survey before we descend to particulars, else the whole is not seen for the mere details — the wood is not seen for the trees, nor Philosophy for mere philosophies. We require to have a general idea of the nature and aim of the whole in order to know what to look for. Just as we first desire to obtain a general idea of a country, which we should no longer see in going into detail, so we desire to see the relation which single philosophies bear to the whole; for in reality, the high value of the detail lies in its relation to the whole. This is nowhere more the case than with Philosophy, and also with its history. In the case of a history, indeed, the establishment of the Universal seems to be less needful than in that of one of the sciences proper. For history seems at first to be a succession of chance events, in which each fact stands isolated by itself, which has Time alone as a connecting-link. But even in political history we are not satisfied with this. We see, or at least divine in it, that essential connection in which the individual events have their place and relation to an end or aim, and in this way obtain significance. For the significant in history is such only through its relation to and connection with

a Universal. To perceive this Universal is thus to apprehend the significance.

There are, therefore, the following points with which I wish to deal in this introduction.



The first of these will be to investigate the character of the history of Philosophy, its significance, its nature, and its aim, from which will follow inferences as to its treatment. In particular, we shall get an insight into the relation of the history of Philosophy to the science of Philosophy, and this will be the most interesting point of all. That is to say, this history represents, not merely the external, accidental, events contained within it, but it shows how the content, or that which appears to belong to mere history, really belongs to the science of Philosophy. The history of Philosophy is itself scientific, and thus essentially becomes the science of Philosophy.

In the second place, the Notion of Philosophy must be more adequately determined, and from it must be deduced what should be excluded from the history of Philosophy out of the infinite material and the manifold aspects of the intellectual culture of the nations. Religion, certainly, and the thoughts contained in and regarding it, particularly when these are in the form of mythology, are, on account of their matter, and the sciences with their ideas on the state, duties and laws, on account of their form, so near Philosophy that the history of the science of Philosophy threatens to become quite indefinite in extent. It might be supposed that the history of Philosophy should take account of all these ideas. Has not everything been called Philosophy and philosophizing? On the one hand, the close connection has to be further considered in which Philosophy stands with its allied subjects, religion, art, the other sciences, and likewise with political history. On the other hand, when the province of Philosophy has been correctly defined, we reach, with the determination of what Philosophy is

and what pertains to it, the starting-point of its history, which must be distinguished from the commencements of religious ideas and mere thoughtful conjectures.

From the idea of the subject which is contained in these first two points of view, it is necessary to pass on to the consideration of the third point, to the general review of this history and to the division of its progress into natural periods — such an arrangement to exhibit it as an organic, progressive whole, as a rational connection through which this history attains the dignity of a science. And I will not occupy further space with reflections on the use of the history of Philosophy, and other methods of treating it. The use is evident. But, in conclusion, I wish to consider the sources of the history of Philosophy, for this is customary.

A THE NOTION OF THE HISTORY OF PHILOSOPHY.

THE THOUGHT WHICH may first occur to us in the history of Philosophy, is that the subject itself contains an inner contradiction. For Philosophy aims at understanding what is unchangeable, eternal, in and for itself: its end is Truth. But history tells us of that which has at one time existed, at another time has vanished, having been expelled by something else. Truth is eternal; it does not fall within the sphere of the transient, and has no history. But if it has a history, and as this history is only the representation of a succession of past forms of knowledge, the truth is not to be found in it, for the truth cannot be what has passed away.

It might be said that all this argument would affect not only the other sciences, but in like degree the Christian religion, and it might be found inconsistent that a history of this religion and of the other sciences should exist; but it would be superfluous further to examine this argument, for it is immediately contradicted by the very fact that there are such histories. But in order to get a better understanding of this apparent contradiction, we must distinguish between the outward history of a religion or a science and the history of the subject itself. And then we must take into account that the history of Philosophy because of the special nature of its subject-matter, is different from other histories. It is at once evident that the contradiction in question could not refer to the outward history, but merely to the inward, or that of the content itself. There is a history of the spread of Christianity and of the lives of those who have avowed it, and its existence has formed itself into that of a Church. This in itself constitutes an external existence such that being brought into contact with temporal affairs of the most diverse kind, its lot is a varied one and it essentially possesses a history. And of the

Christian doctrine it is true that it, too, has its history, but it necessarily soon reached its full development and attained to its appointed powers. And this old creed has been an acknowledged influence to every age, and will still be acknowledged unchanged as the Truth, even though this acknowledgment were become no more than a pretence, and the words an empty form. But the history of this doctrine in its wider sense includes two elements: first the various additions to and deviations from the truth formerly established, and secondly the combating of these errors, the purification of the principles that remain from such additions, and a consequent return to their first simplicity.

The other sciences, including Philosophy, have also an external history like Religion. Philosophy has a history of its origin, diffusion, maturity, decay, revival; a history of its teachers, promoters, and of its opponents — often, too, of an outward relation to religion and occasionally to the State. This side of its history likewise gives occasion to interesting questions. Amongst other such, it is asked why Philosophy, the doctrine of absolute Truth, seems to have revealed itself on the whole to a small number of individuals, to special nations, and how it has limited itself to particular periods of time. Similarly with respect to Christianity, to the Truth in a much more universal form than the philosophical, a difficulty has been encountered in respect to the question whether there is a contradiction in the fact that this religion should have appeared so late in time, and that it should have remained so long and should still remain limited to special races of men. But these and other similar questions are too much a matter of detail to depend merely on the general conflict referred to, and when we have further touched upon the peculiar character of philosophic knowledge, we may go more specially into the aspects which relate to the external existence and external history of Philosophy.

But as regards the comparison between the history of Religion and that of Philosophy as to inner content, there is not in the latter as there is in Religion a fixed and fundamental truth which, as unchangeable, is apart from history. The content of Christianity, which is Truth, has, however, remained unaltered as such, and has therefore little history or as good as none.[2] Hence in Religion, on account of its very nature as Christianity, the conflict referred to disappears. The errors and additions constitute no difficulty. They are transitory and altogether historical in character.

The other sciences, indeed, have also according to their content a History, a part of which relates to alterations, and the renunciation of tenets which were formerly current. But a great, perhaps the greater, part of the history relates to what has proved permanent, so that what was new, was not an alteration on earlier acquisitions, but an addition to them. These sciences progress through a process of juxtaposition. It is true that in Botany, Mineralogy, and so on, much is dependent on what was previously known, but by far the greatest part remains stationary and by means of fresh matter is merely added to without itself being affected by the addition. With a science like Mathematics, history has, in the main, only the pleasing task of recording further additions. Thus to take an example, elementary geometry in so far as it was created by Euclid, may from his time on be regarded as having no further history.

The history of Philosophy, on the other hand, shows neither the motionlessness of a complete, simple content, nor altogether the onward movement of a peaceful addition of new treasures to those already acquired. It seems merely to afford the spectacle of ever-recurring changes in the whole, such as finally are no longer even connected by a common aim.

1. Common Ideas regarding the History of Philosophy.

At this point appear these ordinary superficial ideas regarding the history of Philosophy which have to be referred to and corrected. As regards these very current views, which are doubtless known to you, gentlemen, for indeed they are the reflections most likely to occur in one's first crude thoughts on a history of Philosophy, I will shortly explain what requires explanation, and the explanation of the differences in philosophies will lead us further into the matter itself.

a. *The History of Philosophy as an accumulation of Opinions.*

History, at the first glance, includes in its aim the narration of the accidental circumstances of times, of races, and of individuals, treated impartially partly as regards their relation in time, and partly as to their content. The appearance of contingency in time-succession is to be dealt with later on. It is contingency of content which is the idea with which we have first to deal — the idea of contingent actions. But thoughts and not external actions, or griefs, or joys, form the content of Philosophy. Contingent thoughts, however, are nothing but opinions, and philosophical opinions are opinions relating to the more special content of Philosophy, regarding God, Nature and Spirit.

Thus we now meet the view very usually taken of the history of Philosophy which ascribes to it the narration of a number of philosophical opinions as they have arisen and manifested themselves in time. This kind of matter is in courtesy called opinions; those who think themselves more capable of judging rightly, call such a history a display of senseless follies, or at least of errors made by men engrossed in thought and in mere ideas. This view is not only held by those who recognize their ignorance of Philosophy. Those who do this, acknowledge it, because that ignorance is, in common estimation, held to be no obstacle to giving judgment upon what has to do with the subject; for it is thought that anybody can form a judgment on its character and value without any comprehension, of it

whatever. But the same view is even held by those who write or have written on the history of Philosophy. This history, considered only as the enumeration of various opinions, thus becomes an idle tale, or, if you will, an erudite investigation. For erudition is, in the main, acquaintance with a number of useless things, that is to say, with that which has no intrinsic interest or value further than being known. Yet it is thought that profit is to be derived from learning the various opinions and reflections of other men. It stimulates the powers of thought and also leads to many excellent reflections; this signifies that now and then it occasions an idea, and its art thus consists in the spinning one opinion out of the other.

If the history of Philosophy merely represented various opinions in array, whether they be of God or of natural and spiritual things existent, it would be a most superfluous and tiresome science, no matter what advantage might be brought forward as derived from such thought-activity and learning. What can be more useless than to learn a string of bald opinions, and what more unimportant? Literary works, being histories of Philosophy in the sense that they produce and treat the ideas of Philosophy as if they were opinions, need be only superficially glanced at to find how dry and destitute of interest everything about them is.

An opinion is a subjective conception, an uncontrolled thought, an idea which may occur to me in one direction or in another: an opinion is mine,[3] it is in itself a universal thought which is existent in and for itself. But Philosophy possesses no opinions, for there is no such thing as philosophical opinions. When we hear a man speaking of philosophical opinions, even though he be an historian of philosophy itself, we detect at once this want of fundamental education. Philosophy is the objective science of truth, it is science of necessity, conceiving knowledge, and neither opinion nor the spinning out of opinions.

The more precise significance of this idea is that we get to know opinions only, thus laying emphasis upon the word Opinion. Now the direct opposite of opinion is the Truth; it is Truth before which mere opinion pales. Those who in the history of Philosophy seek mere theories, or who suppose that on the whole only such are to be found within it, also turn aside when that word Truth confronts them. Philosophy here encounters opposition from two different sides. On the one hand piety openly declares Reason or Thought to be incapable of apprehending what is true, and to lead only to the abyss of doubt; it declares that independent thought must be renounced, and reason held in bounds by faith in blind authority, if Truth is to be reached. Of the relation existing between Religion and Philosophy and of its history, we shall deal later on. On the other hand, it is known just as well, that so-called reason has maintained its rights, abandoning faith in mere authority, and has endeavoured to make Christianity rational, so that throughout it is only my personal insight and conviction which obliges me to make any admissions. But this affirmation of the right of reason is turned round in an astonishing manner, so that it results in making knowledge of the truth through reason an impossibility. This so-called reason on the one hand has combated religious faith in the name and power of thinking reason, and at the same time it has itself turned against reason and is true reason's adversary. Instinct and feeling are maintained by it against the true reason, thus making the measure of true value the merely subjective — that is a particular conviction such as each can form in and for himself in his subjective capacity. A personal conviction such as this is no more than the particular opinion that has become final for men.

If we begin with what meets us in our very first conceptions, we cannot neglect to make mention of this aspect in the history of Philosophy. In its results it permeates culture generally, being at once the misconception and true sign of our times. It is the principle through which men mutually

understand and know each other; an hypothesis whose value is established and which is the ground of all the other sciences. In theology it is not so much the creed of the church that passes for Christianity, as that every one to a greater or less degree makes a Christianity of his own to tally with his conviction. And in history we often see theology driven into acquiring the knowledge of various opinions in order that an interest may thus be furnished to the science, and one of the first results of the attention paid them is the honour awarded to all convictions, and the esteem vouchsafed to what has been constituted merely by the individual. The endeavour to know the Truth is then of course relinquished. It is true that personal conviction is the ultimate and absolute essential which reason and its philosophy, from a subjective point of view, demand in knowledge. But there is a distinction between conviction when it rests on subjective grounds such as feelings, speculations and perceptions, or, speaking generally, on the particular nature of the subject, and when it rests on thought proceeding from acquaintance with the Notion and the nature of the thing. In the former case conviction is opinion.

This opposition between mere opinion and truth now sharply defined, we already recognize in the culture of the period of Socrates and Plato — a period of corruption in Greek life — as the Platonic opposition between opinion *δόξα* and Science *ἐπιστήμη*. It is the same opposition as that which existed in the decadence of Roman public and political life under Augustus, and subsequently when Epicureanism and indifference set themselves up against Philosophy. Under this influence, when Christ said, "I came into the world that I should bear witness unto the Truth," Pilate answered, "What is Truth?" That was said in a superior way, and signifies that this idea of truth is an expedient which is obsolete: we have got further, we know that there is no longer any question about knowing the Truth, seeing that we have gone beyond it. Who makes this statement has gone beyond it indeed. If this is

made our starting point in the history of Philosophy, its whole significance will consist in finding out the particular ideas of others, each one of which is different from the other: these individual points of view are thus foreign to me: my thinking reason is not free, nor is it present in them: for me they are but extraneous, dead historic matter, or so much empty content, and to satisfy oneself with empty vanity is mere subjective vanity itself.

To the impartial man, the Truth has always been a heart-stirring word and one of great import. As to the assertion that the Truth cannot be known, we shall consider it more closely in the history of Philosophy itself where it appears. The only thing to be here remarked is that if this assumption be allowed, as was the case with Tennemann, it is beyond conception why anyone should still trouble about Philosophy, since each opinion asserts falsely in its turn that it has found the truth. This immediately recalls to me the old belief that Truth consists in knowledge, but that an individual only knows the Truth in so far as he reflects and not as he walks and stands: and that the Truth cannot be known in immediate apprehension and perception, whether it be external and sensuous, or whether it be intellectual perception (for every perception as a perception is sensuous) but only through the labour of thought.

b. *Proof of the futility of Philosophical Knowledge obtained through the History of Philosophy itself.*

From another point of view another consequence ensues from the above conception of the history of Philosophy which may at will be looked at as an evil or a benefit. In view of such manifold opinions and philosophical systems so numerous, one is perplexed to know which one ought to be accepted. In regard to the great matters to which man is attracted and a knowledge of which Philosophy would bestow, it is evident that the greatest minds have erred, because they have been contradicted by others. "Since this has been so with minds so great, how then can *ego homuncio* attempt to

form a judgment?” This consequence, which ensues from the diversity in philosophical systems, is, as may be supposed, the evil in the matter, while at the same time it is a subjective good. For this diversity is the usual plea urged by those who, with an air of knowledge, wish to make a show of interest in Philosophy, to explain the fact that they, with this pretence of good-will, and, indeed, with added motive for working at the science, do in fact utterly neglect it. But this diversity in philosophical systems is far from being merely an evasive plea. It has far more weight as a genuine serious ground of argument against the zeal which Philosophy requires. It justifies its neglect and demonstrates conclusively the powerlessness of the endeavour to attain to philosophic knowledge of the truth. When it is admitted that Philosophy ought to be a real science, and one Philosophy must certainly be the true, the question arises as to which Philosophy it is, and when it can be known. Each one asserts its genuineness, each even gives different signs and tokens by which the Truth can be discovered; sober reflective thought must therefore hesitate to give its judgment.

This, then, is the wider interest which the history of Philosophy is said to afford. Cicero (De natura Deorum I. 8 sq.) gives us from this point of view, a most slovenly history of philosophic thought on God. He puts it in the mouth of an Epicurean, but he himself knew of nothing more favourable to say, and it is thus his own view. The Epicurean says that no certain knowledge has been arrived at. The proof that the efforts of philosophy are futile is derived directly from the usual superficial view taken of its history; the results attendant on that history make it appear to be a process in which the most various thoughts arise in numerous philosophies, each of which opposes, contradicts and refutes the other. This fact, which cannot be denied, seems to contain the justification, indeed the necessity for applying to Philosophy the words of Christ, “Let the dead bury their dead; arise, and follow Me.” The whole of the history of Philosophy becomes a battlefield

covered with the bones of the dead; it is a kingdom not merely formed of dead and lifeless individuals, but of refuted and spiritually dead systems, since each has killed and buried the other. Instead of "Follow thou Me," here then it must indeed be said, "Follow thine own self" — that is, hold by thine own convictions, remain steadfast to thine own opinion, why adopt another?

It certainly happens that a new philosophy makes its appearance, which maintains the others to be valueless; and indeed each one in turn comes forth at first with the pretext that by its means all previous philosophies not only are refuted, but what in them is wanting is supplied, and now at length the right one is discovered. But following upon what has gone before, it would rather seem that other words of Scripture are just as applicable to such a philosophy — the words which the Apostle Peter spoke to Ananias, "Behold the feet of them that shall carry thee out are at the door." Behold the philosophy by which thine own will be refuted and displaced shall not tarry long as it has not tarried before.

c. *Explanatory remarks on the diversity in Philosophies.*

Certainly the fact is sufficiently well established that there are and have been different philosophies. The Truth is, however, one; and the instinct of reason maintains this irradicable intuition or belief. It is said that only one philosophy can be true, and, because philosophies are different, it is concluded that all others must be erroneous. But, in fact, each one in turn gives every assurance, evidence and proof of being the one and true Philosophy. This is a common mode of reasoning and is what seems in truth to be the view of sober thought. As regards the sober nature of the word at issue — thought — we can tell from every-day experience that if we fast we feel hunger either at once or very soon. But sober thought always has the fortunate power of not resulting in hunger and desire, but of being and remaining as it is, content. Hence the thought expressed in such an utterance

reveals the fact that it is dead understanding; for it is only death which fasts and yet rests satisfied. But neither physical life nor intellectual remains content with mere abstention; as desire it presses on through hunger and through thirst towards Truth, towards knowledge itself. It presses on to satisfy this desire and does not allow itself to feast and find sufficiency in a reflection such as this.

As to this reflection, the next thing to be said of it is that however different the philosophies have been, they had a common bond in that they were Philosophy. Thus whoever may have studied or become acquainted with a philosophy, of whatever kind, provided only that it is such, has thereby become acquainted with Philosophy. That delusive mode of reasoning which regards diversity alone, and from doubt of or aversion to the particular form in which a Universal finds its actuality, will not grasp or even allow this universal nature, I have elsewhere[4] likened to an invalid recommended by the doctor to eat fruit, and who has cherries, plums or grapes, before him, but who pedantically refuses to take anything because no part of what is offered him is fruit, some of it being cherries, and the rest plums or grapes.

But it is really important to have a deeper insight into the bearings of this diversity in the systems of Philosophy. Truth and Philosophy known philosophically, make such diversity appear in another light from that of abstract opposition between Truth and Error. The explanation of how this comes about will reveal to us the significance of the whole history of Philosophy. We must make the fact conceivable, that the diversity and number of philosophies not only does not prejudice Philosophy itself, that is to say the possibility of a philosophy, but that such diversity is, and has been, absolutely necessary to the existence of a science of Philosophy and that it is essential to it.

This makes it easy to us to comprehend the aim of Philosophy, which is in thought and in conception to grasp the Truth, and not merely to discover that nothing can be known, or that at least temporal, finite truth, which also is an untruth, can alone be known and not the Truth indeed. Further we find that in the history of Philosophy we have to deal with Philosophy itself. The facts within that history are not adventures and contain no more romance than does the history of the world. They are not a mere collection of chance events, of expeditions of wandering knights, each going about fighting, struggling purposelessly, leaving no results to show for all his efforts. Nor is it so that one thing has been thought out here, another there, at will; in the activity of thinking mind there is real connection, and what there takes place is rational. It is with this belief in the spirit of the world that we must proceed to history, and in particular to the history of Philosophy.

2. Explanatory Remarks upon the Definition of the History of Philosophy.

The above statement, that the Truth is only one, is still abstract and formal. In the deeper sense it is our starting point. But the aim of Philosophy is to know this one Truth as the immediate source from which all else proceeds, both all the laws of nature and all the manifestations of life and consciousness of which they are mere reflections, or to lead these laws and manifestations in ways apparently contrary, back to that single source, and from that source to comprehend them, which is to understand their derivation. Thus what is most essential is to know that the single truth is not merely a solitary, empty thought, but one determined within itself. To obtain this knowledge we must enter into some abstract Notions which, as such, are quite general and dry, and which are the two principles of *Development* and of the *Concrete*. We could, indeed, embrace the whole in the single principle of development; if this were clear, all else would result and follow of its own accord. The product of thinking is the thought; thought is,

however, still formal; somewhat more defined it becomes Notion, and finally Idea is Thought in its totality, implicitly and explicitly determined. Thus the Idea, and it alone is Truth. Now it is essentially in the nature of the Idea to develop, and only through development to arrive at comprehension of itself, or to become what it is. That the Idea should have to make itself what it is, seems like a contradiction; it may be said that it is what it is.

a. *The Notion of Development.*

The idea of development is well known, but it is the special characteristic of Philosophy to investigate such matters as were formerly held as known. What is dealt with or made use of without consideration as an aid to daily life, is certainly the unknown to man unless he be informed in Philosophy. The further discussion of this idea belongs to the science of Logic.

In order to comprehend what development is, what may be called two different states must be distinguished. The first is what is known as capacity, power, what I call being-in-itself (*potentia*, *δύναμις*); the second principle is that of being-for-itself, actuality (*actus*, *ἐνέργεια*). If we say, for example, that man is by nature rational, we would mean that he has reason only inherently or in embryo: in this sense, reason, understanding, imagination, will, are possessed from birth or even from the mother's womb. But while the child only has capacities or the actual possibility of reason, it is just the same as if he had no reason; reason does not yet exist in him since he cannot yet do anything rational, and has no rational consciousness. Thus what man is at first implicitly becomes explicit, and it is the same with reason. If, then, man has actuality on whatever side, he is actually rational; and now we come to reason.

What is the real meaning of this word? That which is in itself must become an object to mankind, must arrive at consciousness, thus becoming for man. What has become an object to him is the same as what he is in

himself; through the becoming objective of this implicit being, man first becomes for himself; he is made double, is retained and not changed into another. For example, man is thinking, and thus he thinks out thoughts. In this way it is in thought alone that thought is object; reason produces what is rational: reason is its own object. The fact that thought may also descend to what is destitute of reason is a consideration involving wider issues, which do not concern us here. But even though man, who in himself is rational, does not at first seem to have got further on since he became rational for himself — what is implicit having merely retained itself — the difference is quite enormous: no new content has been produced, and yet this form of being for self makes all the difference. The whole variation in the development of the world in history is founded on this difference. This alone explains how since all mankind is naturally rational, and freedom is the hypothesis on which this reason rests, slavery yet has been, and in part still is, maintained by many peoples, and men have remained contented under it. The only distinction between the Africans and the Asiatics on the one hand, and the Greeks, Romans, and moderns on the other, is that the latter know and it is explicit for them, that they are free, but the others are so without knowing that they are, and thus without existing as being free. This constitutes the enormous difference in their condition. All knowledge, and learning, science, and even commerce have no other object than to draw out what is inward or implicit and thus to become objective.

Because that which is implicit comes into existence, it certainly passes into change, yet it remains one and the same, for the whole process is dominated by it. The plant, for example, does not lose itself in mere indefinite change. From the germ much is produced when at first nothing was to be seen; but the whole of what is brought forth, if not developed, is yet hidden and ideally contained within itself. The principle of this projection into existence is that the germ cannot remain merely implicit, but

is impelled towards development, since it presents the contradiction of being only implicit and yet not desiring so to be. But this coming without itself has an end in view; its completion fully reached, and its previously determined end is the fruit or produce of the germ, which causes a return to the first condition. The germ will produce itself alone and manifest what is contained in it, so that it then may return to itself once more thus to renew the unity from which it started. With nature it certainly is true that the subject which commenced and the matter which forms the end are two separate units, as in the case of seed and fruit. The doubling process has apparently the effect of separating into two things that which in content is the same. Thus in animal life the parent and the young are different individuals although their nature is the same.

In Mind it is otherwise: it is consciousness and therefore it is free, uniting in itself the beginning and the end. As with the germ in nature, Mind indeed resolves itself back into unity after constituting itself another. But what is in itself becomes for Mind and thus arrives at being for itself. The fruit and seed newly contained within it on the other hand, do not become for the original germ, but for us alone; in the case of Mind both factors not only are implicitly the same in character, but there is a being for the other and at the same time a being for self. That for which the "other" is, is the same as that "other;" and thus alone Mind is at home with itself in its "other." The development of Mind lies in the fact that its going forth and separation constitutes its coming to itself.

This being-at-home-with-self, or coming-to-self of Mind may be described as its complete and highest end: it is this alone that it desires and nothing else. Everything that from eternity has happened in heaven and earth, the life of God and all the deeds of time simply are the struggles for Mind to know itself, to make itself objective to itself, to find itself, be for itself, and finally unite itself to itself; it is alienated and divided, but only so

as to be able thus to find itself and return to itself. Only in this manner does Mind attain its freedom, for that is free which is not connected with or dependent on another. True self-possession and satisfaction are only to be found in this, and in nothing else but Thought does Mind attain this freedom. In sense-perception, for instance, and in feeling, I find myself confined and am not free; but I am free when I have a consciousness of this my feeling. Man has particular ends and interests even in will; I am free indeed when this is mine. Such ends, however, always contain "another," or something which constitutes for me "another," such as desire and impulse. It is in Thought alone that all foreign matter disappears from view, and that Mind is absolutely free. All interest which is contained in the Idea and in Philosophy is expressed in it.

b. *The Notion of the Concrete.*

As to development, it may be asked, what does develop and what forms the absolute content? Development is considered in the light of a formal process in action and as destitute of content. But the act has no other end but activity, and through this activity the general character of the content is already fixed. For being-in-self and being-for-self are the moments present in action; but the act is the retention of these diverse elements within itself. The act thus is really one, and it is just this unity of differences which is the concrete. Not only is the act concrete, but also the implicit, which stands to action in the relation of subject which begins, and finally the product is just as concrete as the action or as the subject which begins. Development in process likewise forms the content, the Idea itself; for this we must have the one element and then the other: both combined will form a unity as third, because the one in the other is at home with, and not without, itself. Thus the Idea is in its content concrete within itself, and this in two ways: first it is concrete potentially, and then it is its interest that what is in itself should be there for it.

It is a common prejudice that the science of Philosophy deals only with abstractions and empty generalities, and that sense-perception, our empirical self-consciousness, natural instinct, and the feelings of every-day life, lie, on the contrary, in the region of the concrete and the self-determined. As a matter of fact, Philosophy is in the region of thought, and has therefore to deal with universals; its content is abstract, but only as to form and element. In itself the Idea is really concrete, for it is the union of the different determinations. It is here that reasoned knowledge differs from mere knowledge of the understanding, and it is the business of Philosophy, as opposed to understanding, to show that the Truth or the Idea does not consist in empty generalities, but in a universal; and that is within itself the particular and the determined. If the Truth is abstract it must be untrue. Healthy human reason goes out towards what is concrete; the reflection of the understanding comes first as abstract and untrue, correct in theory only, and amongst other things unpractical. Philosophy is what is most antagonistic to abstraction, and it leads back to the concrete.

If we unite the Notion of the concrete with that of development we have the motion of the concrete. Since the implicit is already concrete within itself, and we only set forth what is implicitly there, the new form which now looks different and which was formerly shut up in the original unity, is merely distinguished. The concrete must become for itself or explicit; as implicit or potential it is only differentiated within itself, not as yet explicitly set forth, but still in a state of unity. The concrete is thus simple, and yet at the same time differentiated. This, its inward contradiction, which is indeed the impelling force in development, brings distinction into being. But thus, too, its right to be taken back and reinstated extends beyond the difference; for its truth is only to be found in unity. Life, both that which is in Nature and that which is of the Idea, of Mind within itself, is thus manifested. Were the Idea abstract, it would simply be the highest

conceivable existence, and that would be all that could be said of it; but such a God is the product of the understanding of modern times. What is true is rather found in motion, in a process, however, in which there is rest; difference, while it lasts, is but a temporary condition, through which comes unity, full and concrete.

We may now proceed to give examples of sensuous things, which will help us further to explain this Notion of the concrete. Although the flower has many qualities, such as smell, taste, form, colour, &c., yet it is one. None of these qualities could be absent in the particular leaf or flower: each individual part of the leaf shares alike all the qualities of the leaf entire. Gold, similarly contains in every particle all its qualities unseparated and entire. It is frequently allowed with sensuous things that such varied elements may be joined together, but, in the spiritual, differentiation is supposed to involve opposition. We do not controvert the fact, or think it contradictory, that the smell and taste of the flower, although otherwise opposed, are yet clearly in one subject; nor do we place the one against the other. But the understanding and understanding thought find everything of a different kind, placed in conjunction, to be incompatible. Matter, for example, is complex and coherent, or space is continuous and uninterrupted. Likewise we may take separate points in space and break up matter dividing it ever further into infinity. It then is said that matter consists of atoms and points, and hence is not continuous. Therefore we have here the two determinations of continuity and of definite points, which understanding regards as mutually exclusive, combined in one. It is said that matter must be clearly either continuous or divisible into points, but in reality it has both these qualities. Or when we say of the mind of man that it has freedom, the understanding at once brings up the other quality, which in this case is necessity, saying, that if Mind is free it is not in subjection to necessity, and, inversely, if its will and thought are determined through

necessity, it is not free — the one, they say, excludes the other. The distinctions here are regarded as exclusive, and not as forming something concrete. But that which is true, the Mind, is concrete, and its attributes are freedom and necessity. Similarly the higher point of view is that Mind is free in its necessity, and finds its freedom in it alone, since its necessity rests on its freedom. But it is more difficult for us to show the unity here than in the case of natural objects. Freedom can, however, be also abstract freedom without necessity, which false freedom is self-will, and for that reason it is self-opposed, unconsciously limited, an imaginary freedom which is free in form alone.

The fruit of development, which comes third, is a result of motion, but inasmuch as it is merely the result of one stage in development, as being last in this stage, it is both the starting point and the first in order in another such stage. Goethe somewhere truly says, "That which is formed ever resolves itself back into its elements." Matter — which as developed has form — constitutes once more the material for a new form. Mind again takes as its object and applies its activity to the Notion in which in going within itself, it has comprehended itself, which it is in form and being, and which has just been separated from it anew. The application of thought to this, supplies it with the form and determination of thought. This action thus further forms the previously formed, gives it additional determinations, makes it more determinate in itself, further developed and more profound. As concrete, this activity is a succession of processes in development which must be represented not as a straight line drawn out into vague infinity, but as a circle returning within itself, which, as periphery, has very many circles, and whose whole is a large number of processes in development turning back within themselves.

c. *Philosophy as the apprehension of the development of the Concrete.*

Having thus generally explained the nature of the Concrete, I now add as regards its import, that the Truth thus determined within itself is impelled towards development. It is only the living and spiritual which internally bestirs and develops itself. Thus the Idea as concrete in itself, and self-developing, is an organic system and a totality which contains a multitude of stages and of moments in development. Philosophy has now become for itself the apprehension of this development, and as conceiving Thought, is itself this development in Thought. The more progress made in this development, the more perfect is the Philosophy.

This development goes no further out than into externality, but the going without itself of development also is a going inwards. That is to say, the universal Idea continues to remain at the foundation and still is the all-embracing and unchangeable. While in Philosophy the going out of the Idea in course of its development is not a change, a becoming "another," but really is a going within itself, a self-immersion, the progress forward makes the Idea which was previously general and undetermined, determined within itself. Further development of the Idea or its further determination is the same thing exactly. Depth seems to signify intensiveness, but in this case the most extensive is also the most intensive. The more intensive is the Mind, the more extensive is it, hence the larger is its embrace. Extension as development, is not dispersion or falling asunder, but a uniting bond which is the more powerful and intense as the expanse of that embraced is greater in extent and richer. In such a case what is greater is the strength of opposition and of separation; and the greater power overcomes the greater separation.

These are the abstract propositions regarding the nature of the Idea and of its development, and thus within it Philosophy in its developed state is constituted: it is one Idea in its totality and in all its individual parts, like

one life in a living being, one pulse throbs throughout all its members. All the parts represented in it, and their systematization, emanate from the one Idea; all these particulars are but the mirrors and copies of this one life, and have their actuality only in this unity. Their differences and their various qualities are only the expression of the Idea and the form contained within it. Thus the Idea is the central point, which is also the periphery, the source of light, which in all its expansion does not come without itself, but remains present and immanent within itself. Thus it is both the system of necessity and its own necessity, which also constitutes its freedom.

3. Results obtained with respect to the Notion of the History of Philosophy.

Thus we see that Philosophy is system in development; the history of Philosophy is the same; and this is the main point to be noted and the first principle to be dealt with in this treatise on that history. In order to make this evident, the difference in respect to the possible modes of manifestation must first be pointed out. That is to say, the progression of the various stages in the advance of Thought may occur with the consciousness of necessity, in which case each in succession deduces itself, and this form and this determination can alone emerge. Or else it may come about without this consciousness as does a natural and apparently accidental process, so that while inwardly, indeed, the Notion brings about its result consistently, this consistency is not made manifest. This is so in nature; in the various stages of the development of twigs, leaves, blossom and fruit, each proceeds for itself, but the inward Idea is the directing and determining force which governs the progression. This is also so with the child whose bodily powers, and above all whose intellectual activities, make their appearance one after the other, simply and naturally, so that those parents who form such an experience for the first time, marvel whence all that is now showing itself

from within, comes from; for the whole of these manifestations merely have the form of a succession in time.

The one kind of progression which represents the deduction of the forms, the necessity thought out and recognized, of the determinations, is the business of Philosophy; and because it is the pure Idea which is in question and not yet its mere particularized form as Nature and as Mind, that representation is, in the main, the business of logical Philosophy. But the other method, which represents the part played by the history of Philosophy, shows the different stages and moments in development in time, in manner of occurrence, in particular places, in particular people or political circumstances, the complications arising thus, and, in short, it shows us the empirical form. This point of view is the only one worthy of this science. From the very nature of the subject it is inherently the true one, and through the study of this history it will be made manifest that it actually shows and proves itself so.

Now in reference to this Idea, I maintain that the sequence in the systems of Philosophy in History is similar to the sequence in the logical deduction of the Notion-determinations in the Idea. I maintain that if the fundamental conceptions of the systems appearing in the history of Philosophy be entirely divested of what regards their outward form, their relation to the particular and the like, the various stages in the determination of the Idea are found in their logical Notion. Conversely in the logical progression taken for itself, there is, so far as its principal elements are concerned, the progression of historical manifestations; but it is necessary to have these pure Notions in order to know what the historical form contains. It may be thought that Philosophy must have another order as to the stages in the Idea than that in which these Notions have gone forth in time; but in the main the order is the same. This succession undoubtedly separates itself, on the one hand, into the sequence in time of History, and on the other into succession

in the order of ideas. But to treat more fully of this last would divert us too far from our aim.

I would only remark this, that what has been said reveals that the study of the history of Philosophy is the study of Philosophy itself, for, indeed, it can be nothing else. Whoever studies the history of sciences such as Physics and Mathematics, makes himself acquainted with Physics and Mathematics themselves. But in order to obtain a knowledge of its progress as the development of the Idea in the empirical, external form in which Philosophy appears in History, a corresponding knowledge of the Idea is absolutely essential, just as in judging of human affairs one must have a conception of that which is right and fitting. Else, indeed, as in so many histories of Philosophy, there is presented to the vision devoid of idea, only a disarranged collection of opinions. To make you acquainted with this Idea, and consequently to explain the manifestations, is the business of the history of Philosophy, and to do this is my object in undertaking to lecture on the subject. Since the observer must bring with him the Notion of the subject in order to see it in its phenomenal aspect and in order to expose the object faithfully to view, we need not wonder at there being so many dull histories of Philosophy in which the succession of its systems are represented simply as a number of opinions, errors and freaks of thought. They are freaks of thought which, indeed, have been devised with a great pretension of acuteness and of mental exertion, and with everything else which can be said in admiration of what is merely formal. But, considering the absence of philosophic mind in such historians as these, how should they be able to comprehend and represent the content, which is reasoned thought?

It is shown from what has been said regarding the formal nature of the Idea, that only a history of Philosophy thus regarded as a system of development in Idea, is entitled to the name of Science: a collection of facts

constitutes no science. Only thus as a succession of phenomena established through reason, and having as content just what is reason and revealing it, does this history show that it is rational: it shows that the events recorded are in reason. How should the whole of what has taken place in reason not itself be rational? That faith must surely be the more reasonable in which chance is not made ruler over human affairs, and it is the business of Philosophy to recognize that however much its own manifestations may be history likewise, it is yet determined through the Idea alone.

Through these general preliminary conceptions the categories are now determined, the more immediate application of which to the history of Philosophy we have now to consider. This application will bring before us the most significant aspects in this history.

a. *The development in Time of the various Philosophies.*

The first question which may be asked in reference to this history, concerns that distinction in regard to the manifestation of the Idea, which has just been noticed. It is the question as to how it happens that Philosophy appears to be a development in time and has a history. The answer to this question encroaches on the metaphysics of Time, and it would be a digression from our object to give here more than the elements on which the answer rests.

It has been shown above in reference to the existence of Mind, that its Being is its activity. Nature, on the contrary, is, as it is; its changes are thus only repetitions, and its movements take the form of a circle merely. To express this better, the activity of Mind is to know itself. I am, immediately, but this I am only as a living organism; as Mind I am only in so far as I know myself. *Γνῶθι σεαυτόν*, Know thyself, the inscription over the temple of the oracle at Delphi, is the absolute command which is expressed by Mind in its essential character. But consciousness really implies that for

myself, I am object to myself. In forming this absolute division between what is mine and myself, Mind constitutes its existence and establishes itself as external to itself. It postulates itself in the externality which is just the universal and the distinctive form of existence in Nature. But one of the forms of externality is Time, and this form requires to be further examined both in the Philosophy of Nature and the finite Mind.

This Being in existence and therefore Being in time is a moment not only of the individual consciousness, which as such is essentially finite, but also of the development of the philosophical Idea in the element of Thought. For the Idea, thought of as being at rest, is, indeed, not in Time. To think of it as at rest, and to preserve it in the form of immediacy is equivalent to its inward perception. But the Idea as concrete, is, as has been shown, the unity of differences; it is not really rest, and its existence is not really sense-perception, but as differentiation within itself and therefore as development, it comes into existent Being and into externality in the element of Thought, and thus pure Philosophy appears in thought as a progressive existence in time. But this element of Thought is itself abstract and is the activity of a single consciousness. Mind is, however, not only to be considered as individual, finite consciousness, but as that Mind which is universal and concrete within itself; this concrete universality, however, comprehends all the various sides and modes evolved in which it is and becomes object to the Idea. Thus Mind's thinking comprehension of self is at the same time the progression of the total actuality evolved. This progression is not one which takes its course through the thought of an individual and exhibits itself in a single consciousness, for it shows itself to be universal Mind presenting itself in the history of the world in all the richness of its form. The result of this development is that one form, one stage in the Idea comes to consciousness in one particular race, so that this race and this time expresses only this particular form, within which it constructs its universe

and works out its conditions. The higher stage, on the other hand, centuries later reveals itself in another race of people.

Now if we thus grasp the principles of the Concrete and of Development, the nature of the manifold obtains quite another signification, and what is said of the diversity in philosophies as if the manifold were fixed and stationary and composed of what is mutually exclusive, is at once refuted and relegated to its proper place. Such talk is that in which those who despise Philosophy think they possess an invincible weapon against it, and in their truly beggarly pride in their pitiful representations of it, they are in perfect ignorance even of what they have and what they have to know in any meagre ideas attained, such as in that of the manifold and diverse. Yet this category is one which anybody can understand; no difficulty is made in regard to it, for it is thoroughly known, and those who use it think they can do so as being entirely comprehensible — as a matter of course they understand what it is. But those who believe the principle of diversity to be one absolutely fixed, do not know its nature, or its dialectic; the manifold or diverse is in a state of flux; it must really be conceived of as in the process of development, and as but a passing moment. Philosophy in its concrete Idea is the activity of development in revealing the differences which it contains within itself; these differences are thoughts, for we are now speaking of development in Thought. In the first place, the differences which rest in the Idea are manifested as thoughts. Secondly, these distinctions must come into existence, one here and the other there; and in order that they may do this, they must be complete, that is, they must contain within themselves the Idea in its totality. The concrete alone as including and supporting the distinctions, is the actual; it is thus, and thus alone, that the differences are in their form entire.

A complete form of thought such as is here presented, is a Philosophy. But the Idea contains the distinctions in a peculiar form. It may be said that

the form is indifferent, and that the content, the Idea, is the main consideration; and people think themselves quite moderate and reasonable when they state that the different philosophies all contain the Idea, though in different forms, understanding by this that these forms are contingent. But everything hangs on this: these forms are nothing else than the original distinctions in the Idea itself, which is what it is only in them. They are in this way essential to, and constitute the content of the Idea, which in thus sundering itself, attains to form. The manifold character of the principles which appear, is, however, not accidental, but necessary: the different forms constitute an integral part of the whole form. They are the determinations of the original Idea, which together constitute the whole; but as being outside of one another, their union does not take place in them, but in us, the observers. Each system is determined as one, but it is not a permanent condition that the differences are thus mutually exclusive. The inevitable fate of these determinations must follow, and that is that they shall be drawn together and reduced to elements or moments. The independent attitude taken up by each moment is again laid aside. After expansion, contraction follows — the unity out of which they first emerged. This third may itself be but the beginning of a further development. It may seem as if this progression were to go on into infinitude, but it has an absolute end in view, which we shall know better later on; many turnings are necessary, however, before Mind frees itself in coming to consciousness.

The temple of self-conscious reason is to be considered from this the point of view alone worthy of the history of Philosophy. It is hence rationally built by an inward master worker, and not in Solomon's method, as freemasons build. The great assumption that what has taken place on this side, in the world, has also done so in conformity with reason — which is what first gives the history of Philosophy its true interest — is nothing else than trust in Providence, only in another form. As the best of what is in the

world is that which Thought produces, it is unreasonable to believe that reason only is in Nature, and not in Mind. That man who believes that what, like the philosophies, belongs to the region of mind must be merely contingent, is insincere in his belief in divine rule, and what he says of it is but empty talk.

A long time is undoubtedly required by Mind in working out Philosophy, and when one first reflects on it, the length of the time may seem astonishing, like the immensity of the space spoken of in astronomy. But it must be considered in regard to the slow progress of the world-spirit, that there is no need for it to hasten:— "A thousand years are in Thy sight as one day." It has time enough just because it is itself outside of time, because it is eternal. The fleeting events of the day pass so quickly that there is not time enough for all that has to be done. Who is there who does not die before he has achieved his aims? The world-spirit has time enough, but that is not all. It is not time alone which has to be made use of in the acquisition of a conception; much else is required. The fact that so many races and generations are devoted to these operations of its consciousness by Mind, and that the appearance is so perpetually presented of rising up and passing away, concern it not at all; it is rich enough for such displays, it pursues its work on the largest possible scale, and has nations and individuals enough and to spare. The saying that Nature arrives at its end in the shortest possible way, and that this is right, is a trivial one. The way shown by mind is indirect, and accommodates itself to circumstances. Considerations of finite life, such as time, trouble, and cost, have no place here. We ought, too, to feel no disappointment that particular kinds of knowledge cannot yet be attained, or that this or that is still absent. In the history of the world progression is slow.

b. *The application of the foregoing to the treatment of Philosophy.*

The first result which follows from what has been said, is that the whole of the history of Philosophy is a progression impelled by an inherent necessity, and one which is implicitly rational and *à priori* determined through its Idea; and this the history of Philosophy has to exemplify. Contingency must vanish on the appearance of Philosophy. Its history is just as absolutely determined as the development of Notions, and the impelling force is the inner dialectic of the forms. The finite is not true, nor is it what it is to be — its determinate nature is bound up with its existence. But the inward Idea abolishes these finite forms: a philosophy which has not the absolute form identical with the content, must pass away because its form is not that of truth.

What follows, secondly from what we have said, is that every philosophy has been and still is necessary. Thus none have passed away, but all are affirmatively contained as elements in a whole. But we must distinguish between the particular principle of these philosophies as particular, and the realization of this principle throughout the whole compass of the world. The principles are retained, the most recent philosophy being the result of all preceding, and hence no philosophy has ever been refuted. What has been refuted is not the principle of this philosophy, but merely the fact that this principle should be considered final and absolute in character. The atomic philosophy, for example, has arrived at the affirmation that the atom is the absolute existence, that it is the indivisible unit which is also the individual or subject; seeing, then, that the bare unit also is the abstract being-for-self, the Absolute would be grasped as infinitely many units. The atomic theory has been refuted, and we are atomists no longer. Mind is certainly explicitly existent as a unit or atom, but that is to attribute to it a barren character and qualities incapable of expressing anything of its depth. The principle is indeed retained, although it is not the absolute in its entirety. This same contradiction appears in all development. The development of the tree is the

negation of the germ, and the blossom that of the leaves, in so far as that they show that these do not form the highest and truest existence of the tree. Last of all, the blossom finds its negation in the fruit. Yet none of them can come into actual existence excepting as preceded by all the earlier stages. Our attitude to a philosophy must thus contain an affirmative side and a negative; when we take both of these into consideration, we do justice to a philosophy for the first time. We get to know the affirmative side later on both in life and in science; thus we find it easier to refute than to justify.

In the third place, we shall limit ourselves to the particular consideration of the principle itself. Each principle has reigned for a certain time, and when the whole system of the world has been explained from this special form, it is called a philosophical system. Its whole theory has certainly to be learned, but as long as the principle is abstract it is not sufficient to embrace the forms belonging to our conception of the world. The Cartesian principles, for instance, are very suitable for application to mechanism, but for nothing further; their representation of other manifestations in the world, such as those of vegetable and animal nature, are insufficient, and hence uninteresting. Therefore we take into consideration the principles of these philosophies only, but in dealing with concrete philosophies we must also regard the chief forms of their development and their applications. The subordinate philosophies are inconsistent; they have had bright glimpses of the truth, which are, however, independent of their principles. This is exemplified in the Timæus of Plato, a philosophy of nature, the working out of which is empirically very barren because its principle does not as yet extend far enough, and it is not to its principle that we owe the deep gleams of thought there contained.

In the fourth place it follows that we must not regard the history of Philosophy as dealing with the past, even though it is history. The scientific products of reason form the content of this history, and these are not past.

What is obtained in this field of labour is the True, and, as such, the Eternal; it is not what exists now, and not then; it is true not only to-day or to-morrow, but beyond all time, and in as far as it is in time, it is true always and for every time. The bodily forms of those great minds who are the heroes of this history, the temporal existence and outward lives of the philosophers, are, indeed, no more, but their works and thoughts have not followed suit, for they neither conceived nor dreamt of the rational import of their works. Philosophy is not somnambulism, but is developed consciousness; and what these heroes have done is to bring that which is implicitly rational out of the depths of Mind, where it is found at first as substance only, or as inwardly existent, into the light of day, and to advance it into consciousness and knowledge. This forms a continuous awakening. Such work is not only deposited in the temple of Memory as forms of times gone by, but is just as present and as living now as at the time of its production. The effects produced and work performed are not again destroyed or interrupted by what succeeds, for they are such that we must ourselves be present in them. They have as medium neither canvas, paper, marble, nor representation or memorial to preserve them. These mediums are themselves transient, or else form a basis for what is such. But they do have Thought, Notion, and the eternal Being of Mind, which moths cannot corrupt, nor thieves break through and steal. The conquests made by Thought when constituted into Thought form the very Being of Mind. Such knowledge is thus not learning merely, or a knowledge of what is dead, buried and corrupt: the history of Philosophy has not to do with what is gone, but with the living present.

c. *Further comparison between the History of Philosophy and Philosophy itself.*

We may appropriate to ourselves the whole of the riches apportioned out in time: it must be shown from the succession in philosophies how that

succession is the systematization of the science of Philosophy itself. But a distinction is to be noted here: that which first commences is implicit, immediate, abstract, general — it is what has not yet advanced; the more concrete and richer comes later, and the first is poorer in determinations. This may appear contrary to one's first impressions, but philosophic ideas are often enough directly opposed to ordinary ideas, and what is generally supposed, is not found to be the case. It may be thought that what comes first must be the concrete. The child, for instance, as still in the original totality of his nature, is thought to be more concrete than the man, hence we imagine the latter to be more limited, no longer forming a totality, but living an abstract life. Certainly the man acts in accordance with definite ends, not bringing his whole soul and mind into a subject, but splitting his life into a number of abstract unities. The child and the youth, on the contrary, act straight from the fulness of the heart. Feeling and sense-perception come first, thought last, and thus feeling appears to us to be more concrete than thought, or the activity of abstraction and of the universal. In reality, it is just the other way. The sensuous consciousness is certainly the more concrete, and if poorer in thought, at least richer in content. We must thus distinguish the naturally concrete from the concrete of thought, which on its side, again, is wanting in sensuous matter. The child is also the most abstract and the poorest in thought: as to what pertains to nature, the man is abstract, but in thought he is more concrete than the child. Man's ends and objects are undoubtedly abstract in general affairs, such as in maintaining his family or performing his business duties, but he contributes to a great objective organic whole, whose progress he advances and directs. In the acts of a child, on the other hand, only a childish and, indeed, momentary "I," and in those of the youth the subjective constitution or the random aim, form the principle of action. It is in this way that science is more concrete than sense-perception.

In applying this to the different forms of Philosophy, it follows in the first place, that the earliest philosophies are the poorest and the most abstract. In them the Idea is least determined; they keep merely to generalities not yet realized. This must be known in order that we may not seek behind the old philosophies for more than we are entitled to find; thus we need not require from them determinations proceeding from a deeper consciousness. For instance, it has been asked whether the philosophy of Thales is, properly speaking, Theism or Atheism,[5] whether he asserted a personal God or merely an impersonal, universal existence. The question here regards the attribution of subjectivity to the highest Idea, the conception of the Personality of God. Such subjectivity as we comprehend it, is a much richer, more concentrated, and therefore much later conception, which need not be sought for in distant ages. The Greek gods had, indeed, personality in imagination and idea like the one God of the Jewish religion, but to know what is the mere picture of fancy, and what the insight of pure Thought and Notion, is quite another thing. If we take as basis our own ideas judged by these deeper conceptions, an ancient Philosophy may undoubtedly be spoken of as Atheism. But this expression would at the same time be false, for the thoughts as thoughts in beginning, could not have arrived at the development which we have reached.

From this it follows — since the progress of development is equivalent to further determination, and this means further immersion in and a fuller grasp of the Idea itself — that the latest, most modern and newest philosophy is the most developed, richest and deepest. In that philosophy everything which at first seems to be past and gone must be preserved and retained, and it must itself be a mirror of the whole history. The original philosophy is the most abstract, because it is the original and has not as yet made any movement forward; the last, which proceeds from this forward

and impelling influence, is the most concrete. This, as may at once be remarked, is no mere pride in the philosophy of our time, because it is in the nature of the whole process that the more developed philosophy of a later time is really the result of the previous operations of the thinking mind; and that it, pressed forwards and onwards from the earlier standpoints, has not grown up on its own account or in a state of isolation.

It must also be recollected that we must not hesitate to say, what is naturally implied, that the Idea, as comprehended and shown forth in the latest and newest philosophy, is the most developed, the richest and deepest. I call this to remembrance because the designation, new or newest of all in reference to Philosophy, has become a very common by-word. Those who think they express anything by using such terms might quite easily render thanks respecting any number of philosophies just as fast as their inclination directs, regarding either every shooting-star and even every candle-gleam in the light of a sun, or else calling every popular cry a philosophy, and adducing as proof that at any rate there are so many philosophies that every day one displaces another. Thus they have the category in which they can place any apparently significant philosophy, and through which they may at the same time set it aside; this they call a fashion-philosophy.

"Scoffer, thou call'st this but a fleeting phase
When the Spirit of Man once again and anew,
Strives earnestly on, towards forms that are higher."

A second consequence has regard to the treatment of the older philosophies. Such insight also prevents us from ascribing any blame to the philosophies when we miss determinations in them which were not yet present to their culture, and similarly it prevents our burdening them with deductions and assertions which were neither made nor thought of by them, though they might correctly enough allow themselves to be derived from

the thought of such a philosophy. It is necessary to set to work on an historical basis, and to ascribe to Philosophy what is immediately given to us, and that alone. Errors crop up here in most histories of Philosophy, since we may see in them a number of metaphysical propositions ascribed to a philosopher and given out as an historical statement of the views which he has propounded, of which he neither thought nor knew a word, and of which there is not the slightest trace found in history. Thus in Brucker's great History of Philosophy (Pt. I. pp. 465-478 seq.) a list of thirty, forty, or a hundred theorems are quoted from Thales and others, no idea of which can be traced in history as having been present to these philosophers. There are also propositions in support of them and citations taken from discussions of a similar kind with which we may occupy ourselves long enough. Brucker's method is to endow the single theorem of an ancient philosopher with all the consequences and premises which must, according to the idea of the Wolffian Metaphysics, be the premises and conclusions of that theorem, and thus easily to produce a simple, naked fiction as if it were an actual historical fact. Thus, according to Brucker, Thales said, *Ex nihilo fit nihil*, since he said that water was eternal. Thus, too, he was to be counted amongst the philosophers who deny creation out of nothing; and of this, historically at least, Thales was ignorant. Professor Ritter, too, whose history of Ionic Philosophy is carefully written, and who on the whole is cautious not to introduce foreign matter, has very possibly ascribed to Thales more than is found in history. He says (pp. 12, 13), "Hence we must regard the view of nature which we find in Thales as dynamic in principle. He regarded the world as the all-embracing, living animal which has developed from a germ like every other animal, and this germ, like that of all other animals, is either damp or water. Thus the fundamental idea of Thales is that the world is a living whole which has developed from a germ and carries on its life as does an animal, by means of nourishment suitable

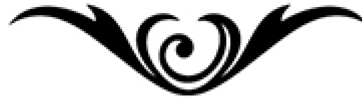
to its nature" (cf. p. 16). This is quite a different account from that of Aristotle, and none of it is communicated by the ancients regarding Thales. The sequence of thought is evident, but historically it is not justified. We ought not by such deductions to make an ancient philosophy into something quite different from what it originally was.

We are too apt to mould the ancient philosophers into our own forms of thought, but this is just to constitute the progress of development; the difference in times, in culture and in philosophies, depends on whether certain reflections, certain thought determinations, and certain stages in the Notion have come to consciousness, whether a consciousness has been developed to a particular point or not. The history of Philosophy has simply to deal with this development and bringing forth of thought. The determinations involved certainly follow from a proposition, but whether they are put forth as yet or not is quite another thing, and the bringing forth of the inner content is the only matter of importance. We must therefore only make use of the words which are actually literal, for to use further thought determinations which do not yet belong to the consciousness of the philosopher in question, is to carry on development. Thus Aristotle states that Thales has defined the principle (*ἀρχή*) of every thing to be water. But Anaximander first made use of *ἀρχή*, and Thales thus did not possess this determination of thought at all; he recognized *ἀρχή* as commencement in time, but not as the fundamental principle. Thales did not once introduce the determination of cause into his philosophy, and first cause is a further determination still. There are whole nations which have not this conception at all; indeed it involves a great step forward in development. And seeing that difference in culture on the whole depends on difference in the thought determinations which are manifested, this must be so still more with respect to philosophies.

Now, as in the logical system of thought each of its forms has its own place in which alone it suffices, and this form becomes, by means of ever-progressing development, reduced to a subordinate element, each philosophy is, in the third place, a particular stage in the development of the whole process and has its definite place where it finds its true value and significance. Its special character is really to be conceived of in accordance with this determination, and it is to be considered with respect to this position in order that full justice may be done to it. On this account nothing more must be demanded or expected from it than what it actually gives, and the satisfaction is not to be sought for in it, which can only be found in a fuller development of knowledge. We must not expect to find the questions of our consciousness and the interest of the present world responded to by the ancients; such questions presuppose a certain development in thought. Therefore every philosophy belongs to its own time and is restricted by its own limitations, just because it is the manifestation of a particular stage in development. The individual is the offspring of his people, of his world, whose constitution and attributes are alone manifested in his form; he may spread himself out as he will, he cannot escape out of his time any more than out of his skin, for he belongs to the one universal Mind which is his substance and his own existence. How should he escape from this? It is the same universal Mind that is embraced by thinking Philosophy; that Philosophy is Mind's thought of itself and therefore its determinate and substantial content. Every philosophy is the philosophy of its own day, a link in the whole chain of spiritual development, and thus it can only find satisfaction for the interests belonging to its own particular time.

On this account an earlier philosophy does not give satisfaction to the mind in which a deeper conception reigns. What Mind seeks for in Philosophy is this conception which already constitutes its inward determination and the root of its existence conceived of as object to

thought; Mind demands a knowledge of itself. But in the earlier philosophy the Idea is not yet present in this determinate character. Hence the philosophy of Plato and Aristotle, and indeed all philosophies, ever live and are present in their principles, but Philosophy no longer has the particular form and aspect possessed by that of Plato and of Aristotle. We cannot rest content with them, and they cannot be revived; hence there can be no Platonists, Aristotelians, Stoics, or Epicureans to-day. To re-awaken them would be to try to bring back to an earlier stage the Mind of a deeper culture and self-penetration. But this cannot be the case; it would be an impossibility and as great a folly as were a man to wish to expend his energies in attaining the standpoint of the youth, the youth in endeavouring to be the boy or child again; whereas the man, the youth, and the child, are all one and the same individual. The period of revival in the sciences, the new epoch in learning which took place in the fifteenth and sixteenth centuries, began not only with the revived study of, but also with the re-animation of the old philosophies. Marsilius Ficinus was a Platonist; an Academy of Platonic philosophy was established and installed with professors by Cosmos de Medici, and Ficinus was placed at the head of it. There were pure Aristotelians like Pomponius: Gassendi later on maintained the Epicurean philosophy, for his philosophy dealt with Physics after the manner of the Epicureans; Lipsius wished to be a Stoic, and so on. The sense of opposition was so great, ancient philosophy and Christianity — from or in which no special philosophy had developed — were so diverse, that no philosophy peculiar to itself could develop in Christianity. What was or could be had as philosophy, either in conformity with or in opposition to Christianity, was a certain ancient philosophy which was thus taken up anew. But mummies when brought amongst living beings cannot there remain. Mind had for long possessed a more substantial life, a more profound Notion of itself, and hence its thought had higher needs than such



as could be satisfied by these philosophies. A revival such as this is then to be regarded only as the transitory period in which we learn to know the forms which are implied and which have gone before, and as the renewal of former struggles through the steps necessary in development. Such reconstructions and repetitions in a distant time of principles which have become foreign to Mind, are in history transitory only, and formed in a language which is dead. Such things are translations only and not originals, and Mind does not find satisfaction excepting in knowledge of its own origination.

When modern times are in the same way called upon to revert to the standpoint of an ancient philosophy (as is recommended specially in regard to the philosophy of Plato) in order to make this a means of escaping from the complications and difficulties of succeeding times, this reversion does not come naturally as in the first case. This discreet counsel has the same origin as the request to cultivated members of society to turn back to the customs and ideas of the savages of the North American forests, or as the recommendation to adopt the religion of Melchisedec which Fichte[6] has maintained to be the purest and simplest possible, and therefore the one at which we must eventually arrive. On the one hand, in this retrogression the desire for an origin and for a fixed point of departure is unmistakable, but such must be sought for in thought and Idea alone and not in an authoritatively given form. On the other hand, the return of the developed, enriched Mind to a simplicity such as this — which means to an abstraction, an abstract condition or thought — is to be regarded only as the escape of an incapacity which cannot enjoy the rich material of development which it sees before it, and which demands to be controlled and comprehended in its very depths by thought, but seeks a refuge in fleeing from the difficulty and in mere sterility.

From what has been said it is quite comprehensible how so many of those who, whether induced by some special attraction such as this, or simply by the fame of a Plato or ancient philosophy in general, direct their way thereto in order to draw their own philosophy from these sources, do not find themselves satisfied by the study, and unjustifiably quit such altogether. Satisfaction is found in them to a certain extent only. We must know in ancient philosophy or in the philosophy of any given period, what we are going to look for. Or at least we must know that in such a philosophy there is before us a definite stage in the development of thought, and in it those forms and necessities of Mind which lie within the limits of that stage alone are brought into existence. There slumber in the Mind of modern times ideas more profound which require for their awakening other surroundings and another present than the abstract, dim, grey thought of olden times. In Plato, for instance, questions regarding the nature of freedom, the origin of evil and of sin, providence, &c., do not find their philosophic answer. On such subjects we certainly may in part take the ordinary serious views of the present time, and in part philosophically set their consideration altogether aside, or else consider sin and freedom as something negative only. But neither the one plan nor the other gives freedom to Mind if such subjects have once been explicitly for it, and if the opposition in self-consciousness has given it the power of sinking its interests therein. The case is similar with regard to questions regarding the limits of knowledge, the opposition between subjectivity and objectivity which had not yet come up in Plato's age. The independence of the "I" within itself and its explicit existence was foreign to him; man had not yet gone back within himself, had not yet set himself forth as explicit. The subject was indeed the individual as free, but as yet he knew himself only as in unity with his Being. The Athenian knew himself to be free, as such, just as the Roman citizen would, as *ingenuus*. But the fact that man is in and for

himself free, in his essence and as man, free born, was known neither by Plato, Aristotle, Cicero, nor the Roman legislators, even though it is this conception alone which forms the source of law. In Christianity the individual, personal mind for the first time becomes of real, infinite and absolute value; God wills that all men shall be saved. It was in the Christian religion that the doctrine was advanced that all men are equal before God, because Christ has set them free with the freedom of Christianity. These principles make freedom independent of any such things as birth, standing or culture. The progress made through them is enormous, but they still come short of this, that to be free constitutes the very idea of man. The sense of this existent principle has been an active force for centuries and centuries, and an impelling power which has brought about the most tremendous revolutions; but the conception and the knowledge of the natural freedom of man is a knowledge of himself which is not old.

B The Relation of Philosophy to other Departments of Knowledge.

THE HISTORY OF Philosophy has to represent this science in that form of time and individualities from which its outward form has resulted. Such a representation has, however, to shut out from itself the external history of the time, and to take into account only the general character of the people and time, and likewise their circumstances as a whole. But as a matter of fact, the history of Philosophy does present this character, and that indeed in the highest possible degree; its connection with it is of the closest kind, and the particular appearance presented by a philosophy belonging to one special period, is only a particular aspect or element in the character. Because of this inward correspondence we have partly to consider more closely the particular relation borne by a philosophy to its historical surroundings, and partly, but pre-eminently, what is proper to itself, from which alone, after separating everything related however closely, we can fix our standpoint. This connection, which is not merely external but essential, has thus two sides, which we must consider. The first is the distinctly historical side, the second is the connection with other matters — the connection of Philosophy with Religion, for instance, by which we at once obtain a deeper conception of Philosophy itself.

1. The Historical side of this Connection.

It is usually said that political affairs and such matters as Religion are to be taken into consideration because they have exercised a great influence on the Philosophy of the time, and similarly it exerts an influence upon them.

But when people are content with such a category as "great influence" they place the two in an external relationship, and start from the point of view that both sides are for themselves independent. Here, however, we must think of this relationship in another category, and not according to the influence or effect of one upon the other. The true category is the unity of all these different forms, so that it is one Mind which manifests itself in, and impresses itself upon these different elements.

a. *Outward and historical conditions imposed upon Philosophy.*

It must be remarked in the first place, that a certain stage is requisite in the intellectual culture of a people in order that it may have a Philosophy at all. Aristotle says, "Man first begins to philosophize when the necessities of life are supplied" (Metaphysics, I. 2); because since Philosophy is a free and not self-seeking activity, cravings of want must have disappeared, a strength, elevation and inward fortitude of mind must have appeared, passions must be subdued and consciousness so far advanced, before what is universal can be thought of. Philosophy may thus be called a kind of luxury, in so far as luxury signifies those enjoyments and pursuits which do not belong to external necessity as such. Philosophy in this respect seems more capable of being dispensed with than anything else; but that depends on what is called indispensable. From the point of view of mind, Philosophy may even be said to be that which is most essential.

b. *The commencement in History of an intellectual necessity for Philosophy.*

However much Philosophy, as the thought and conception of the Mind of a particular time, is *à priori*, it is at the same time just as really a result, since the thought produced and, indeed, the life and action are produced to produce themselves. This activity contains the essential element of a negation, because to produce is also to destroy; Philosophy in producing itself, has the natural as its starting point in order to abrogate it again.

Philosophy thus makes its appearance at a time when the Mind of a people has worked its way out of the indifference and stolidity of the first life of nature, as it has also done from the standpoint of the emotional, so that the individual aim has blotted itself out. But as Mind passes on from its natural form, it also proceeds from its exact code of morals and the robustness of life to reflection and conception. The result of this is that it lays hold of and troubles this real, substantial kind of existence, this morality and faith, and thus the period of destruction commences. Further progress is then made through the gathering up of thought within itself. It may be said that Philosophy first commences when a race for the most part has left its concrete life, when separation and change of class have begun, and the people approach toward their fall; when a gulf has arisen between inward strivings and external reality, and the old forms of Religion, &c., are no longer satisfying; when Mind manifests indifference to its living existence or rests unsatisfied therein, and moral life becomes dissolved. Then it is that Mind takes refuge in the clear space of thought to create for itself a kingdom of thought in opposition to the world of actuality, and Philosophy is the reconciliation following upon the destruction of that real world which thought has begun. When Philosophy with its abstractions paints grey in grey, the freshness and life of youth has gone, the reconciliation is not a reconciliation in the actual, but in the ideal world. Thus the Greek philosophers held themselves far removed from the business of the State and were called by the people idlers, because they withdrew themselves within the world of thought.

This holds good throughout all the history of Philosophy. It was so with Ionic Philosophy in the decline of the Ionic States in Asia Minor. Socrates and Plato had no more pleasure in the life of the State in Athens, which was in the course of its decline; Plato tried to bring about something better with Dionysius. Thus in Athens, with the ruin of the Athenian people, the period

was reached when Philosophy appeared. In Rome, Philosophy first expanded in the decline of the Republic and of Roman life proper, under the despotism of the Roman Emperors: a time of misfortune for the world and of decay in political life, when earlier religious systems tottered and everything was in the process of struggle and disintegration. With the decline of the Roman Empire, which was so great, rich and glorious, and yet inwardly dead, the height and indeed the zenith of ancient Philosophy is associated through the Neo-Platonists at Alexandria. It was also in the fifteenth and sixteenth centuries, when the Teutonic life of the Middle Ages acquired another form, that Philosophy first became taught, though it was later on that it attained to independence. Before that, political life still existed in unity with Religion, or if the State fought against the Church, the Church still kept the foremost place, but now the gulf between Church and State came into existence. Philosophy thus comes in at a certain epoch only in the development of the whole.

c. *Philosophy as the thought of its time.*

But men do not at certain epochs, merely philosophize in general, for there is a definite Philosophy which arises among a people, and the definite character of the standpoint of thought is the same character which permeates all the other historical sides of the spirit of the people, which is most intimately related to them, and which constitutes their foundation. The particular form of a Philosophy is thus contemporaneous with a particular constitution of the people amongst whom it makes its appearance, with their institutions and forms of government, their morality, their social life and the capabilities, customs and enjoyments of the same; it is so with their attempts and achievements in art and science, with their religious, warfares and external relationships, likewise with the decadence of the States in which this particular principle and form had maintained its supremacy, and with the origination and progress of new States in which a higher principle

finds its manifestation and development. Mind in each case has elaborated and expanded in the whole domain of its manifold nature the principle of the particular stage of self-consciousness to which it has attained. Thus the Mind of a people in its richness is an organization, and, like a Cathedral, is divided into numerous vaults, passages, pillars and vestibules, all of which have proceeded out of one whole and are directed to one end. Philosophy is one form of these many aspects. And which is it? It is the fullest blossom, the Notion of Mind in its entire form, the consciousness and spiritual essence of all things, the spirit of the time as spirit present in itself. The multifarious whole is reflected in it as in the single focus, in the Notion which knows itself.

The Philosophy which is essential within Christianity could not be found in Rome, for all the various forms of the whole are only the expression of one and the same determinate character. Hence political history, forms of government, art and religion are not related to Philosophy as its causes, nor, on the other hand, is Philosophy the ground of their existence — one and all have the same common root, the spirit of the time. It is one determinate existence, one determinate character which permeates all sides and manifests itself in politics and in all else as in different elements; it is a condition which hangs together in all its parts, and the various parts of which contain nothing which is really inconsistent, however diverse and accidental they may appear to be, and however much they may seem to contradict one another. This particular stage is the product of the one preceding. But to show how the spirit of a particular time moulds its whole actuality and destiny in accordance with its principle, to show this whole edifice in its conception, is far from us — for that would be the object of the whole philosophic world-history. Those forms alone concern us which express the principle of the Mind in a spiritual element related to Philosophy.

This is the position of Philosophy amongst its varying forms, from which it follows that it is entirely identical with its time. But if Philosophy does not stand above its time in content, it does so in form, because, as the thought and knowledge of that which is the substantial spirit of its time, it makes that spirit its object. In as far as Philosophy is in the spirit of its time, the latter is its determined content in the world, although as knowledge, Philosophy is above it, since it places it in the relation of object. But this is in form alone, for Philosophy really has no other content. This knowledge itself undoubtedly is the actuality of Mind, the self-knowledge of Mind which previously was not present: thus the formal difference is also a real and actual difference. Through knowledge, Mind makes manifest a distinction between knowledge and that which is; this knowledge is thus what produces a new form of development. The new forms at first are only special modes of knowledge, and it is thus that a new Philosophy is produced: yet since it already is a wider kind of spirit, it is the inward birthplace of the spirit which will later arrive at actual form. We shall deal further with this in the concrete below, and we shall then see that what the Greek Philosophy was, entered, in the Christian world, into actuality.

2. Separation of Philosophy from other allied departments of Knowledge.

The history of the other Sciences, of culture and above all the history of art and of religion are, partly in regard to the elements contained in them, and partly to their particular objects, related to the history of Philosophy. It is through this relationship that the treatment of the history of Philosophy has been so confused. If it is to concern itself with the possession of culture generally and then with scientific culture, and then again with popular myths and the dogmas contained only in them, and yet farther with the religious reflections which are already thoughts of a speculative kind, and which make their appearance in them, no bounds are left to Philosophy at

all. This is so, partly on account of the amount of material itself and the labour required in working it up and preparing it, and partly because it is in immediate connection with so much else. But the separation must not be made arbitrarily or as by chance, but must be derived from fundamental determinations. If we merely look at the name of Philosophy, all this matter will pertain to its history.

I shall speak of this material from three points of view, for three related aspects are to be eliminated and separated from Philosophy. The first of these is that which is generally considered to be the domain of science, and in which are found the beginnings of understanding thought. The second region is that of mythology and religion; the relation of Philosophy to them seems often to be inimical both in the time of the Greeks and of the Christians. The third is that of philosophizing and the metaphysics of the understanding. While we distinguish what is related to Philosophy, we must also take note of the elements in this related matter which belong to the Notion of Philosophy, but which appear to us to be partially separated from it: and thus we may become acquainted with the Notion of Philosophy.

a. *Relation of Philosophy to Scientific Knowledge.*

Knowledge and thought certainly form the element of whatever has to do with particular sciences as they form the element of Philosophy; but their subjects are mainly finite subjects and appearance. A collection of facts known about this content is by its nature excluded from Philosophy: neither this content nor such a form has anything to do with it. But even if the sciences are systematic and contain universal principles and laws from which they proceed, they are still related to a limited circle of objects. The ultimate principles are assumed as are the objects themselves; that is, the outward experience or the feelings of the heart, natural or educated sense of right and duty, constitute the source from which they are created. Logic and

the determinations and principles of thought in general are in their methods assumed.

The forms of thought or the points of view and principles which hold good in the sciences and constitute the ultimate support of all their matter, are not peculiar to them, but are common to the condition and culture of the time and of the people. This culture consists mainly in the general ideas and aims, in the whole extent of the particular intellectual powers dominating consciousness and life. Our consciousness has these ideas and allows them to be considered ultimate determinations; it makes use of them as guiding and connecting links, but does not know them and does not even make them the objects of its consideration. To give an abstract example, each act of consciousness has and requires the whole abstract thought-determination of Being. "The sun is in the heavens, the bunch of grapes is ripe," and so on into infinitude. Again, in a higher culture, such relations as those of cause and effect are involved, as also those of force and its manifestation. All its knowledge and ideas are permeated and governed by a metaphysic such as this; it is the net in which all the concrete matter which occupies mankind in action and in impulses, is grasped. But this web and its knots in our ordinary consciousness are sunk into a manifold material, for it contains the objects and interests which we know and which we have before us. These common threads are not drawn up and made explicitly the objects of our reflection.

We Germans seldom now count general scientific knowledge as Philosophy. And yet traces of this are found, as for instance, in the fact that the philosophic Faculty contains all the Sciences which have not as their immediate aim the Church and State. In connection with this, the significance of the name of Philosophy, which is even now an important matter of discussion in England, comes in question. Natural Sciences are in

England called Philosophy. A “Philosophic Journal” in England, edited by Thompson, treats of Chemistry, Agriculture, Manuring, Husbandry, Technology, like Hermbstädt’s Journal, and gives inventions connected therewith. The English call physical instruments, such as the barometer and thermometer, philosophical instruments. Theories too, and especially morality and the moral sciences, which are derived from the feelings of the human heart or from experience, are called Philosophy, and finally this is also so with the theories and principles of Political Economy. And thus at least in England, is the name of Philosophy respected. Some time ago a banquet took place under the presidency of Lord Liverpool, at which the minister Canning was also present. The latter in returning thanks congratulated England in having philosophic principles of government there brought into operation. There, at least, Philosophy is no by-word.

In the first beginnings of culture, however, we are more often met by this admixture of Philosophy and general knowledge. There comes a time to a nation when mind applies itself to universal objects, when, for example, in seeking to bring natural things under general modes of understanding, it tries to learn their causes. Then it is said that a people begins to philosophize, for this content has thought in common with Philosophy. At such a time we find deliverances about all the common events of Nature, as we also find intellectual maxims, moral sentences, general principles respecting morality, the will, duty, and the like, and those who expressed them have been called wise men or philosophers. Thus in the beginnings of Greek Philosophy we find the seven sages and the Ionic Philosophers. From them a number of ideas and discoveries are conveyed to us which seem like philosophic propositions. Thus Thales, amongst others, has explained that the eclipse of sun and moon is due to the intervention of the moon or earth. This is called a theorem. Pythagoras found out the principle of the harmony of sounds. Others have had ideas about the stars: the heavens were

supposed to be composed of perforated metal, by which we see throughout the empyrean region, the eternal fire which surrounds the world. Such propositions as products of the understanding, do not belong to the history of Philosophy, although they imply that the merely sensuous gaze has been left behind, as also the representation of those objects by the imagination only. Earth and heaven thus become unpeopled with gods, because the understanding distinguishes things in their outward and natural qualities from Mind.

In a later time the epoch of the revival in the sciences is as noteworthy in this respect. General principles regarding the state, &c., were given expression to, and in them a philosophic side cannot be mistaken. To this place the philosophic systems of Hobbes and Descartes belong: the writings of the latter contain philosophic principles, but his Philosophy of Nature is quite empirical. Hugo Grotius composed an international law in which what was historically held by the people as law, the *consensus gentium*, was a main element. Though, earlier, medicine was a collection of isolated facts and a theosophic combination mixed up with astrology, &c. (it is not so long ago since cures were effected by sacred relics), a mode of regarding nature came into vogue according to which men went forth to discover the laws and forces of Nature. The *à priori* reasoning regarding natural things, according to the metaphysics of the Scholastic Philosophy or to Religion, has now been given up. The Philosophy of Newton contains nothing but Natural Science, that is, the knowledge of the laws, forces, and general constitution of Nature, derived from observation and from experience. However much this may seem to be contrary to the principle of Philosophy, it has in common with it the fact that the bases of both are universal, and still further that *I* have made this experience, that it rests on my consciousness and obtains its significance through me.

This form is in its general aspect antagonistic to the positive, and has come forward as particularly opposed to Religion and to that which is positive in it. If, in the Middle Ages, the Church had its dogmas as universal truths, man, on the contrary, has now obtained from the testimony of his "own thought," feeling and ideas, a mistrust of these. It is merely to be remarked of this that "my own thought" is in itself a pleonasm, because each individual must think for himself, and no one can do so for another. Similarly this principle has turned against the recognized constitutions and has sought different principles instead, by them to correct the former. Universal principles of the State have now been laid down, while earlier, because religion was positive, the ground of obedience of subjects to princes and of all authority were also so. Kings, as the anointed of the Lord, in the sense that Jewish kings were so, derived their power from God, and had to give account to Him alone, because all authority is given by God. So far theology and jurisprudence were on the whole fixed and positive sciences, wherever this positive character might have been derived. Against this external authority reflection has been brought to bear, and thus, especially in England, the source of public and civil law became no longer mere authority derived from God like the Mosaic Law. For the authority of kings other justification was sought, such as the end implied in the State, the good of the people. This forms quite another source of truth, and it is opposed to that which is revealed, given and positive. This substitution of another ground than that of authority has been called philosophizing.

The knowledge was then a knowledge of what is finite — the world of the content of knowledge. Because this content proceeded through the personal insight of human reason, man has become independent in his actions. This independence of the Mind is the true moment of Philosophy, although the Notion of Philosophy through this formal determination, which limits it to finite objects, has not yet been exhausted. This independent

thought is respected, has been called human wisdom or worldly wisdom, for it has had what is earthly as its object, and it took its origin in the world. This was the meaning of Philosophy, and men did rightly to call it worldly wisdom. Frederick von Schlegel revived this by-name for Philosophy, and desired to indicate by it that what concerns higher spheres, such as religion, must be kept apart; and he had many followers. Philosophy, indeed, occupies itself with finite things, but, according to Spinoza, as resting in the divine Idea: it has thus the same end as religion. To the finite sciences which are now separated also from Philosophy, the Churches objected that they led men away from God, since they have as objects only what is finite. This defect in them, conceived of from the point of view of content, leads us to the second department allied to Philosophy, — that is, to Religion.

b. *Relation of Philosophy to Religion.*

As the first department of knowledge was related to Philosophy principally by means of formal and independent knowledge, Religion, though in its content quite different from this first kind or sphere of knowledge, is through it related to Philosophy. Its object is not the earthly and worldly, but the infinite. In the case of art and still more in that of Religion, Philosophy has in common a content composed entirely of universal objects; they constitute the mode in which the highest Idea is existent for the unphilosophical feeling, the perceiving and imagining consciousness. Inasmuch as in the progress of culture in time the manifestation of Religion precedes the appearance of Philosophy, this circumstance must really be taken account of, and the conditions requisite for beginning the History of Philosophy have to depend on this, because it has to be shown in how far what pertains to Religion is to be excluded from it, and that a commencement must not be made with Religion.

In Religion, races of men have undoubtedly expressed their idea of the nature of the world, the substance of nature and of intellect and the relation of man thereto. Absolute Being is here the object of their consciousness; and as such, is for them pre-eminently the "other," a "beyond," nearer or further off, more or less friendly or frightful and alarming. In the act and forms of worship this opposition is removed by man, and he raises himself to the consciousness of unity with his Being, to the feeling of, or dependence on, the Grace of God, in that God has reconciled mankind to Himself. In conception, with the Greeks, for instance, this existence is to man one which is already in and for itself and friendly, and thus worship is but the enjoyment of this unity. This existence is now reason which is existent in and for itself, the universal and concrete substance, the Mind whose first cause is objective to itself in consciousness; it thus is a representation of this last in which not only reason in general, but the universal infinite reason is. We must, therefore, comprehend Religion, as Philosophy, before everything else, which means to know and apprehend it in reason; for it is the work of self-revealing reason and is the highest form of reason. Such ideas as that priests have framed a people's Religion in fraud and self-interest are consequently absurd; to regard Religion as an arbitrary matter or a deception is as foolish as it is perverted. Priests have often profaned Religion — the possibility of which is a consequence of the external relations and temporal existence of Religion. It can thus, in this external connection, be laid hold of here and there, but because it is Religion, it is really that which stands firm against finite ends and their complications and constitutes a region exalted high above them. This region of Mind is really the Holy place of Truth itself, the Holy place in which are dissolved the remaining illusions of the sensuous world, of finite ideas and ends, and of the sphere of opinion and caprice.

Inasmuch as it really is the content of religions, this rational matter might now seem to be capable of being abstracted and expressed as a number of historical theorems. Philosophy stands on the same basis as Religion and has the same object — the universal reason existing in and for itself; Mind desires to make this object its own, as is done with Religion in the act and form of worship. But the form, as it is present in Religion, is different from what is found to be contained in Philosophy, and on this account a history of Philosophy is different from a history of Religion. Worship is only the operation of reflection; Philosophy attempts to bring about the reconciliation by means of thinking knowledge, because Mind desires to take up its Being into itself. Philosophy is related in the form of thinking consciousness to its object; with Religion it is different. But the distinction between the two should not be conceived of so abstractly as to make it seem that thought is only in Philosophy and not in Religion. The latter has likewise ideas and universal thoughts. Because both are so nearly related, it is an old tradition in the history of Philosophy to deduce Philosophy from Persian, Indian, or similar philosophy, a custom which is still partly retained in all histories of Philosophy. For this reason, too, it is a legend universally believed, that Pythagoras, for instance, received his Philosophy from India and Egypt; the fame of the wisdom of these people, which wisdom is understood also to contain Philosophy, is an old one. The Oriental ideas and religious worship which prevailed throughout the West up to the time of the Roman Empire, likewise bear the name of Oriental Philosophy. The Christian Religion and Philosophy are thought of in the Christian world, as more definitely divided; in these Eastern days, on the other hand, Religion and Philosophy are still conceived of as one in so far as that the content has remained in the form in which it is Philosophy. Considering the prevalence of these ideas and in order to have a definite limit to the relations between a history of Philosophy and religious ideas, it is desirable to note some further

considerations as to the form which separates religious ideas from philosophical theorems.

Religion has not only universal thought as inward content *implicite* contained in its myths, ideas, imaginations and in its exact and positive histories, so that we require first of all to dig this content out of such myths in the form of theorems, but it often has its content *explicite* in the form of thought. In the Persian and Indian Religions very deep, sublime and speculative thoughts are even expressed. Indeed, in Religion we even meet philosophies directly expressed, as in the Philosophy of the Fathers. The scholastic Philosophy really was Theology; there is found in it a union or, if you will, a mixture of Theology and Philosophy which may very well puzzle us. The question which confronts us on the one side is, how Philosophy differs from Theology, as the science of Religion, or from Religion as consciousness? And then, in how far have we in the history of Philosophy to take account of what pertains to Religion? For the reply to this last question three aspects have again to be dealt with; first of all the mythical and historical aspect of Religion and its relation to Philosophy; in the second place the theorems and speculative thoughts directly expressed in Religion; and in the third place we must speak of Philosophy within Theology.

α. Difference between Philosophy and Religion.

The consideration of the mythical aspect of Religion or the historical and positive side generally, is interesting, because from it the difference in respect of form will show in what this content is antagonistic to Philosophy. Indeed, taken in its connections, its difference passes into apparent inconsistency. This diversity is not only found in our contemplation but forms a very definite element in history. It is required by Philosophy that it should justify its beginning and its manner of knowledge, and Philosophy has thus placed itself in opposition to Religion. On the other hand

Philosophy is combated and condemned by Religion and by the Churches. The Greek popular religion indeed, proscribed several philosophers; but the opposition is even more apparent in the Christian Church. The question is thus not only whether regard is to be paid to Religion in the history of Philosophy, for it has been the case that Philosophy has paid attention to Religion, and the latter to the former. Since neither of the two has allowed the other to rest undisturbed, we are not permitted to do so either. Of their relations, therefore, we must speak definitely, openly and honestly — *aborder la question*, as the French say. We must not hesitate, as if such a discussion were too delicate, nor try to help ourselves out by beating about the bush; nor must we seek to find evasions or shifts, so that in the end no one can tell what we mean. We must not seem to wish to leave Religion alone. This is nothing else than to appear to wish to conceal the fact that Philosophy has directed its efforts against Religion. Religion, that is, the theologians, are indeed the cause of this; they ignore Philosophy, but only in order that they may not be contradicted in their arbitrary reasoning.

It may appear as if Religion demanded that man should abstain from thinking of universal matters and Philosophy because they are merely worldly wisdom and represent human operations. Human reason is here opposed to the divine. Men are, indeed, well accustomed to a distinction between divine teaching and laws and human power and inventions, such that under the latter everything is comprehended which in its manifestation proceeds from the consciousness, the intelligence or the will of mankind; which makes all this opposed to the knowledge of God and to things rendered divine by divine revelation. But the depreciation of what is human expressed by this opposition is then driven further still, inasmuch as while it implies the further view that man is certainly called upon to admire the wisdom of God in Nature, and that the grain, the mountains, the cedars of Lebanon in all their glory, the song of the birds in the bough, the superior

skill and the domestic instincts of animals are all magnified as being the work of God, it also implies that the wisdom, goodness and justice of God is, indeed, pointed out in human affairs, but not so much in the disposition or laws of man or in actions performed voluntarily and in the ordinary progress of the world, as in human destiny, that is, in that which is external and even arbitrary in relation to knowledge and free-will. Thus what is external and accidental is regarded as emphatically the work of God, and what has its root in will and conscience, as the work of man. The harmony between outward relations, circumstances and events and the general aims of man is certainly something of a higher kind, but this is the case only for the reason that this harmony is considered with respect to ends which are human and not natural — such as those present in the life of a sparrow which finds its food. But if the summit of everything is found in this, that God rules over Nature, what then is free-will? Does He not rule over what is spiritual, or rather since He himself is spiritual, in what is spiritual? and is not the ruler over or in the spiritual region higher than a ruler over or in Nature? But is that admiration of God as revealed in natural things as such, in trees and animals as opposed to what is human, far removed from the religion of the ancient Egyptians, which derived its knowledge of what is divine from the ibis, or from cats and dogs? or does it differ from the deplorable condition of the ancient and the modern Indians, who held and still hold cows and apes in reverence, and are scrupulously concerned for the maintenance and nourishment of these animals, while they allow men to suffer hunger; who would commit a crime by removing the pangs of starvation through their slaughter or even by partaking of their food?

It seems to be expressed by such a view that human action as regards Nature is ungodly; that the operations of Nature are divine operations, but what man produces is ungodly. But the productions of human reason might, at least, be esteemed as much as Nature. In so doing, however, we cede less

to reason than is permitted to us. If the life and the action of animals be divine, human action must stand much higher, and must be worthy to be called divine in an infinitely higher sense. The preeminence of human thought must forthwith be avowed. Christ says on this subject (Matt. vi. 26-80), “Behold the fowls of the air,” (in which we may also include the Ibis and the *Kokilas*,) “are ye not much better than they? Wherefore, if God so clothe the grass of the field, which to-day is, and to-morrow is cast into the oven, shall He not much more clothe you?” The superiority of man, of the image of God, to animals and plants is indeed implicitly and explicitly established, but in asking wherein the divine element is to be sought and seen — in making use of such expressions — none of the superior, but only the inferior nature, is indicated. Similarly, in regard to the knowledge of God, it is remarkable that Christ places the knowledge of and faith in Him not in any admiration of the creatures of nature nor in marvelling at any so-called dominion, over them, nor in signs and wonders, but in the witness of the Spirit. Spirit is infinitely high above Nature, in it the Divine Nature manifests itself more than in Nature.

But the form in which the universal content which is in and for itself, first belongs to Philosophy is the form of Thought, the form of the universal itself. In Religion, however, this content is for immediate and outward perception, and further for idea and sensation through art. The import is for the sensuous nature; it is the evidence of the Mind which comprehends that content. To make this clearer, the difference must be recollected between that which we are and have, and how we know the same — that is, in what manner we know it and have it as our object. This distinction is an infinitely important matter, and it alone is concerned in the culture of races and of individuals. We are men and have reason; what is human, or above all, what is rational vibrates within us, both in our feelings, mind and heart and in our subjective nature generally. It is in this corresponding vibration and in the

corresponding motion effected that a particular content becomes our own and is like our own. The manifold nature of the determinations which it contains is concentrated and wrapt up within this inward nature — an obscure motion of Mind in itself and in universal substantiality. The content is thus directly identical with the simple abstract certainty of ourselves and with self-consciousness. But Mind, because it is Mind, is as truly consciousness. What is confined within itself in its simplicity must be objective to itself and must come to be known. The whole difference lies in the manner and method of this objectivity, and hence in the manner and method of consciousness.

This method and manner extends from the simple expression of the dulness of mere feeling to the most objective form, to that which is in and for itself objective, to Thought. The most simple, most formal objectivity is the expression of a name for that feeling and for the state of mind according with it, as seen in these words, worship, prayer, etc. Such expressions as "Let us pray" and "Let us worship" are simply the recalling of that feeling. But "Let us think about God" brings with it something more; it expresses the absolutely embracing content of that substantial feeling, and the object, which differs from mere sensation as subjective self-conscious activity; or which is content distinguished from this activity as form. This object, however, comprehending in itself the whole substantial content, is itself still undeveloped and entirely undetermined. To develop that content, to comprehend, express and bring to consciousness its relations, is the commencement, creation and manifestation of Religion. The form in which this developed content first possesses objectivity is that of immediate perception, of sensuous idea or of a more defined idea deduced from natural, physical or mental manifestations and conditions.

Art brings about this consciousness, in that it gives permanence and cohesion to the fleeting visible appearance through which objectivity passes

in sensation. The shapeless, sacred stone, the mere place, or whatever it is to which the desire for objectivity first attaches itself, receives from art, form, feature, determinate character and content which can be known and which is now present for consciousness. Art has thus become the instructress of the people. This was the case with Homer and Hesiod for instance, who, according to Herodotus (II. 53), “Made the Greeks their Theogony,” because they elevated and consolidated ideas and traditions in unison with the spirit of the people, wherever and in whatever confusion they might be found, into definite images and ideas. This is not the art which merely gives expression in its own way to the content, already perfectly expressed, of a Religion which in thought, idea and words has already attained complete development; that is to say, which puts its matter into stone, canvas, or words as is done by modern art, which, in dealing either with religious or with historical objects, takes as its groundwork ideas and thoughts which are already there. The consciousness of this Religion is rather the product of thinking imagination, or of thought which comprehends through the organ of imagination alone and finds expression in its forms.

If the infinite Thought, the absolute Mind, has revealed and does reveal itself in true Religion, that in which it reveals itself is the heart, the representing consciousness and the understanding of what is finite. Religion is not merely directed to every sort of culture. “To the poor is the Gospel preached,” but it must as being Religion expressly directed towards heart and mind, enter into the sphere of subjectivity and consequently into the region of finite methods of representation. In the perceiving and, with reference to perceptions, reflecting consciousness, man possesses for the speculative relations belonging to the absolute, only finite relations, whether taken in an exact or in a symbolical sense, to serve him to comprehend and express those qualities and relationships of the infinite.

In Religion as the earliest and the immediate revelations of God, the form of representation and of reflecting finite thought cannot be the only form in which He gives existence to Himself in consciousness, but it must also appear in this form, for such alone is comprehensible to religious consciousness. To make this clearer, something must be said as to what is the meaning of comprehension. On the one hand, as has been remarked above, there is in it the substantial basis of content, which, coming to Mind as its absolute Being, affects it in its innermost, finds an answering chord, and thereby obtains from it confirmation. This is the first absolute condition necessary to comprehension; what is not implicitly there cannot come within it or be for it — that is, a content which is infinite and eternal. For the substantial as infinite, is just that which has no limitations in that to which it is related, for else it would be limited and not the true substantial. And Mind is that alone which is not implicit, which is finite and external; for what is finite and external is no longer what is implicit but what is for another, what has entered into a relation. But, on the other hand, because the true and eternal must be for Mind become known, that is, enter into finite consciousness, the Mind for which it is, is finite and the manner of its consciousness consists in the ideas and forms of finite things and relations. These forms are familiar and well known to consciousness, the ordinary mode of finality, which mode it has appropriated to itself, having constituted it the universal medium of its representation, into which everything that comes to consciousness must be resolved in order that it may have and know itself therein.

The assertion of Religion is that the manifestation of Truth which is revealed to us through it, is one which is given to man from outside, and on this account it is also asserted that man has humbly to assent to it, because human reason cannot attain to it by itself. The assertion of positive Religion is that its truths exist without having their source known, so that the content

as given, is one which is above and beyond reason. By means of some prophet or other divine instrument, the truth is made known: just as Ceres and Triptolemus who introduced agriculture and matrimony, for so doing were honoured by the Greeks, men have rendered thanks to Moses and to Mahomed. Through whatever individual the Truth may have been given, the external matter is historical, and this is indifferent to the absolute content and to itself, since the person is not the import of the doctrine. But the Christian Religion has this characteristic that the Person of Christ in His character of the Son of God, Himself partakes of the nature of God. If Christ be for Christians only a teacher like Pythagoras, Socrates or Columbus, there would be here no universal divine content, no revelation or knowledge imparted about the Nature of God, and it is regarding this alone that we desire to obtain knowledge.

Whatever stage it may itself have reached, the Truth must undoubtedly in the first place come to men from without as a present object, sensuously represented, just as Moses saw God in the fiery bush, and as the Greek brought the god into conscious being by means of sculpture or other representations. But there is the further fact, that neither in Religion nor in Philosophy does this external form remain, nor can it so remain. A form of the imagination or an historical form, such as Christ, must for the spirit be spiritual; and thus it ceases to be an external matter, seeing that the form of externality is dead. We must know God "in Spirit and in Truth." He is the absolute and actual Spirit. The relation borne by the human spirit to this Spirit involves the following considerations.

When man determines to adopt a Religion he asks himself, "What is the ground of my faith?" The Christian Religion replies— "The Spirit's witness to its content." Christ reproved the Pharisees for wishing to see miracles; the Spirit alone comprehends Spirit, the miracle is only a presentiment of that Spirit; and if the miracle be the suspension of natural laws, Spirit itself

is the real miracle in the operations of nature. Spirit in itself is merely this comprehension of itself. There is only one Spirit, the universal divine Spirit. Not that it is merely everywhere; it is not to be comprehended as what is common to everything, as an external totality, to be found in many or in all individuals, which are essentially individuals; but it must be understood as that which permeates through everything, as the unity of itself and of a semblance of its "other," as of the subjective and particular. As universal, it is object to itself, and thus determined as a particular, it is this individual: but as universal it reaches over this its "other," so that its "other" and itself are comprised in one. The true universality seems, popularly expressed, to be two — what is common to the universal itself and to the particular. A division is formed in the understanding of itself, and the Spirit is the unity of what is understood and the understanding person. The divine Spirit which is comprehended, is objective; the subjective Spirit comprehends. But Spirit is not passive, or else the passivity can be momentary only; there is one spiritual substantial unity. The subjective Spirit is the active, but the objective Spirit is itself this activity; the active subjective Spirit is that which comprehends the divine, and in its comprehension of it it is itself the divine Spirit. The relation of Spirit to self alone is the absolute determination; the divine Spirit lives in its own communion and presence. This comprehension has been called Faith, but it is not an historical faith; we Lutherans — I am a Lutheran and will remain the same — have only this original faith. This unity is not the Substance of Spinoza, but the apprehending Substance in self-consciousness which makes itself eternal and relates to universality. The talk about the limitations of human thought is futile; to know God is the only end of Religion. The testimony of the Spirit to the content of Religion is itself Religion; it is a testimony that both bears witness and at the same time is that witness. The Spirit proves itself,

and does so first in the proof; it is only proved because it proves itself and shows or manifests itself.

It has further to be said, that this testimony, this inward stirring and self-consciousness, reveals itself, while in the enshrouded consciousness of devotion it does not arrive at the proper consciousness of an object, but only at the consciousness of immersion in absolute Being. This permeating and permeated Spirit now enters into conception; God goes forth into the "other" and makes Himself objective. All that pertains to revelation and its reception, and which comes before us in mythology, here appears; everything which is historical and which belongs to what is positive has here its proper place. To speak more definitely, we now have the Christ who came into the world nearly two thousand years ago. But He says, "I am with you even unto the ends of the earth; where two or three are gathered together in My Name, there will I be in the midst." I shall not be seen of you in the flesh, but "The Spirit of Truth will guide you into all Truth." The external is not the true relation; it will disappear.

The two stages have here been given, the first of which is the stage of devotion, of worship, such as that reached in partaking of the Communion. That is the perception of the divine Spirit in the community in which the present, indwelling, living Christ as self-consciousness has attained to actuality. The second stage is that of developed consciousness, when the content becomes the object; here this present, indwelling Christ retreats two thousand years to a small corner of Palestine, and is an individual historically manifested far away at Nazareth or Jerusalem. It is the same thing in the Greek Religion where the god present in devotion changes into prosaic statues and marble; or in painting, where this externality is likewise arrived at, when the god becomes mere canvas or wood. The Supper is, according to the Lutheran conception, of Faith alone; it is a divine satisfaction, and is not adored as if it were the Host. Thus a sacred image is

no more to us than is a stone or thing. The second point of view must indeed be that with which consciousness begins; it must start from the external comprehension of this form: it must passively accept report and take it up into memory. But if it remain where it is, that is the unspiritual point of view; to remain fixed in this second standpoint in this dead far-away historic distance, is to reject the Spirit. The sins of him who lies against the Holy Ghost cannot be forgiven. That lie is the refusal to be a universal, to be holy, that is to make Christ become divided, separated, to make Him only another person as this particular person in Judea; or else to say that He now exists, but only far away in Heaven, or in some other place, and not in present actual form amongst His people. The man who speaks of the *merely* finite, of *merely* human reason, and of the limits to mere reason, lies against the Spirit, for the Spirit as infinite and universal, as self-comprehension, comprehends itself not in a "merely" nor in limits, nor in the finite as such. It has nothing to do with this, for it comprehends itself within itself alone, in its infinitude.

If it be said of Philosophy that it makes reality the subject of its knowledge, the principal point is that the reality should not be one outside of that of which it is the reality. For example, if from the real content of a book, I abstract the binding, paper, ink, language, the many thousand letters that are contained in it, the simple universal content as reality, is not outside of the book. Similarly law is not outside of the individual, but it constitutes the true Being of the individual. The reality of my Mind is thus in my Mind itself and not outside of it; it is my real Being, my own substance, without which I am without existence. This reality is, so to speak, the combustible material which may be kindled and lit up by the universal reality as such as objective; and only so far as this phosphorus is in men, is comprehension, the kindling and lighting up, possible. Feeling, anticipation, knowledge of

God, are only thus in men; without such, the divine Mind would not be the in and for itself Universal. Reality is itself a real content and not the destitute of content and undetermined; yet, as the book has other content besides, there is in the individual mind also a great amount of other matter which belongs only to the manifestation of this reality, and the individual surrounded with what is external, must be separated from this existence. Since reality is itself Spirit and not an abstraction, “God is not a God for the dead but for the living,” and indeed for living spirits.

The great Creator was alone
And experienced desire,
Therefore He created Spirits,
Holy mirrors of His holiness.
The noblest Being He found no equal;
From out the bowl of all the spiritual world,
There sparkled up to Him infinitude.

Religion is also the point of view from which this existence is known. But as regards the different forms of knowledge existing in Religion and Philosophy, Philosophy appears to be opposed to the conception in Religion that the universal mind first shows itself as external, in the objective mode of consciousness. Worship, commencing with the external, then turns against and abrogates it as has just been said, and thus Philosophy is justified through the acts and forms of worship, and only does what they do. Philosophy has to deal with two different objects; first as in the Religion present in worship, with the substantial content, the spiritual soul, and secondly with bringing this before consciousness as object, but in the form of thought. Philosophy thinks and conceives of that which Religion represents as the object of consciousness, whether it is as the work of the imagination or as existent facts in history. The form of the knowledge of the

object is, in religious consciousness, such as pertains to the ordinary idea, and is thus more or less sensuous in nature. In Philosophy we do not say that God begot a Son, which is a relation derived from natural life. Thought, or the substance of such a relation, is therefore still recognized in Philosophy. Since Philosophy thinks its object, it has the advantage of uniting the two stages of religious consciousness — which in Religion are different moments — into one unity in philosophic thought.

It is these two forms which are different from one another and which, as opposed, may therefore seem to be mutually conflicting; and it is natural and it necessarily seems to be the case, that on first definitely coming to view they are so to speak conscious of their diversity, and hence at first appear as inimical to one another. The first stage in the order of manifestation is definite existence, or a determinate Being-for-self as opposed to the other. The later form is that Thought embraces itself in the concrete, immerses itself in itself, and Mind, as such, comes in it to consciousness. In the earlier stage, Mind is abstract, and in this constraint it knows itself to be different, and in opposition to the other. When it embraces itself in the concrete, it is no more simply confined in determinate existence, only knowing or possessing itself in that diversity, but it is the Universal which, inasmuch as it determines itself, contains its "other" within itself. As concrete intelligence, Mind thus comprehends the substantial in the form which seemed to differ from it, of which it had only grasped the outward manifestation and had turned away from it; it recognizes itself in its inward content, and so it for the first time grasps its object, and deals justice to its opposite.

Generally speaking, the course of this antithesis in history is that Thought first of all comes forth within Religion, as not free and in separate manifestations. Secondly, it strengthens itself, feels itself to be resting upon itself, holds and conducts itself inimically towards the other form, and does

not recognize itself therein. In the third place, it concludes by acknowledging itself as in this other. Or else Philosophy has to begin with carrying on its work entirely on its own account, isolating Thought from all popular beliefs, and taking for itself quite a different field of operation, a field for which the world of ordinary ideas lies quite apart, so that the two exist peacefully side by side, or, to put it better, so that no reflection on their opposition is arrived at. Just as little did the thought of reconciling them occur, since in the popular beliefs the same content appeared as in any external form other than the notion — the thought that is, of explaining and justifying popular belief, in order thus to be able again to express the conceptions of free thought in the form of popular religion.

Thus we see Philosophy first restrained and confined within the range of the Greek heathen world; then resting upon itself, it goes forth against popular religion and takes up an unfriendly attitude to it, until it grasps that religion in its innermost and recognizes itself therein. Thus the ancient Greek philosophers generally respected the popular religion, or at least they did not oppose it, or reflect upon it. Those coming later, including even Xenophanes, handled popular ideas most severely, and thus many so-called atheists made their appearance. But as the spheres of popular conception, and abstract thought stood peacefully side by side, we also find Greek philosophers of even a later period in development, in whose case speculative thought and the act of worship, as also the pious invocation upon and sacrifice to the gods, coexist in good faith, and not in mere hypocrisy. Socrates was accused of teaching other gods than those belonging to the popular religion; his *δαιμόνιον* was indeed opposed to the principles of Greek morals and religion, but at the same time he followed quite honestly the usages of his religion, and we know besides that his last request was to ask his friends to offer a cock to Æsculapius — a desire quite inconsistent with his conclusions regarding the existence of God and above

all regarding morality. Plato declaimed against the poets and their gods. It was in a much later time that the Neo-platonists first recognized in the popular mythology rejected earlier by the philosophers, the universal content; they transposed and translated it into what is significant for thought, and thus used mythology itself as a symbolical imagery for giving expression to their formulas.

Similarly do we see in the Christian Religion, thought which is not independent first placing itself in conjunction with the form belonging to this Religion and acting within it — that is to say, taking the Religion as its groundwork, and proceeding from the absolute assumption of the Christian doctrine. We see later on the opposition between so-called faith and so-called reason; when the wings of thought have become strengthened, the young eaglet flies away for himself to the sun of Truth; but like a bird of prey he turns upon Religion and combats it. Latest of all Philosophy permits full justice to be done to the content of Religion through the speculative Notion, which is through Thought itself. For this end the Notion must have grasped itself in the concrete and penetrated to concrete spirituality. This must be the standpoint of the Philosophy of the present time; it has begun within Christianity and can have no other content than the world-spirit. When that spirit comprehends itself in Philosophy, it also comprehends itself in that form which formerly was inimical to Philosophy.

Thus Religion has a content in common with Philosophy the forms alone being different; and the only essential point is that the form of the Notion should be so far perfected as to be able to grasp the content of Religion. The Truth is just that which has been called the mysteries of Religion. These constitute the speculative element in Religion such as were called by the Neo-platonists *μυεῖν, μυεῖσθαι* (being initiated), or being occupied with speculative Notions. By mysteries is meant, superficially speaking, the secret, what remains such and does not arrive at being known. But in the

Eleusinian mysteries there was nothing unknown; all Athenians were initiated into them, Socrates alone shut himself out. Openly to make them known to strangers was the one thing forbidden, as indeed it was made a crime in the case of certain people. Such matters however, as being holy, were not to be spoken of. Herodotus often expressly says (e.g. ii. 45-47) that he would speak of the Egyptian Divinities and mysteries in as far as it was pious so to do: he knew more, but it would be impious to speak of them. In the Christian Religion dogmas are called mysteries. They are that which man knows about the Nature of God. Neither is there anything mysterious in this; it is known by all those who are partakers in that Religion, and these are thus distinguished from the followers of other Religions. Hence mystery here signifies nothing unknown, since all Christians are in the secret. Mysteries are in their nature speculative, mysterious certainly to the understanding, but not to reason; they are rational, just in the sense of being speculative. The understanding does not comprehend the speculative which simply is the concrete because it holds to the differences in their separation; their contradiction is indeed contained in the mystery, which, however, is likewise the resolution of the same.

Philosophy, on the contrary, is opposed to the so-called Rationalism of the new Theology which for ever keeps reason on its lips, but which is dry understanding only; no reason is recognizable in it as the moment of independent thought which really is abstract thought and that alone. When the understanding which does not comprehend the truths of Religion, calls itself the illuminating reason and plays the lord and master, it goes astray. Rationalism is opposed to Philosophy in content and form, for it has made the content empty as it has made the heavens, and has reduced all that is, to finite relations — in its form it is a reasoning process which is not free and which has no conceiving power. The supernatural in Religion is opposed to rationalism, and if indeed the latter is related in respect of the real content to

Philosophy, yet it differs from it in form, for it has become unspiritual and wooden, looking for its justification to mere external authority. The scholastics were not supernaturalists in this sense; they knew the dogmas of the Church in thought and in conception. If Religion in the inflexibility of its abstract authority as opposed to thought, declares of it that "the gates of Hell shall not triumph over it," the gates of reason are stronger than the gates of Hell, not to overcome the Church but to reconcile itself to the Church. Philosophy, as the conceiving thought of this content, has as regards the idea of Religion, the advantage of comprehending both sides — it comprehends Religion and also comprehends both rationalism and supernaturalism and itself likewise. But this is not the case on the other side. Religion from the standpoint of idea, comprehends only what stands on the same platform as itself, and not Philosophy, the Notion, the universal thought determinations. Often no injustice is done to a Philosophy when its opposition to Religion has been made matter of reproach; but often, too, a wrong has been inflicted where this is done from the religious point of view.

The form of Religion is necessary to Mind as it is in and for itself; it is the form of truth as it is for all men, and for every mode of consciousness. This universal mode is first of all for men in the form of sensuous consciousness, and then, secondly, in the intermingling of the form of the universal with sensuous manifestation or reflection — the representing consciousness, the mythical, positive and historical form, is that pertaining to the understanding. What is received in evidence of Mind only becomes object to consciousness when it appears in the form of the understanding, that is to say, consciousness must first be already acquainted with these forms from life and from experience. Now, because thinking consciousness is not the outward universal form for all mankind, the consciousness of the true, the spiritual and the rational, must have the form of Religion, and this is the universal justification of this form.

We have here laid down the distinction between Philosophy and Religion, but taking into account what it is we wish to deal with in the history of Philosophy, there is something still which must be remarked upon, and which partly follows from what has been already said. There is the question still confronting us as to what attitude we must take in reference to this matter in the history of Philosophy.

β. The religious element to be excluded from the content of the History of Philosophy.

αα. Mythology first meets us, and it seems as if it might be drawn within the history of Philosophy. It is indeed a product of the imagination, but not of caprice, although that also has its place here. But the main part of mythology is the work of the imaginative reason, which makes reality its object, but yet has no other means of so doing, than that of sensuous representation, so that the gods make their appearance in human guise. Mythology can now be studied for art, &c. But the thinking mind must seek out the substantial content, the thought and the theory implicitly contained therein, as reason is sought in Nature. This mode of treating mythology was that of the Neo-platonists; in recent times it has for the most part become the work of my friend Creuzer in symbolism. This method of treatment is combated and condemned by others. Man, it is said, must set to work historically alone, and it is not historic when a theory unthought of by the ancients, is read into a myth, or brought out of it. In one light, this is quite correct, for it points to a method adopted by Creuzer, and also by the Alexandrians who acted in a similar way. In conscious thought the ancients had not such theories before them, nor did anyone maintain them, yet to say that such content was not implicitly present, is an absurd contention. As the products of reason, though not of thinking reason, the religions of the people, as also the mythologies, however simple and even foolish they may appear, indubitably contain as genuine works of art, thoughts, universal

determinations and truth, for the instinct of reason is at their basis. Bound up with this is the fact that since mythology in its expression takes sensuous forms, much that is contingent and external becomes intermingled, for the representation of the Notion in sensuous forms always possesses a certain incongruity, seeing that what is founded on imagination cannot express the Idea in its real aspect. This sensuous form produced as it is by an historic or natural method, must be determined on many sides, and this external determination must, more or less, be of such a nature as not to express the Idea. It may also be that many errors are contained in that explanation, particularly when a single one is brought within our notice; all the customs, actions, furnishings, vestments, and offerings taken together, may undoubtedly contain something of the Idea in analogy, but the connection is far removed, and many contingent circumstances must find their entrance. But that there is a Reason there, must certainly be recognized, and it is essential so to comprehend and grasp mythology.

But Mythology must remain excluded from our history of Philosophy. The reason of this is found in the fact that in Philosophy we have to do not with theorems generally, or with thoughts which only are *implicite* contained in some particular form or other, but with thoughts which are explicit, and only in so far as they are explicit and in so far as a content such as that belonging to Religion, has come to consciousness in the form of Thought. And this is just what forms the immense distinction which we saw above, between capacity and actuality. The theorems which are *implicite* contained within Religion do not concern us; they must be in the form of thoughts, since Thought alone is the absolute form of the Idea.

In many mythologies, images are certainly used along with their significance, or else the images are closely attended by their interpretation. The ancient Persians worshipped the sun, or fire, as being the highest existence; the first cause in the Persian Religion is Zervane Akerene —

unlimited time, eternity. This simple eternal existence possesses according to Diogenes Lærtius (I. 8), "the two principles Ormuzd (*Ὠρομάσδης*) and Ahriman (*Ἀρειμάνος*), the rulers over good and evil." Plutarch in writing on Isis and Osiris (T. II. p. 369, ed. Xyl.) says, "It is not one existence which holds and rules the whole, but good is mingled with evil; nature as a rule brings forth nothing pure and simple; it is not one dispenser, who, like a host, gives out and mixes up the drink from two different barrels. But through two opposed and inimical principles of which the one impels towards what is right, and the other in the opposite direction, if not the whole world, at least this earth is influenced in different ways. Zoroaster has thus emphatically set up the one principle (Ormuzd) as being the Light, and the other (Ahriman) as the Darkness. Between the two (*μέσος δὲ ἀμφοῖν*) is Mithra, hence called by the Persians the Mediator (*μεσίτης*)." Mithra is then likewise substance, the universal existence, the sun raised to a totality. It is not the mediator between Ormuzd and Ahriman by establishing peace and leaving each to remain as it was; it does not partake of good and evil both, like an unblest middle thing, but it stands on the side of Ormuzd and strives with him against the evil. Ahriman is sometimes called the first-born son of the Light, but Ormuzd only remained within the Light. At the creation of the visible world, Ormuzd places on the earth in his incomprehensible kingdom of Light, the firm arches of the heavens which are above yet surrounded on every side with the first original Light. Midway to the earth is the high hill Albordi, which reaches into the source of Light. Ormuzd's empire of Light extended uninterruptedly over the firm vault of the heavens and the hill Albordi, and over the earth too, until the third age was reached. Then Ahriman, whose kingdom of night was formerly bound beneath the earth, broke in upon Ormuzd's corporeal world and ruled in common with him. Now the space between heaven and earth was divided into light and night. As Ormuzd had formerly only a spiritual

kingdom of light, Ahriman had only one of night, but now that they were intermingled he placed the terrestrial light thus created in opposition to the terrestrial night. From this time on, two corporeal worlds stand opposed, one pure and good, and one impure and evil, and this opposition permeates all nature. On Albordi, Ormuzd created Mithra as mediator for the earth. The end of the creation of the bodily world is none other than to reinstate existence, fallen from its creator, to make it good again, and thus to make the evil disappear for ever. The bodily world is the battle-ground between good and evil; but the battle between light and darkness is not in itself an absolute and irreconcilable opposition, but one which can be conquered, and in it Ormuzd, the principle of Light, will be the conqueror.

I would remark of this, that when we consider the elements in these ideas which bear some further connection with Philosophy, the universal of that duality with which the Notion is necessarily set forth can alone be interesting and noteworthy to us; for in it the Notion is just the immediate opposite of itself, the unity of itself with itself in the "other:" a simple existence in which absolute opposition appears as the opposition of existence, and the sublation of that opposition. Because properly the Light principle is the only existence of both, and the principle of Darkness is the null and void, — the principle of Light identifies itself with Mithra, which was before called the highest existence. The opposition has laid aside the appearance of contingency, but the spiritual principle is not separate from the physical, because the good and evil are both determined as Light and Darkness. We thus here see thought breaking forth from actuality, and yet not such a separation as only takes place in Religion, when the supersensuous is itself again represented in a manner sensuous, notionless and dispersed, for the whole of what is dispersed in sensuous form is gathered together in the one single opposition, and activity is thus simply represented. These determinations lie much nearer to Thought; they are not

mere images or symbols, but yet these myths do not concern Philosophy. In them Thought does not take the first place, for the myth-form remains predominant. In all religions this oscillation between form and thought is found, and such a combination still lies outside Philosophy.

This is also so in the Sanchuniathonic Cosmogony of the Phœnicians. These fragments, which are found in Eusebius (Præpar. Evang. I. 10), are taken from the translation of the Sanchuniathon from Phœnician into Greek made by a Grammarian named Philo from Biblus. Philo lived in the time of Vespasian and ascribes great antiquity to the Sanchuniathon. It is there said, "The principles of things are found in Chaos, in which the elements exist undeveloped and confused, and in a Spirit of Air. The latter permeated the chaos, and with it engendered a slimy matter or mud (*ἰλύν*) which contained within it the living forces and the germs of animals. By mingling this mud with the component matter of chaos and the resulting fermentation, the elements separated themselves. The fire elements ascended into the heights and formed the stars. Through their influence in the air, clouds were formed and the earth was made fruitful. From the mingling of water and earth, through the mud converted into putrefying matter, animals took their origin as imperfect and senseless. These again begot other animals perfect and endowed with senses. It was the crash of thunder in a thunder-storm that caused the first animals still sleeping in their husks to waken up to life."[7]

The fragments of Berosus of the Chaldeans were collected from Josephus, Syncellus and Eusebius under the title *Berosi Chaldaica*, by Scaliger, as an appendix to his work *De emendatione temporum*, and they are found complete in the Greek Library of Fabricius (T. xiv. pp. 175-211). Berosus lived in the time of Alexander, is said to have been a Priest of Bel and to have drawn upon the archives of the temple at Babylon. He says, "The original god is Bel and the goddess Omoroka (the sea), but beside them there were yet other gods. Bel divided Omoroka in two, in order to

create from her parts heaven and earth. Hereupon he cut off his own head and the human race originated from the drops of his divine blood. After the creation of man, Bel banished the darkness, divided heaven and earth, and formed the world into its natural shape. Since certain parts of the earth seemed to him to be insufficiently populated, he compelled another god to lay hands upon himself, and from his blood more men and more kinds of animals were created. At first the men lived a wild and uncultivated life, until a monster" (called by Berosus, Oannes) "joined them into a state, taught them arts and sciences, and in a word brought Humanity into existence. The monster set about this end with the rising of the sun out of the sea, and with its setting he again hid himself under the waves."

ββ. What belongs to Mythology may in the second place make a pretence of being a kind of Philosophy. It has produced philosophers who availed themselves of the mythical form in order to bring their theories and systems more prominently before the imagination, for they made the thoughts the content of the myth. But the myth is not a mere cloak in the ancient myths; it is not merely that the thoughts were there and were concealed. This may happen in our reflecting times; but the first poetry does not start from a separation of prose and poetry. If philosophers used myths, it was usually the case that they had the thoughts and then sought for images appropriate to them; Plato has many beautiful myths of this kind. Others likewise have spoken in myths, as for example, Jacobi, whose Philosophy took the form of the Christian Religion, through which he gave utterance to matter of a highly speculative nature. But this form is not suitable to Philosophy. Thought which has itself as object, must have raised itself to its own form, to the form of thought. Plato is often esteemed on account of his myths; he is supposed to have evinced by their means greater genius than other philosophers were capable of. It is contended here that the myths of Plato are superior to the abstract form of expression, and Plato's method of

representation is certainly a wonderful one. On closer examination we find that it is partly the impossibility of expressing himself after the manner of pure thought that makes Plato put his meaning so, and also such methods of expression are only used by him in introducing a subject. When he comes to the matter in point, Plato expresses himself otherwise, as we see in the Parmenides, where simple thought determinations are used without imagery. Externally these myths may certainly serve when the heights of speculative thought are left behind, in order to present the matter in an easier form, but the real value of Plato does not rest in his myths. If thought once attains power sufficient to give existence to itself within itself and in its element, the myth becomes a superfluous adornment, by which Philosophy is not advanced. Men often lay hold of nothing but these myths. Hence Aristotle has been misunderstood just because he intersperses similes here and there; the simile can never be entirely in accord with thought, for it always carries with it something more. The difficulty of representing thoughts as thoughts always attaches to the expedient of expression in sensuous form. Thought, too, ought not to be concealed by means of the myth, for the object of the mythical is just to give expression to and to reveal thought. The symbol is undoubtedly insufficient for this expression; thought concealed in symbols is not yet possessed, for thought is self-revealing, and hence the myth does not form a medium adequate for its conveyance. Aristotle (Metaph. III. 4) says, “It is not worth while to treat seriously of those whose philosophy takes a mythical form.” Such is not the form in which thought allows itself to be stated, but only is a subordinate mode.

Connected with this, there is a similar method of representing the universal content by means of numbers, lines and geometric figures. These are figurative, but not concretely so, as in the case of myths. Thus it may be said that eternity is a circle, the snake that bites its own tail. This is only an

image, but Mind does not require such a symbol. There are people who value such methods of representation, but these forms do not go far. The most abstract determinations can indeed be thus expressed, but any further progress brings about confusion. Just as the freemasons have symbols which are esteemed for their depth of wisdom — depth as a brook is deep when one cannot see the bottom — that which is hidden very easily seems to men deep, or as if depth were concealed beneath. But when it is hidden, it may possibly prove to be the case that there is nothing behind. This is so in freemasonry, in which everything is concealed to those outside and also to many people within, and where nothing remarkable is possessed in learning or in science, and least of all in Philosophy. Thought is, on the contrary, simply its manifestation; clearness is its nature and itself. The act of manifestation is not a condition which may be or may not be equally, so that thought may remain as thought when it is not manifested, but its manifestation is itself, its Being. Numbers, as will be remarked in respect of the Pythagoreans, are unsuitable mediums for expressing thoughts; thus *μονάς*, *δυάς*, *τριάς* are, with Pythagoras, unity, difference, and unity of the unity and of the difference. The two first of the three are certainly united by addition; this kind of union is, however, the worst form of unity. In Religion the three make their appearance in a deeper sense as the Trinity, and in Philosophy as the Notion, but enumeration forms a bad method of expression. There is the same objection to it as would exist to making the mensuration of space the medium for expressing the absolute. People also quote the Philosophy of the Chinese, of the Foï, in which it is said that thoughts are represented by numbers. Yet the Chinese have explained their symbols and hence have made their meaning evident. Universal simple abstractions have been present to all people who have arrived at any decree of culture.

γγ. We have still to remark in the third place, that Religion, as such, does not merely form its representations after the manner of art; and also that Poetry likewise contains actual thoughts. In the case of the poets whose art has speech as medium, we find all through deep universal thought regarding reality; these are more explicitly expressed in the Indian Religion, but with the Indians everything is mixed up. Hence it is said that such races have also had a Philosophy proper to themselves; but the universal thoughts of interest in Indian books limit themselves to what is most abstract, to the idea of rising up and passing away, and thus of making a perpetual round. The story of the Phœnix is well known as an example of this; it is one which took its origin in the East. We are able similarly to find thoughts about life and death and of the transition of Being into passing away; from life comes death and from death comes life; even in Being, in what is positive, the negation is already present. The negative side must indeed contain within it the positive, for all change, all the process of life is founded on this. But such reflections only occasionally come forth; they are not to be taken as being proper philosophic utterances. For Philosophy is only present when thought, as such, is made the absolute ground and root of everything else, and in these modes of representation this is not so.

Philosophy does not reflect on any particular thing or object already existing as a first substratum; its content is just Thought, universal thought which must plainly come first of all; to put it otherwise, the Absolute must in Philosophy be in the form of thought. In the Greek Religion we find the thought-determination "eternal necessity;" which means an absolute and clearly universal relation. But such thought has other subjects besides; it only expresses a relation, the necessity to be the true and all-embracing Being. Thus neither must we take this form into our consideration. We might speak in that way of a philosophy of Euripides, Schiller or Goethe. But all such reflection respecting, or general modes of representing what is

true, the ends of men, morality and so on, are in part only incidentally set forth, and in part they have not reached the proper form of thought, which implies that what is so expressed must be ultimate, thus constituting the Absolute.

γ. Particular theories found in Religion.

In conclusion, the philosophy which we find within Religion does not concern us. We find deep, speculative thoughts regarding the nature of God not only in the Indian Religions, but also in the Fathers and the Schoolmen. In the history of dogmatism there is a real interest in becoming acquainted with these thoughts, but they do not belong to the history of Philosophy. Nevertheless more notice must be taken of the Schoolmen than of the Fathers, for they were certainly great philosophers to whom the culture of Christendom owes much. But their speculations belong in part to other philosophies such as to that of Plato, which must in so far be considered for themselves; partly, too, they emanate from the speculative content of Religion itself which already exists as independent truth in the doctrine of the Church, and belongs primarily to faith. Thus such modes of thought rest on an hypothesis and not on Thought itself; they are not properly speaking themselves Philosophy or thought which rests on itself, but as ideas already firmly rooted, they act on its behalf either in refuting other ideas and conclusions or in philosophically vindicating against them their own religious teaching. Thought in this manner does not represent and know itself as the ultimate and absolute culmination of the content, or as the inwardly self-determining Thought. Hence, too, when the Fathers, seeing that the content of the Christian Religion can only be grasped after the speculative form, did, within the teaching of the Church, produce thoughts of a highly speculative nature, the ultimate justification of these was not found in Thought as such, but in the teaching of the Church. Philosophic teaching here finds itself within a strongly bound system and not as thought

which emanates freely from itself. Thus with the scholastics, too, Thought does not construct itself out of itself, but depends upon hypotheses; and although it ever rests more and more upon itself, it never does so in opposition to the doctrine of the Church. Both must and do agree, since Thought has to prove from itself what the Church has already verified.

c. *Philosophy proper distinguished from Popular Philosophy.*

Of the two departments of knowledge allied to Philosophy we found that the one, that of the special sciences, could not be called a philosophy in that it, as independent seeing and thinking immersed in finite matter, and as the active principle in becoming acquainted with the finite, was not the content, but simply the formal and subjective moment. The second sphere, Religion, is deficient in that it only had the content or the objective moment in common with Philosophy. In it independent thought was an essential moment, since the subject had an imaginary or historical form. Philosophy demands the unity and intermingling of these two points of view; it unites the Sunday of life when man in humility renounces himself, and the working-day when he stands up independently, is master of himself and considers his own interests. A third point of view seems to unite both elements, and that is popular Philosophy. It deals with universal objects and philosophizes as to God and the world; and thought is likewise occupied in learning about these matters. Yet this Philosophy must also be cast aside. The writings of Cicero may be put under this category; they contain a kind of philosophy that has its own place and in which excellent things are said. Cicero formed many experiences both in the affairs of life and mind, and from them and after observing what takes place in the world, he deduced the truth. He expresses himself with culture on the concerns most important to man, and hence his great popularity. Fanatics and mystics may from another point of view be reckoned as in this category. They give expression to a deep sense of devotion, and have had experiences in the higher regions.

They are able to express the highest content, and the result is attractive. We thus find the brightest gleams of thought in the writings of a Pascal — as we do in his *Pensées*.

But the drawback that attaches to this Philosophy is that the ultimate appeal — even in modern times — is made to the fact that men are constituted such as they are by nature, and with this Cicero is very free. Here the moral instinct comes into question, only under the name of feeling; Religion now rests not on what is objective but on religious feeling, because the immediate consciousness of God by men is its ultimate ground. Cicero makes copious use of the *consensus gentium*; in more modern times this appeal has been more or less left alone, since the individual subject has to rest upon himself. Feeling is first of all laid hold of, then comes reasoning from what is given, but in these we can appeal to what is immediate only. Independent thought is certainly here advanced; the content too, is taken from the self; but we must just as necessarily exclude this mode of thinking from Philosophy. For the source from which the content is derived is of the same description as in the other cases. Nature is the source in finite sciences, and in Religion it is Spirit; but here the source is in authority; the content is given and the act of worship removes but momentarily this externality. The source of popular Philosophy is in the heart, impulses and capacities, our natural Being, my impression of what is right and of God; the content is in a form which is of nature only. I certainly have everything in feeling, but the whole content is also in Mythology, and yet in neither is it so in veritable form. The laws and doctrines of Religion are that in which this content always comes to consciousness in a more definite way, while in feeling there still is intermingled the arbitrary will of that which is subjective.

3. Commencement of Philosophy and of its History.

Now that we have thus defined the Notion of Philosophy to be the Thought which, as the universal content, is complete Being, it will be shown in the history of Philosophy how the determinations in this content make their appearance little by little. At first we only ask where Philosophy and its History begin.

a. Freedom of Thought as a first condition.

The general answer is in accordance with what has been said. Philosophy begins where the universal is comprehended as the all-embracing existence, or where the existent is laid hold of in a universal form, and where thinking about thought first commences. Where, then, has this occurred? Where did it begin? That is a question of history. Thought must be for itself, must come into existence in its freedom, liberate itself from nature and come out of its immersion in mere sense-perception; it must as free, enter within itself and thus arrive at the consciousness of freedom. Philosophy is properly to be commenced where the Absolute is no more in the form of ordinary conception, and free thought not merely thinks the Absolute but grasps its Idea. That is to say where Thought grasps as Thought, the Being (which may be Thought itself), which it recognizes as the essence of things, the absolute totality and the immanent essence of everything, and does so as an external Being. The simple existence which is not sensuous and which the Jews thought of as God (for all Religion is thinking), is thus not a subject to be treated of by Philosophy, but just such a proposition as that "The existence or principle of things is water, fire or thought."

Thought, this universal determination which sets forth itself, is an abstract determinateness; it is the beginning of Philosophy, but this beginning is at the same time in history, the concrete form taken by a people, the principle of which constitutes what we have stated above. If we say that the consciousness of freedom is connected with the appearance of Philosophy, this principle must be a fundamental one with those with whom

Philosophy begins; a people having this consciousness of freedom founds its existence on that principle seeing that the laws and the whole circumstances of the people are based only on the Notion that Mind forms of itself, and in the categories which it has. Connected with this on the practical side, is the fact that actual freedom develops political freedom, and this only begins where the individual knows himself as an independent individual to be universal and real, where his significance is infinite, or where the subject has attained the consciousness of personality and thus desires to be esteemed for himself alone. Free, philosophic thought has this direct connection with practical freedom, that as the former supplies thought about the absolute, universal and real object, the latter, because it thinks itself, gives itself the character of universality. Thinking means the bringing of something into the form of universality; hence Thought first treats of the universal, or determines what is objective and individual in the natural things which are present in sensuous consciousness, as the universal, as an objective Thought. Its second attribute is that in recognizing and knowing this objective and infinite universal, I, at the same time, remain confronting it from the standpoint of objectivity.

On account of this general connection between political freedom and the freedom of Thought, Philosophy only appears in History where and in as far as free institutions are formed. Since Mind requires to separate itself from its natural will and engrossment in matter if it wishes to enter upon Philosophy, it cannot do so in the form with which the world-spirit commences and which takes precedence of that separation. This stage of the unity of Mind with Nature which as immediate is not the true and perfect state, is mainly found in the Oriental conception of existence, therefore Philosophy first begins in the Grecian world.

b. *Separation of the East and its Philosophy.*

Some explanations have to be given regarding this first form. Since Mind in it, as consciousness and will, is but desire, self-consciousness still stands upon its first stage in which the sphere of its idea and will is finite. As intelligence is thus finite too, its ends are not yet a universal for themselves; but if a people makes for what is moral, if laws and justice are possessed, the character of universality underlies its will. This presupposes a new power in Mind with which it commences to be free, for the universal will as the relation of thought to thought or as the universal, contains a thought which is at home with itself. If a people desire to be free, they will subordinate their desires to universal laws, while formerly that which was desired was only a particular. Now finitude of the will characterizes the orientals, because with them the will has not yet grasped itself as universal, for thought is not yet free for itself. Hence there can but be the relation of lord and slave, and in this despotic sphere fear constitutes the ruling category. Because the will is not yet free from what is finite, it can therein be comprehended and the finite can be shown forth as negative. This sensation of negation, that something cannot last, is just fear as distinguished from freedom which does not consist in being finite but in being for itself, and this cannot be laid hold of. Religion necessarily has this character, since the fear of the Lord is the essential element beyond which we cannot get. "The fear of the Lord is the beginning of wisdom" is indeed a true saying; man must begin with this in order to know the finite ends in their negative character. But man must also have overcome fear through the relinquishment of finite ends, and the satisfaction which that Religion affords is confined to what is finite, seeing that the chief means of reconciliation are natural forms which are impersonated and held in reverence.

The oriental consciousness raises itself, indeed, above the natural content to what is infinite; but it only knows itself as accidental in reference to the

power which makes the individual fear. This subordination may take two forms and must indeed from one extreme pass to the other. The finite, which is for consciousness, may have the form of finitude as finite, or it may become the infinite, which is however an abstraction. The man who lives in fear, and he who rules over men through fear, both stand upon the same platform; the difference between them is only in the greater power of will which can go forth to sacrifice all that is finite for some particular end. The despot brings about what his caprice directs, including certainly what is good, not as law, but as arbitrary will: the passive will, like that of slavery, is converted into the active energy of will, which will, however, is arbitrary still. In Religion we even find self-immersion in the deepest sensuality represented as the service of God, and then there follows in the East a flight to the emptiest abstraction as to what is infinite, as also the exaltation attained through the renunciation of everything, and this is specially so amongst the Indians, who torture themselves and enter into the most profound abstraction. The Indians look straight before them for ten years at a time, are fed by those around, and are destitute of other spiritual content than that of knowing what is abstract, which content therefore is entirely finite. This, then, is not the soil of freedom.

In the East, Mind indeed begins to dawn, but it is still true of it that the subject is not presented as a person, but appears in the objectively substantial, which is represented as partly supersensuous and partly, and even more, material, as negative and perishing. The highest point attainable by the individual, the everlasting bliss, is made an immersion into substance, a vanishing away of consciousness, and thus of all distinction between substance and individuality — hence an annihilation. A spiritually dead relation thus comes into existence, since the highest point there to be reached is insensibility. So far, however, man has not attained that bliss, but finds himself to be a single existent individual, distinguished from the

universal substance. He is thus outside the unity, has no significance, and as being what is accidental and without rights, is finite only; he finds himself limited through Nature — in caste for instance. The will is not here the substantial will; it is the arbitrary will given up to what is outwardly and inwardly contingent, for substance alone is the affirmative. With it greatness, nobility, or exaltitude of character, are certainly not excluded, but they are only present as the naturally determined or the arbitrary will, and not in the objective forms of morality and law to which all owe respect, which hold good for all, and in which for that same reason all are recognized. The oriental subject thus has the advantage of independence, since there is nothing fixed; however undetermined is the substance of the Easterns, as undetermined, free and independent may their character be. What for us is justice and morality is also in their state, but in a substantial, natural, patriarchal way, and not in subjective freedom. Conscience does not exist nor does morality. Everything is simply in a state of nature, which allows the noblest to exist as it does the worst.

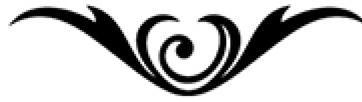
The conclusion to be derived from this is that no philosophic knowledge can be found here. To Philosophy belongs the knowledge of Substance, the absolute Universal, that whether I think it and develop it or not, confronts me still as for itself objective; and whether this is to me substantial or not, still just in that I think it, it is mine, that in which I possess my distinctive character or am affirmative: thus my thoughts are not mere subjective determinations or opinions, but, as being my thoughts, are also thoughts of what is objective, or they are substantial thoughts. The Eastern form must therefore be excluded from the History of Philosophy, but still, upon the whole, I will take some notice of it. I have touched on this elsewhere,[8] for some time ago we for the first time reached a position to judge of it. Earlier a great parade was made about the Indian wisdom without any real

knowledge of what it was; now this is for the first time known, and naturally it is found to be in conformity with the rest.

c. *Beginnings of Philosophy in Greece.*

Philosophy proper commences in the West. It is in the West that this freedom of self-consciousness first comes forth; the natural consciousness, and likewise Mind disappear into themselves. In the brightness of the East the individual disappears; the light first becomes in the West the flash of thought which strikes within itself, and from thence creates its world out of itself. The blessedness of the West is thus so determined that in it the subject as such endures and continues in the substantial; the individual mind grasps its Being as universal, but universality is just this relation to itself. This being at home with self, this personality and infinitude of the "I" constitutes the Being of Mind; it is thus and can be none else. For a people to know themselves as free, and to be only as universal, is for them to be; it is the principle of their whole life as regards morality and all else. To take an example, we only know our real Being in so far as personal freedom is its first condition, and hence we never can be slaves. Were the mere arbitrary will of the prince a law, and should he wish slavery to be introduced, we would have the knowledge that this could not be. To sleep, to live, to have a certain office, is not our real Being, and certainly to be no slave is such, for that has come to mean the being in nature. Thus in the West we are upon the soil of a veritable Philosophy.

Because in desire I am subject to another, and my Being is in a particularity, I am, as I exist, unlike myself; for I am "I," the universal complete, but hemmed in by passion. This last is self-will or formal freedom, which has desire as content. Amongst the Greeks we first find the freedom which is the end of true will, the equitable and right, in which I am free and universal, and others, too, are free, are also "I" and like me; where a relationship between free and free is thus established with its actual laws,



determinations of the universal will, and justly constituted states. Hence it is here that Philosophy began.

In Greece we first see real freedom flourish, but still in a restricted form, and with a limitation, since slavery was still existent, and the states were by its means conditioned. In the following abstractions we may first of all superficially describe the freedom of the East, of Greece, and of the Teutonic world. In the East only one individual is free, the despot; in Greece the few are free; in the Teutonic world the saying is true that all are free, that is, man is free as man. But since the one in Eastern countries cannot be free because that would necessitate the others also being free to him, impulse, self-will, and formal freedom, can there alone be found. Since in Greece we have to deal with the particular, the Athenians, and the Spartans, are free indeed, but not the Messenians or the Helots. The principle of the "few" has yet to be discovered, and this implies some modifications of the Greek point of view which we must consider in connection with the History of Philosophy. To take these into consideration means simply to proceed to the dividing up of Philosophy.

C

Division, Sources, and Method adopted in treating of the History of Philosophy.

1. Division of the History of Philosophy.

SINCE WE SET to work systematically this division must present itself as necessary. Speaking generally, we have properly only two epochs to distinguish in the history of Philosophy, as in ancient and modern art — these are the Greek and the Teutonic. The Teutonic Philosophy is the Philosophy within Christendom in so far as it belongs to the Teutonic nations; the Christian-European people, inasmuch as they belong to the world of science, possess collectively Teutonic culture; for Italy, Spain, France, England, and the rest, have through the Teutonic nations, received a new form. The influence of Greece also reaches into the Roman world, and hence we have to speak of Philosophy in the territory of the Roman world; but the Romans produced no proper Philosophy any more than any proper poets. They have only received from and imitated others, although they have often done this with intelligence; even their religion is derived from the Greek, and the special character that it has, makes no approach to Philosophy and Art, but is unphilosophical and inartistic.

A further description of these two outstanding opposites must be given. The Greek world developed thought as far as to the Idea; the Christian Teutonic world, on the contrary, has comprehended Thought as Spirit; Idea and Spirit are thus the distinguishing features. More particularly the facts are as follows. Because God, the still undetermined and immediate Universal, Being, or objective Thought, jealously allowing nothing to exist beside Him, is the substantial groundwork of all Philosophy, which never alters, but ever sinks more deeply within itself, and through the

development of determinations manifests itself and brings to consciousness, we may designate the particular character of the development in the first period of Philosophy by saying that this development is a simple process of determinations, figurations, abstract qualities, issuing from the one ground that potentially already contains the whole.

The second stage in this universal principle is the gathering up of the determinations manifested thus, into ideal, concrete unity, in the mode of subjectivity. The first determinations as immediate, were still abstractions, but now the Absolute, as the endlessly self-determining Universal, must furthermore be comprehended as active Thought, and not as the Universal in this determinate character. Hence it is manifested as the totality of determinations and as concrete individuality. Thus, with the *νοῦς* of Anaxagoras, and still more with Socrates, there commences a subjective totality in which Thought grasps itself, and thinking activity is the fundamental principle.

The third stage, then, is that this totality, which is at first abstract, in that it becomes realized through the active, determining, distinguishing thought, sets itself forth even in the separated determinations, which, as ideal, belong to it. Since these determinations are contained unseparated in the unity, and thus each in it is also the other, these opposed moments are raised into totalities. The quite general forms of opposition are the universal and the particular, or, in another form, Thought as such, external reality, feeling or perception. The Notion is the identity of universal and particular; because each of these is thus set forth as concrete in itself, the universal is in itself at once the unity of universality and particularity, and the same holds good of particularity. Unity is thus posited in both forms, and the abstract moments can be made complete through this unity alone; thus it has come to pass that the differences themselves are each raised up to a system of totality, which respectively confront one another as the Philosophy of Stoicism and of

Epicureanism. The whole concrete universal is now Mind; and the whole concrete individual, Nature. In Stoicism pure Thought develops into a totality; if we make the other side from Mind — natural being or feeling — into a totality, Epicureanism is the result. Each determination is formed into a totality of thought, and, in accordance with the simple mode which characterizes this sphere, these principles seem to be for themselves and independent, like two antagonistic systems of Philosophy. Implicitly both are identical, but they themselves take up their position as conflicting, and the Idea is also, as it is apprehended, in a one-sided determinateness.

The higher stage is the union of these differences. This may occur in annihilation, in scepticism; but the higher point of view is the affirmative, the Idea in relation to the Notion. If the Notion is, then, the universal — that which determines itself further within itself, but yet remains there in its unity and in the ideality and transparency of its determinations which do not become independent — the further step is, on the other hand, the reality of the Notion in which the differences are themselves brought to totalities. Thus the fourth stage is the union of the Idea, in which all these differences, as totalities, are yet at the same time blended into one concrete unity of Notion. This comprehension first takes place without constraint, since the ideal is itself only apprehended in the element of universality.

The Greek world got as far as this Idea, since they formed an ideal intellectual world; and this was done by the Alexandrian Philosophy, in which the Greek Philosophy perfected itself and reached its end. If we wish to represent this process figuratively, *A*. Thought, is (*α*) speaking generally abstract, as in universal or absolute space, by which empty space is often understood; (*β*) then the most simple space determinations appear, in which we commence with the point in order that we may arrive at the line and angle; (*γ*) what comes third is their union into the triangle, that which is indeed concrete, but which is still retained in this abstract element of

surface, and thus is only the first and still formal totality and limitation which corresponds to the *νοῦς*. *B.* The next point is, that since we allow each of the enclosing lines of the triangle to be again surface, each forms itself into the totality of the triangle and into the whole figure to which it belongs; that is the realization of the whole in the sides as we see it in Scepticism or Stoicism. *C.* The last stage of all is, that these surfaces or sides of the triangle join themselves into a body or a totality; the body is for the first time the perfect spacial determination, and that is a reduplication of the triangle. But in as far as the triangle which forms the basis is outside of the pyramid, this simile does not hold good.

Grecian Philosophy in the Neo-platonists finds its end in a perfect kingdom of Thought and of bliss, and in a potentially existent world of the ideal, which is yet unreal because the whole only exists in the element of universality. This world still lacks individuality as such, which is an essential moment in the Notion; actuality demands that in the identity of both sides of the Idea, the independent totality shall be also posited as negative. Through this self-existent negation, which is absolute subjectivity, the Idea is first raised into Mind. Mind is the subjectivity of self-knowledge; but it is only Mind inasmuch as it knows what is object to itself, and that is itself, as a totality, and is for itself a totality. That is to say, the two triangles which are above and below in the prism must not be two in the sense of being doubled, but they must be one intermingled unity. Or, in the case of body, the difference arises between the centre and the peripheral parts. This opposition of real corporeality and centre as the simple existence, now makes its appearance, and the totality is the union of the centre and the substantial — not, however, the simple union, but a union such that the subjective knows itself as subjective in relation to the objective and substantial. Hence the Idea is this totality, and the Idea which knows itself is essentially different from the substantial; the former

manifests itself independently, but in such a manner that as such it is considered to be for itself substantial. The subjective Idea is at first only formal, but it is the real possibility of the substantial and of the potentially universal; its end is to realize itself and to identify itself with substance. Through this subjectivity and negative unity, and through this absolute negativity, the ideal becomes no longer our object merely, but object to itself, and this principle has taken effect in the world of Christianity. Thus in the modern point of view the subject is for itself free, man is free as man, and from this comes the idea that because he is Mind he has from his very nature the eternal quality of being substantial. God becomes known as Mind which appears to itself as double, yet removes the difference that it may in it be for and at home with itself. The business of the world, taking it as a whole, is to become reconciled with Mind, recognizing itself therein, and this business is assigned to the Teutonic world.

The first beginning of this undertaking is found in the Religion which is the contemplation of and faith in this principle as in an actual existence before a knowledge of the principle has been arrived at. In the Christian Religion this principle is found more as feeling and idea; in it man as man is destined to everlasting bliss, and is an object of divine grace, pity and interest, which is as much as saying that man has an absolute and infinite value. We find it further in that dogma revealed through Christ to men, of the unity of the divine and human nature, according to which the subjective and the objective Idea — man and God — are one. This, in another form, is found in the old story of the Fall, in which the serpent did not delude man, for God said, "Behold, Adam has become as one of us, to know good and evil." We have to deal with this unity of subjective principle and of substance; it constitutes the process of Mind that this individual one or independent existence of subject should put aside its immediate character and bring itself forth as identical with the substantial. Such an aim is

pronounced to be the highest end attainable by man. We see from this that religious ideas and speculation are not so far asunder as was at first believed, and I maintain these ideas in order that we may not be ashamed of them, seeing that we still belong to them, and so that if we do get beyond them, we may not be ashamed of our progenitors of the early Christian times, who held these ideas in such high esteem.

The first principle of that Philosophy which has taken its place in Christendom is thus found in the existence of two totalities. This is a reduplication of substance which now, however, is characterized by the fact that the two totalities are no longer external to one another, but are clearly both required through their relation to one another. If formerly Stoicism and Epicureanism, whose negativity was Scepticism, came forth as independent, and if finally the implicitly existent universality of both was established, these moments are now known as separate totalities, and yet in their opposition they have to be thought of as one. We have here the true speculative Idea, the Notion in its determinations, each of which is brought into a totality and clearly relates to the other. We thus have really two Ideas, the subjective Idea as knowledge, and then the substantial and concrete Idea; and the development and perfection of this principle and its coming to the consciousness of Thought, is the subject treated by modern Philosophy. Thus the determinations are in it more concrete than with the ancients. This opposition in which the two sides culminate, grasped in its widest significance, is the opposition between Thought and Being, individuality and substance, so that in the subject himself his freedom stands once more within the bounds of necessity; it is the opposition between subject and object, and between Nature and Mind, in so far as this last as finite stands in opposition to Nature.

The Greek Philosophy is free from restraint because it does not yet have regard to the opposition between Being and Thought, but proceeds from the

unconscious presupposition that Thought is also Being. Certainly certain stages in the Greek Philosophy are laid hold of which seem to stand on the same platform as the Christian philosophies. Thus when we see, for instance, in the Philosophy of the Sophists, the new Academics, and the Sceptics, that they maintain the doctrine that the truth is not capable of being known, they might appear to accord with the later subjective philosophies in asserting that all thought-determinations were only subjective in character, and that hence from these no conclusions could be arrived at as regards what is objective. But there is really a difference. In the case of ancient philosophies, which said that we know only the phenomenal, everything is confined to that; it is as regards practical life that the new Academy and the Sceptics also admitted the possibility of conducting oneself rightly, morally and rationally, when one adopts the phenomenal as one's rule and guide in life. But though it is the phenomenal that lies at the foundation of things, it is not asserted that there is likewise a knowledge of the true and existent, as in the case of the merely subjective idealists of a more modern day. These last still keep in the background a potentiality, a beyond which cannot be known through thought or through conception. This other knowledge is an immediate knowledge — a faith in, a view of, and a yearning after, the beyond such as was evinced by Jacobi. The ancients have no such yearning; on the contrary, they have perfect satisfaction and rest in the certitude that only that which appears is for Knowledge. Thus it is necessary in this respect to keep strictly to the point of view from which we start, else through the similarity of the results, we come to see in that old Philosophy all the determinate character of modern subjectivity. Since in the simplicity of ancient philosophy the phenomenal was itself the only sphere, doubts as to objective thought were not present to it.

The opposition defined, the two sides of which are in modern times really related to one another as totalities, also has the form of an opposition between reason and faith, between individual perception and the objective truth which must be taken without reason of one's own, and even with a complete disregard for such reason. This is faith as understood by the church, or faith in the modern sense, i.e. a rejection of reason in favour of an inward revelation, called a direct certainty or perception, or an implicit and intuitive feeling. The opposition between this knowledge, which has first of all to develop itself, and that knowledge which has already developed itself inwardly, arouses a peculiar interest. In both cases the unity of thought or subjectivity and of Truth or objectivity is manifested, only in the first form it is said that the natural man knows the Truth since he intuitively believes it, while in the second form the unity of knowledge and Truth is shown, but in such a way that the subject raises itself above the immediate form of sensuous consciousness and reaches the Truth first of all through Thought.

The final end is to think the Absolute as Mind, as the Universal, that which, when the infinite bounty of the Notion in its reality freely emits its determinations from itself, wholly impresses itself upon and imparts itself to them, so that they may be indifferently outside of or in conflict with one another, but so that these totalities are one only, not alone implicitly, (which would simply be our reflection) but explicitly identical, the determinations of their difference being thus explicitly merely ideal. Hence if the starting-point of the history of Philosophy can be expressed by saying that God is comprehended as the immediate and not yet developed universality, and that its end — the grasping of the Absolute as Mind through the two and a half thousand years' work of the thus far inert world-spirit — is the end of our time, it makes it easy for us from one determination to go on through

the manifestation of its needs, to others. Yet in the course of history this is difficult.

We thus have altogether two philosophies — the Greek and the Teutonic. As regards the latter we must distinguish the time when Philosophy made its formal appearance as Philosophy and the period of formation and of preparation for modern times. We may first begin Teutonic philosophy where it appears in proper form as Philosophy. Between the first period and those more recent, comes, as an intermediate period, that fermentation of a new Philosophy which on the one side keeps within the substantial and real existence and does not arrive at form, while on the other side, it perfects Thought, as the bare form of a presupposed truth, until it again knows itself as the free ground and source of Truth. Hence the history of Philosophy falls into three periods — that of the Greek Philosophy, the Philosophy of the Middle Ages and the modern Philosophy. Of these the first is speaking generally, regulated by Thought, the second falls into the opposition between existence and formal reflection, but the third has the Notion as its ground. This must not be taken to mean that the first contains Thought alone; it also has conceptions and ideas, just as the latter begins from abstract thoughts which yet constitute a duality.

First Period. — This commences at the time of Thales, about 600 B.C., and goes on to the coming to maturity of the Neo-platonic philosophy with Plotinus in the third century; from thence to its further progress and development with Proclus in the fifth century until the time when all philosophy was extinguished. The Neo-platonic philosophy then made its entrance into Christianity later on, and many philosophies within Christianity have this philosophy as their only groundwork. This is a space of time extending to about 1000 years, the end of which coincides with the migration of the nations and the decline of the Roman Empire.

Second Period. — The second period is that of the Middle Ages. The Scholastics are included in it, and Arabians and Jews are also historically to be noticed, but this philosophy mainly falls within the Christian Church. This period is of something over 1000 years' duration.

Third Period. — The Philosophy of modern times made its first independent appearance after the Thirty Years' War, with Bacon, Jacob Böhm and Descartes; it begins with the distinction contained in: *cogito ergo sum*. This period is one of a couple of centuries and the philosophy is consequently still somewhat modern.

2. Sources of the History of Philosophy.

We have to seek for sources of another kind in this than in political history. There historians are the fountainheads, which again have as sources the deeds and sayings of individuals; and the historians who are not original have over and above performed their work at secondhand. But historians always have the deeds already present in history, that is to say, here brought into the form of ordinary conception; for the name of history has two meanings: it signifies on the one hand the deeds and events themselves, and on the other, it denotes them in so far as they are formed through conception for conception. In the history of Philosophy there are, on the contrary, not any sources which can be derived from historians, but the deeds themselves lie before us, and these — the philosophic operations themselves — are the true sources. If we wish to study the history of Philosophy in earnest, we must go to such springs as these. Yet these operations form too wide a field to permit of our keeping to it alone in this history. In the case of many philosophers it is absolutely necessary to confine oneself to the original authors, but in many periods, in which we cannot obtain original sources, seeing that they have not been preserved to us, (as, for instance, in that of the older Greek philosophy) we must certainly confine our attention simply

to historians and other writers. There are other periods, too, where it is desirable that others should have read the works of the philosophers and that we should receive abstracts therefrom. Several schoolmen have left behind them works of sixteen, twenty-four and twenty-six folios, and hence we must in their case confine ourselves to the researches of others. Many philosophic works are also rare and hence difficult to obtain. Many philosophers are for the most part important from an historic or literary point of view only, and hence we may limit ourselves to the compilations in which they are dealt with. The most noteworthy works on the history of Philosophy are, however, the following, regarding which I refer for particulars to the summary of Tennemann's History of Philosophy, by A. Wendt, since I do not wish to give any complete list.

1. One of the first Histories of Philosophy, which is only interesting as an attempt, is the "History of Philosophy," by Thomas Stanley (London, 1655, folio ed. III., 1701, 4. translated into Latin by Godofr. Olearius, Lipsiæ, 1711, 4). This history is no longer much used, and only contains the old philosophic schools in the form of sects and as if no new ones had existed. That is to say, it keeps to the old belief commonly held at that time, that there only were ancient philosophies and that the period of philosophy came to an end with Christianity, as if Philosophy were something belonging to heathendom and the truth only could be found in Christianity. In it a distinction was drawn between Truth as it is created from the natural reason in the ancient philosophies, and the revealed truth of the Christian religion, in which there was consequently no longer any Philosophy. In the time of the Revival of Learning there certainly were no proper philosophies, and above all in Stanley's time systems of Philosophy proper were too young for the older generations to have the amount of respect for them necessary to allow of their being esteemed as realities.

2. *Jo. Jac. Bruckeri Historia critica philosophiæ, Lipsiæ*, 1742-1744, four parts, or five volumes in four, for the fourth part has two volumes. The second edition, unaltered, but with the addition of a supplement, 1766-1767, four parts in six quartos, the last of which forms the supplement. This is an immense compilation which is not formed straight from the original sources, but is mixed with reflections after the manner of the times. As we have seen from an example above (p. 43) the accounts given are in the highest degree inaccurate. Brucker's manner of procedure is entirely unhistoric, and yet nowhere ought we to proceed in a more historic manner than in the history of Philosophy. This work is thus simply so much useless ballast. An epitome of the same is *Jo. Jac. Bruckeri Institutiones historiæ philosophicæ, usui academicæ juventutis adornatæ, Lipsiæ*, 1747, 8; second edition, Leipzig, 1756; third edition prepared by Born, Leipzig, 1790, 8.

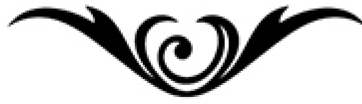
3. Dietrich Tiedmann's *Geist der Speculativen Philosophie*, Marburg, 1791-1797, 6 vols., 8. He treats of political history diffusely, but without any life, and the language is stiff and affected. The whole work is a melancholy example of how a learned professor can occupy his whole life with the study of speculative philosophy, and yet have no idea at all of speculation. His *argumenta* to the Plato of Brucker are of the same description. In every history he makes abstracts from the philosophers so long as they keep to mere ratiocination, but when the speculative is arrived at, he becomes irate, declaring it all to be composed of empty subtleties, and stops short with the words "we know better." His merit is that he has supplied valuable abstracts from rare books belonging to the Middle Ages and from cabalistic and mystical works of that time.

4. Joh. Gottlieb Buhle: *Lehrbuch der Geschichte der Philosophie und einer kritischen Literatur derselben*, Göttingen, 1796 to 1804, eight parts, 8. Ancient philosophy is treated with disproportionate brevity; the further Buhle went on, the more particular he became. He has many good

summaries of rare works, as for instance those of Giordano Bruno, which were in the Göttingen Library.

5. Wilh. Gottl. Tennemann's *Geschichte der Philosophie*, Leipzig, 1798 — 1819, eleven parts, 8. The eighth part, the Scholastic Philosophy, occupies two volumes. The philosophies are fully described, and the more modern times are better done than the ancient. The philosophies of recent times are easier to describe, since it is only necessary to make an abstract or to interpret straight on, for the thoughts contained in them lie nearer to ours. It is otherwise with the ancient philosophers, because they stand in another stage of the Notion, and on this account they are likewise more difficult to grasp. That is to say, what is old is easily overthrown by something else more familiar to us, and where Tennemann comes across such he is almost useless. In Aristotle, for instance, the misinterpretation is so great, that Tennemann foists upon him what is directly opposite to his beliefs, and thus from the adoption of the opposite to what Tennemann asserts to be Aristotle's opinion, a correct idea of Aristotelian philosophy is arrived at. Tennemann is then candid enough to place the reference to Aristotle underneath the text, so that the original and the interpretation often contradict one another. Tennemann thinks that it is really the case that the historian should have no philosophy, and he glories in that; yet he really has a system and he is a critical philosopher. He praises philosophers, their work and their genius, and yet the end of the lay is that all of them will be pronounced to be wanting in that they have one defect, which is not to be Kantian philosophers and not yet to have sought the source of knowledge. From this the result is that the Truth could not be known.

Of compendiums, three have to be noticed. 1. Frederick Aft's *Grundriss einer Geschichte der Philosophie*. (Landshut, 1807, 8; second edition, 1825) is written from a better point of view; the Philosophy is that of Schelling for the most part, but it is somewhat confused. Aft by some



formal method has distinguished ideal philosophy from real. 2. Professor Wendt's Göttingen edition of Tennemann (fifth edition, Leipzig, 1828, 8). It is astonishing to see what is represented as being Philosophy, without any consideration as to whether it has any meaning or not. Such so-called new philosophies grow like mushrooms out of the ground. There is nothing easier than to comprehend in harmony with a principle; but it must not be thought that hence something new and profound has been accomplished. 3. Rirner's *Handbuch der Geschichte der Philosophie*, 3 vols., Sulzbach, 1822-1823, 8 (second amended edition, 1829) is most to be commended, and yet I will not assert that it answers all the requirements of a History of Philosophy. There are many points which leave much to desire, but the appendices to each volume in which the principal original authorities are quoted, are particularly excellent for their purpose. Selected extracts, more specially from the ancient philosophers, are needed, and these would not be lengthy, since there are not very many passages to be given from the philosophers before Plato.

3. Method of Treatment adopted in this History of Philosophy.

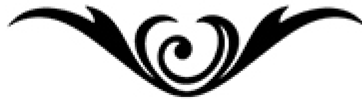
As regards external history I shall only touch upon that which is the concern of universal history, the spirit or the principle of the times, and hence I will treat of conditions of life in reference to the outstanding philosophers. Of philosophies, however, only those are to be made mention of the principles of which have caused some sensation, and through which science has made an advance; hence I shall put aside many names which would be taken up in a learned treatise, but which are of little value in respect to Philosophy. The history of the dissemination of a doctrine, its fate, those who have merely taught a particular doctrine, I pass over, as the deduction of the whole world from one particular principle.

The demand that in Philosophy an historian should have no system, should put into the philosophy nothing of his own, nor assail it with his ideas, seems a plausible one. The history of Philosophy should show just this impartiality, and it seems in so far that to give only summaries of the philosophers proves a success. He who understands nothing of the matter, and has no system, but merely historic knowledge, will certainly be impartial. But political history has to be carefully distinguished from the history of Philosophy. That is to say, though in the former, one is not indeed at liberty to limit oneself to representing the events chronologically only, one can yet keep to what is entirely objective, as is done in the Homeric epic. Thus Herodotus and Thucydides, as free men, let the objective world do freely and independently as it would; they have added nothing of their own, neither have they taken and judged before their tribunal the actions which they represented. Yet even in political history there is also a particular end kept in view. In Livy the main points are the Roman rule, its enlargement, and the perfecting of the constitution; we see Rome arise, defend itself, and exercise its mastery. It is thus that the self-developing reason in the history of Philosophy makes of itself an end, and this end is not foreign or imported, but is the matter itself, which lies at the basis as universal, and with which the individual forms of themselves correspond. Thus when the history of Philosophy has to tell of deeds in history, we first ask, what a deed in Philosophy is; and whether any particular thing is philosophic or not. In external history everything is in action — certainly there is in it what is important and that which is unimportant — but action is the idea immediately placed before us. This is not the case in Philosophy, and on this account the history of Philosophy cannot be treated throughout without the introduction of the historian's views.

ORIENTAL PHILOSOPHY

THE FIRST PHILOSOPHY in order is the so-called Oriental, which, however, does not enter into the substance or range of our subject as represented here. Its position is preliminary, and we only deal with it at all in order to account for not treating of it at greater length, and to show in what relation it stands to Thought and to true Philosophy. The expression Eastern philosophy is specially employed in reference to the period in which this great universal Oriental conception aroused the East — the land of circumscription and of limitation, where the spirit of subjectivity reigns. More particularly in the first centuries of Christendom — that significant period — did these great Oriental ideas penetrate into Italy; and in the Gnostic philosophy they began to force the idea of the illimitable into the Western mind, until in the Church the latter again succeeded in obtaining the ascendency and hence in firmly establishing the Divine. That which we call Eastern Philosophy is more properly the religious mode of thought and the conception of the world belonging generally to the Orientals and approximates very closely to Philosophy; and to consider the Oriental idea of religion just as if it were religious philosophy, is to give the main reason why it is so like.

We do not similarly maintain that the Roman, Greek and Christian Religions constitute Philosophy. These bear all the less similarity thereto in that the Greek and Roman gods as also Christ and the God of the Jews, on account of the principle of individual freedom which penetrates the Greek and still more the Christian element, make their appearance immediately as the explicit, personal forms, which, being mythological or Christian, must first be themselves interpreted and changed into a philosophic form. In the



case of Eastern Religion, on the contrary, we are much more directly reminded of the philosophic conception, for since in the East the element of subjectivity has not come forth, religious ideas are not individualized, and we have predominating a kind of universal ideas, which hence present the appearance of being philosophic ideas and thoughts. The Orientals certainly have also individual forms, such as Brahma, Vishnu and Civa, but because freedom is wanting the individuality is not real, but merely superficial. And so much is this the case, that when we suppose that we have to deal with a human form, the same loses itself again and expands into the illimitable. Just as we hear amongst the Greeks of a Uranus and Chronos — of Time individualized — we find with the Persians, Zeroane Akerene, but it is Time unlimited. We find Ormuzd and Ahriman to be altogether general forms and ideas; they appear to be universal principles which thus seem to bear a relationship to Philosophy or even seem to be themselves philosophic.

Just as the content of the Eastern religions, God, the essentially existent, the eternal, is comprehended somewhat in the light of universal, we find the relative positions of individuals to Him to be the same. In the Eastern religions the first condition is that only the one substance shall, as such, be the true, and that the individual neither can have within himself, nor can he attain to any value in as far as he maintains himself as against the being in and for itself. He can have true value only through an identification with this substance in which he ceases to exist as subject and disappears into unconsciousness. In the Greek and Christian Religion, on the other hand, the subject knows himself to be free and must be maintained as such; and because the individual in this way makes himself independent, it is undoubtedly much more difficult for Thought to free itself from this individuality and to constitute itself in independence. The higher point of view implicitly contained in the Greek individual freedom, this happier,

larger life, makes more difficult the work of Thought, which is to give due value to the universal. In the East, on the contrary, the substantial in Religion is certainly on its own view the principal matter, the essential — and with it lawlessness, the absence of individual consciousness is immediately connected — and this substance is undoubtedly a philosophic idea. The negation of the finite is also present, but in such a manner that the individual only reaches to its freedom in this unity with the substantial. In as far as in the Eastern mind, reflection, consciousness come through thought to distinction and to the determination of principles, there exist such categories and such definite ideas not in unity with the substantial. The destruction of all that is particular either is an illimitable, the exaltitude of the East, or, in so far as that which is posited and determined for itself is known, it is a dry, dead understanding, which cannot take up the speculative Notion into itself. To that which is true, this finite can exist only as immersed in substance; if kept apart from this it remains dead and arid. We thus find only dry understanding amongst the Easterns, a mere enumeration of determinations, a logic like the Wolffian of old. It is the same as in their worship, which is complete immersion in devotion and then an endless number of ceremonials and of religious actions; and this on the other side is the exaltitude of that illimitable in which everything disappears.

There are two Eastern nations with which I wish just now to deal — the Chinese and the Indian.

A. Chinese Philosophy.

IT IS TRUE of the Chinese as well as of the Indians that they have a great reputation for culture; but this, as well as the amount of Indian literature which exists, has largely diminished through a further knowledge of it. The great knowledge of these people bears upon such subjects as Religion, Science, the constitution and administration of the state, poetry, handicrafts and commerce. But when we compare the laws and constitution of China with the European, we find that we can only do so in respect of what is formal, for the content is very different. It is also felt, however consistently they may be constituted as to form, that they cannot find their place with us, that we could not allow of their giving us satisfaction, and that they take the place of law, or rather that they put an end to it. It is the same thing when we compare Indian poetry with European; considered as a mere play of the imagination it is as brilliant, rich and cultured as that of any other people. But in poetry we have to do with content, and that is the important part of it. Even the Homeric poetry is not serious for us, and hence such poetry cannot last. It is not the lack of genius in the Oriental poetry; the amount of genius is the same and the form may be very much developed, but the content remains confined within certain bounds and cannot satisfy us, nor can it be our content. This is at outset a fact applying universally to such comparisons, inasmuch as men let themselves be dazzled by form, making it equal with, or even preferring it to ours.

1. *Confucius*. The first subject of remark with regard to the Chinese respects the teaching of Confucius (500 years before Christ) which made a great sensation in Liebnitz' time; this teaching is a moral philosophy. Confucius has, besides, commented upon the old traditional principles of

the Chinese; his high moral teaching, however, gave him his great fame, and that teaching is the authority most esteemed in China. Confucius' Biography has been translated by French missionaries from the original Chinese; from this he appears to have been almost contemporaneous with Thales, to have been for a considerable time Minister, to have then fallen into disfavour, lost his place and lived and philosophized amongst his own friends, while still being often asked to give advice. We have conversations between Confucius and his followers in which there is nothing definite further than a commonplace moral put in the form of good, sound doctrine, which may be found as well expressed and better, in every place and amongst every people. Cicero gives us *De Officiis*, a book of moral teaching more comprehensive and better than all the books of Confucius. He is hence only a man who has a certain amount of practical and worldly wisdom — one with whom there is no speculative philosophy. We may conclude from his original works that for their reputation it would have been better had they never been translated. The treatise which the Jesuits produced[9] is, however, more a paraphrase than a translation.

2. *The Philosophy of the Y-king*. A second matter of remark is that the Chinese have also taken up their attention with abstract thoughts and with pure categories. The old book Y-king, or the Book of Principles, serves as the foundation for such; it contains the wisdom of the Chinese, and its origin is attributed to Fohi. That which is there by him related passes into what is quite mythological, fabulous and even senseless. The main point in it is the ascription to him of the discovery of a table with certain signs or figures (Ho-tu) which he saw on the back of a horse-dragon as it rose out of the river.[10] This table contains parallel lines above one another, which have a symbolical signification; and the Chinese say that these lines are the foundation of their characters as also of their philosophy. These symbols are quite abstract categories, and consequently the most superficial

determinations of the understanding. It must certainly be considered that pure thoughts are brought to consciousness, but in this case we make no advance, merely remaining stationary so far as they are concerned. The concrete is not conceived of speculatively, but is simply taken from ordinary ideas, inasmuch as it is expressed in accordance with their forms of representation and of perception. Hence in this collection of concrete principles there is not to be found in one single instance a sensuous conception of universal natural or spiritual powers.

To satisfy the curious, I will give these principles in greater detail. The two fundamental, figures are a horizontal line (⚊, Yang) and the one which is broken into two equal parts (⚋, Yin). The first which is the perfect, the father, the manlike, the unity, such as is represented by the Pythagoreans, represents the affirmative; the second is the imperfect, the mother, the womanly, the duality and the negation. These signs are held in high esteem, for they are considered to be the Principles of things. First of all they are placed in combination of two from which four figures result:⚌, ⚍, ⚎, ⚏, or the great Yang, the little Yang, the little Yin, and the great Yin. The signification of these four representations is matter as perfect and imperfect. The two Yangs are perfect matter: the first is in the category of youth and power; the second is the same matter, but as old and powerless. The third and fourth images, where Yin constitutes the basis, are imperfect matter, which has again the two determinations of youth and age, strength and weakness. These lines are further united in sets of three, and thus eight figures result, which are called Kua, ☰, ☱, ☲, ☳, ☴, ☵, ☶, ☷. I will give the interpretation of these Kua just to show how superficial it is. The first sign, containing the great Yang and the Yang is the Heavens (Tien) or the all-pervading ether. The Heavens to the Chinese means what is highest, and it has been a great source of division amongst the missionaries whether they ought to call the Christian God, Tien, or not. The second sign is pure

water (Tui), the third pure fire (Li), the fourth thunder (Tschin), the fifth wind (Siun), the sixth common water (Kan), the seventh mountains (Ken), the eighth the earth (Kuen). We should not place heaven, thunder, wind and mountains on the same footing. We may thus obtain a philosophic origin for everything out of these abstract thoughts of absolute unity and duality. All symbols have the advantage of indicating thoughts and of calling up significations, and in this way such are likewise present there. Thought thus forms the first beginning, but afterwards it goes into the clouds, and Philosophy does likewise. Therefore if Windischmann[11] in his commentary recognizes in this system of Confucius, a "thorough interconnection between all Kua in the whole series," it should be remembered that not a particle of the Notion is to be found in it.

United further in sets of four, the lines produce sixty-four figures, which the Chinese consider to be the origin of their characters, since there have been added to these straight lines those which are perpendicular and inclined in different directions.

In Schuking there is also a chapter on Chinese wisdom, where the five elements from which everything is made make their appearance. These are fire, water, wood, metal and earth, which exist all in confusion, and which we should no more than we did before, allow to be principles. The first canon in the law is found in the Schuking, as the naming of the five elements; the second, considerations upon the last, and so it goes on.[12] Universal abstraction with the Chinese thus goes on to what is concrete, although in accordance with an external kind of order only, and without containing anything that is sensuous. This is the principle of all Chinese wisdom and of all the objects of study in China.

3. *The Sect of the Tao-See*. There is yet another separate sect, that of the Tao-See, the followers of which are not mandarins and attached to the state

religion, nor are they Buddhists or Lamaics. The originator of this philosophy and the one who was closely connected with it in his life, is Lao-Tsö, who was born in the end of the seventh century before Christ and who was older than Confucius, for this representative of the more political school went to him in order to ask his advice. The book of the Lao-Tsö, Tao-king, is certainly not included in the proper Kings and has not their authority, but it is an important work amongst the Taosts or the followers of reason, who call their rule in life Tao-Tao, which means the observation of the dictates or the laws of reason. They dedicate their lives to the study of reason, and maintain that he who knows reason in its source will possess universal science, remedies for every ill and all virtue; he will also have obtained a supernatural power of being able to fly to heaven and of not dying.[13]

His followers say of Lao-Tsö himself that he is Buddha who as man became the ever-existent God. We still have his principal writings; they have been taken to Vienna, and I have seen them there myself. One special passage is frequently taken from them: "Without a name Tao[14] is the beginning of Heaven and Earth, and with a name she is the Mother of the Universe. It is only in her imperfect state that she is considered with affection; who desires to know her must be devoid of passions." Abel Rémusat says that taken at its best this might be expressed by the Greek in *όογος*. The celebrated passage which is often quoted by the ancients is this,[15] "Reason has brought forth the one; the one has brought forth the two; the two have brought forth the three; and the three have produced the whole world." In this men have tried to find a reference to the Trinity. "The Universe rests upon the principle of Darkness, the universe embraces the principle of Light," or "it is embraced by ether;" it can be thus reversed, because the Chinese language has no case inflection, the words merely standing in proximity. Another passage in the same place has this sense,

“He whom ye look at and do not see, is named I; thou hearkenest to him and hearest him not, and he is called Hi; thou seekest for him with thy hand and touchest him not, and his name is Weï. Thou meetest him and seest not his head; thou goest behind him and seest not his back.” These contradictory expressions are called the “chain of reason.” One naturally thinks in quoting these passages of יהרה and of the African kingly name of Juba and also of *Jovis*. This I-hi-weï or I-H-W[16] is further made to signify an absolute vacuity and that which is Nothing; to the Chinese what is highest and the origin of things is nothing, emptiness, the altogether undetermined, the abstract universal, and this is also called Tao or reason. When the Greeks say that the absolute is one, or when men in modern times say that it is the highest existence, all determinations are abolished, and by the merely abstract Being nothing has been expressed excepting this same negation, only in an affirmative form. But if Philosophy has got no further than to such expression, it still stands on its most elementary stage. What is there to be found in all this learning?

B. Indian Philosophy.

IF WE HAD formerly the satisfaction of believing in the antiquity of the Indian wisdom and of holding it in respect, we now have ascertained through being acquainted with the great astronomical works of the Indians, the inaccuracy of all figures quoted. Nothing can be more confused, nothing more imperfect than the chronology of the Indians; no people which has attained to culture in astronomy, mathematics, &c., is as incapable for history; in it they have neither stability nor coherence. It was believed that such was to be had in the time of Wikramaditya, who was supposed to have lived about 50 B.C., and under whose reign the poet Kalidasa, author of Sakontala, lived. But further research discovered half a dozen Wikramadityas and careful investigation has placed this epoch in our eleventh century. The Indians have lines of kings and an enormous quantity of names, but everything is vague.

We know how the ancient glory of this land was held in the highest estimation even by the Greeks, just as they knew about the Gymnosophists, who were excellent men, though people ventured to call them otherwise — men who having dedicated themselves to a contemplative life, lived in abstraction from external life, and hence, wandering about in hordes, like the Cynics renounced all ordinary desires. These latter in their capacity as philosophers, were also more especially known to the Greeks, inasmuch as Philosophy is also supposed to exist in this abstraction, in which all the relationships of ordinary life are set aside; and this abstraction is a feature which we wish to bring into prominence and consider.

Indian culture is developed to a high degree, and it is imposing, but its Philosophy is identical with its Religion, and the objects to which attention

is devoted in Philosophy are the same as those which we find brought forward in Religion. Hence the holy books or Vedas also form the general groundwork for Philosophy. We know the Vedas tolerably well; they contain principally prayers addressed to the many representations of God, direction as to ceremonials, offerings, &c. They are also of the most various periods; many parts are very ancient, and others have taken their origin later, as, for instance, that which treats of the service of Vishnu. The Vedas even constitute the basis for the atheistical Indian philosophies; these, too, are not wanting in gods, and they pay genuine attention to the Vedas. Indian Philosophy thus stands within Religion just as scholastic Philosophy stands within Christian dogmatism, having at its basis and presupposing the doctrines of the church. Mythology takes the form of incarnation or individualization, from which it might be thought that it would be opposed to Philosophy in its universality and ideality; incarnation is not, however, here taken in so definite a sense, for almost everything is supposed to partake of it, and the very thing that seems to define itself as individuality falls back directly within the mist of the universal. The idea of the Indians more appropriately expressed, is that there is one universal substance which may be laid hold of in the abstract or in the concrete, and out of which everything takes its origin. The summit of man's attainment is that he as consciousness should make himself identical with the substance, in Religion by means of worship, offerings, and rigid acts of expiation, and in Philosophy through the instrumentality of pure thought.

It is quite recently that we first obtained a definite knowledge of Indian Philosophy; in the main we understand by it religious ideas, but in modern times men have learned to recognize real philosophic writings. Colebrooke,[17] in particular, communicated abstracts to us from two Indian philosophic works, and this forms the first contribution we have had in reference to Indian Philosophy. What Frederick von Schlegel says about the

wisdom of the Indians is taken from their religious ideas only. He is one of the first Germans who took up his attention with Indian philosophy, yet his work bore little fruit because he himself read no more than the index to the Ramayana. According to the abstract before mentioned, the Indians possess ancient philosophic systems; one part of these they consider to be orthodox, and those which tally with the Vedas are particularly included; the others are held to be heterodox and as not corresponding with the teaching of the holy books. The one part, which really is orthodox, has no other purpose than to make the deliverances of the Vedas clearer, or to derive from the text of these original treatises an ingeniously thought-out Psychology. This system is called Mimansa, and two schools proceed from it. Distinguished from these there are other systems, amongst which the two chief are those of the Sanc'hya and Nyaya. The former again divides into two parts which are, however, different in form only. The Nyaya is the most developed; it more particularly gives the rules for reasoning, and may be compared to the Logic of Aristotle. Colebrooke has made abstracts from both of these systems, and he says that there are many ancient treatises upon them, and that the *versus memoriales* from them are very extensive.

1. *The Sanc'hya Philosophy of Capila*. The originator of the Sanc'hya is called Capila, and he was an ancient sage of whom it was said that he was a son of Brahma, and one of the seven great Holy men; others say that he was an incarnation of Vishnu, like his disciple Asuri, and that he was identified with fire. As to the age of the Aphorisms (Sutras) of Capila, Colebrooke can say nothing; he merely mentions that they were already mentioned in other very ancient books, but he does not feel able to say anything definite in the matter. The Sanc'hya is divided into different schools, of which there are two or three, which, however, differ from one another only in a few particulars. It is held to be partly heterodox and partly orthodox.

The real aim of all Indian schools and systems of Philosophy, whether atheistic or theistic, is to teach the means whereby eternal happiness can be attained before, as well as after, death. The Vedas say, “What has to be known is the Soul; it must be distinguished from nature, and hence it will never come again.” That means that it is exempt from metempsychosis and likewise from bodily form, so that it does not after death make its appearance in another body. This blessed condition therefore is, according to the Sanc’hya, a perfect and eternal release from every kind of ill. It reads: — “Through Thought, the true Science, this freedom can be accomplished; the temporal and worldly means of procuring enjoyment and keeping off spiritual or bodily evil are insufficient; even the methods advocated by the Vedas are not effectual for the purpose, and these are found in the revealed form of worship, or in the performance of religious ceremonies as directed in the Vedas.” The offering up of animals is specially valuable as such a means; and in this regard the Sanc’hya rejects the Vedas; such an offering is not pure, because it is connected with the death of animals, and the main tenet in the former is not to injure any animal. Other methods of deliverance from evil are in the excessive acts of penance performed by the Indians, to which a retreat within themselves is added. Now when the Indian thus internally collects himself, and retreats within his own thoughts, the moment of such pure concentration is called Brahma, the one and the clearly supersensuous state, which the understanding calls the highest possible existence. When this is so with me, then am I Brahma. Such a retreat into Thought takes place in the Religion as well as in the Philosophy of the Indians, and they assert with reference to this state of bliss that it is what is highest of all, and that even the gods do not attain to it. Indra, for example, the god of the visible heavens, is much lower than the soul in this life of internal contemplation; many thousand Indras have passed away, but the soul is exempt from every change. The Sanc’hya only differs from

Religion in that it has a complete system of thought or logic, and that the abstraction is not made a reduction to what is empty, but is raised up into the significance of a determinate thought. This science is stated to subsist in the correct knowledge of the principles — which may be outwardly perceptible or not — of the material and of the immaterial world.

The Sanc'hya system separates itself into three parts: the method of knowledge, the object of knowledge, and the determinate form of the knowledge of principles.

a. As regards the methods of obtaining knowledge, the Sanc'hya says that there are three kinds of evidence possible: first of all, that of perception; secondly, that of inference; thirdly, that of affirmation, which is the origin of all others, such as reverence for authority, a teachable disposition, and tradition. Perception is said to require no explanation. Inference is a conclusion arrived at from the operation of cause and effect, by which one determination merely passes over into a second. There are three forms, because inferences are made either from cause to effect, from effect to cause, or in accordance with different relations of cause and effect. Rain, we may say, is foretold when a cloud is seen to be gathering; fire, when a hill is seen to be smoking; or the movement of the moon is inferred when, at different times, it is observed to be in different places. These are simple, dry relations, originating from the understanding. Under affirmation, tradition or revelation is understood, such as that of the orthodox Vedas; in a wider sense, immediate certainty or the affirmation in my consciousness, and in a less wide sense, an assurance through verbal communication or through tradition is so denominated.

b. Of objects of knowledge or of principles, the Sanc'hya gives five-and-twenty; and these I will mention to show the want of order that is in them.

1. Nature, as the origin of everything, is said to be the universal, the material cause, eternal matter, undistinguished and undistinguishable,

without parts, productive but without production, absolute substance. 2. Intelligence, the first production of Nature and itself producing other principles, distinguishable as three gods through the efficacy of three qualities, which are Goodness, Foulness and Darkness. These form one person and three gods, namely, Brahma, Vishnu, and Maheswara. 3. Consciousness, personality, the belief that in all perceptions and meditations I am present, that the objects of sense, as well as of intelligence, concern me, in short that I am I. It issues from the power of intelligence, and itself brings forth the following principles. 4-8. Five very subtle particles, rudiments or atoms, which are only perceptible to an existence of a higher order, and not through the senses of men; these proceed from the principle of consciousness, and bring forth on their own account the five elements — space and the first origination of earth, water, fire and air. 9-19. The eleven succeeding principles are the organs of feeling, which are produced by the personality. There are ten external organs, comprising the five senses and five active organs — the organs of the voice, hands and feet, the excretory and genital organs. The eleventh organ is that of the inward sense. 20 to 24. These principles are the five elements brought forth from the earlier-named rudiments — the ether which takes possession of space, air, fire, water and earth. 25. The soul. In this very unsystematic form we see only the first beginnings of reflection, which seem to be put together as a universal. But this arrangement is, to say nothing of being unsystematic, not even intelligent.

Formerly the principles were outside of and successive to one another; their unity is found in the Soul. It is said of the latter that it is not produced, and is not productive; it is individual, and hence there are many souls; it is sentient, eternal, immaterial and unchangeable. Colebrooke here distinguishes between the theistic and atheistic systems of the Sanc’hya, since the former not only admits of individual souls, but also upholds God

(Iswara) as the ruler of the world. The knowledge of the soul still remains the principal point. It is through the consideration of nature and through abstraction from nature that the unity of the soul with nature is brought about, just as the lame man and the blind are brought together for the purposes of transport and of guidance — the one being the bearer and being directed (nature?), the other being borne and guiding (soul?). Through the union of Soul and Nature, the creation is effected, and this consists in the development of intelligence and of other principles. This unity is the actual support for that which is, and the means by which it is so maintained. It is at the same time an important consideration that the negation of the object which is contained in thought, is necessary in order to comprehend; this reflection has far more depth than the ordinary talk about immediate consciousness. The view is superficial and perverted which maintains the Easterns to have lived in unity with nature; the soul in its activity, mind, is indeed undoubtedly in relation with nature and in unity with the truth of nature. But this true unity essentially contains the moment of the negation of nature as it is in its immediacy; such an immediate unity is merely the life of animals, the life and perception of the senses. The idea which is present to the Indians is thus indeed the unity of nature and of soul, but the spiritual is only one with nature in so far as it is within itself, and at the same time manifests the natural as negative. As regards the creation, this is further signified. The soul's desire and end is for satisfaction and freedom, and with this view it is endowed with a subtle environment, in which all the above-mentioned principles are contained, but only in their elementary development. Something of our ideal, or of the implicit is present in this idea; it is like the blossom which is ideally in the bud, and yet is not actual and real. The expression for this is Lingam, the generative power of nature, which holds a high place in the estimation of all Indians. This subtle form, says the Sanc'hya, also assumes a coarse bodily shape, and clothes itself in

several garbs; and as a means of preventing the descent into a coarse materiality, philosophic contemplation is recommended.

Hitherto we have observed the abstract principles; the following is to be noticed regarding the creation of the concrete actuality of the universe. The bodily creation consists of the soul habited in a material body; it comprehends eight orders of higher beings and five orders of lower beings, which constitute — with men, who form a single class — fourteen orders, and these are divided into three worlds or classes. The first eight orders have appellations which appear in Indian mythology, viz. Brahma, Prajapatis, Indra, &c.; there are both gods and demi-gods, and Brahma himself is represented here as if he were created. The five lower orders are composed of animals: the four-footed animals are in two classes, birds come third, reptiles, fishes, and insects fourth, and, finally, vegetable and inorganic nature comes fifth. The abode of the eight higher classes is in heaven; they are, it is said, in the enjoyment of that which is good and virtuous, and consequently are happy, though still they are but imperfect and transient; underneath is the seat of darkness or delusion, where beings of the lower orders live; and between is the world of men, where untruth or passion reigns.

Against these three worlds, which have their place in the material creation, the system places yet another creation, and that is the Intellectual, consisting of the powers of understanding and the senses. These last are again divided into four classes, viz. those determinations which impede, those which incapacitate, those which satisfy, and those which perfect the intelligence. 1. Sixty-two of the impeding determinations are adduced; eight kinds of error, as many of opinion or of illusion, ten of passion as being illusion carried to extremity, eighteen of hate or sullenness, and the same of grief. Here there is shown somewhat of an empirical, psychological, and observing mode of treatment. 2. The incapacity of intelligence has again

eight-and-twenty variations: injury, want of organs, &c. 3. Satisfaction is either inward or outward. The inward satisfaction is fourfold; the first concerns nature, the whole universal or substantial, and is set forth in the opinion that philosophic knowledge is a modification of the principle of nature itself, with which there is immediately united the anticipation of a liberty given through the act of nature; yet the true liberty is not to be expected as an act of nature, for it is the soul which has to bring forth that liberty through itself and through its thinking activity. The second satisfaction is in the belief of securing liberty through ascetic exercises, pains, torments, and penances. The third has to do with time — the idea that liberty will come in the course of time and without study. The fourth satisfaction is obtained in a belief in luck — in believing that liberty depends on fate. The external mode of obtaining satisfaction relates to continence from enjoyment, but continence from sensuous motives, such as dislike to the unrest of acquisition, and fear of the evil consequences of enjoyment. 4. There are, again, several means of perfecting the intelligence adduced, and, amongst others, there is the direct psychological mode of perfecting mind, as is seen in the act of reasoning, in friendly converse, and so on. This we may find, indeed, in our applied logic.

There is still somewhat to be remarked as to the main points of the system. The Sanc'hya, and likewise the other Indian systems of Philosophy, occupy themselves particularly with the three *qualities* (Guna) of the absolute Idea, which are represented as substances and as modifications of nature. It is noteworthy that in the observing consciousness of the Indians it struck them that what is true and in and for itself contains three determinations, and the Notion of the Idea is perfected in three moments. This sublime consciousness of the trinity, which we find again in Plato and others, then went astray in the region of thinking contemplation, and retains its place only in Religion, and there but as a Beyond. Then the

understanding penetrated through it, declaring it to be senseless; and it was Kant who broke open the road once more to its comprehension. The reality and totality of the Notion of everything, considered in its substance, is absorbed by the triad of determinations; and it has become the business of our times to bring this to consciousness. With the Indians, this consciousness proceeded from sensuous observation merely, and they now further define these qualities as follows: The first and highest is with them the Good (Sattva); it is exalted and illuminating — allied to joy and felicity — and piety predominates within it. It prevails in fire, and therefore flames rise up and sparks fly upwards; if it has ascendency in men, as it does have in the eight higher orders, it is the origin of virtue. This also is the universal — throughout and in every aspect the affirmative — in abstract form. The second and mediate quality is deceit or passion (Najas, Tejas) which for itself is blind; it is that which is impure, harmful, hateful; it is active, vehement, and restless, allied to evil and misfortune, being prevalent in the air, on which account the wind moves transversely; amongst living beings it is the cause of vice. The third and last quality is darkness (Tamas); it is inert and obstructive, allied to care, dullness, and disappointment, predominating in earth and water, and hence these fall down and tend ever downwards. With living beings stupidity takes its origin in this. The first quality is thus the unity with itself; the second the manifestation or the principle of difference, desire, disunion, as wickedness; the third, however, is mere negation, as in mythology it is concretely represented in the form of Siva, Mahadeva, or Maheswara, the god of change or destruction. As far as we are concerned, the important distinction is that the third principle is not the return to the first which Mind and Idea demand, and which is effected by the removal of the negation in order to effect a reconciliation with itself and to go back within itself. With the Indians the third is still change and negation.

These three qualities are represented as the essential being of nature. The Sanc'hya says, "We speak of them as we do of the trees in a wood." Yet this is a bad simile, for the wood is but an abstract universal, in which the individuals are independent. In the religious ideas of the Vedas, where these qualities also appear as Trimurti, they are spoken of as if they were successive modifications, so that "Everything was darkness first, then received the command to transform itself, and in this manner the form" — which, however, is a worse one— "of movement and activity (foulness) was assumed, until finally, by yet another command from Brahma, the form of goodness was adopted."

Further determinations of the intelligence in respect of these qualities follow. It is said that eight kinds of intelligence are counted, of which four pertain to what is good: — virtue first, science and knowledge second, thirdly, freedom from passion, which, may have either an external and sensuous motive — the repugnance to disturbance — or be of an intellectual nature, and emanate from the conviction that nature is a dream, a mere jugglery and sham; the fourth is power. This last is eight-fold, and hence eight special qualities are given as being present; viz. the power to contract oneself into a quite small form, for which everything shall be penetrable; the power to expand into a gigantic body; the power to become light enough to be able to mount to the sun on a sunbeam; the possession of unlimited power of action in the organs, so that with the finger-tips the moon may be touched; irresistible will, so that, for instance, one may dive into the earth as easily as in the water; mastery over all living and lifeless existence; the power to change the course of nature; and the power to perform everything that is wished. "The feeling that such transcendent power," Colebrooke goes on, "is within the reach of man in his life is not peculiar to the Sanc'hya sect, but is common to all systems and religious ideas, and such a power is in good faith ascribed to many holy men and

Brahmins in dramas and popular narratives.” Sensuous evidence is of no account as opposed to this, for with the Indian, perception of the senses is, generally speaking, absent: everything adopts the form of imaginary images, every dream is esteemed just as much as truth and actuality. The Sanc’hya ascribes this power to man, in so far as he elevates himself through the working of his thought into inward subjectivity. Colebrooke says, “The Yoga-sastra names in one of its four chapters a number of acts by which such power may be attained; these are exemplified by a profound meditation, accompanied by holding back the breath and inactivity of the senses, while a fixed position is constantly preserved. By means of such acts the adept reaches the knowledge of all that is past as well as future; he has learned to divine the thoughts of others, to have the strength of elephants, the courage of lions, the swiftness of the wind, the power to fly in the air, to swim in the water, to dive into the earth, to behold every possible world in one moment, and to accomplish other wonderful deeds. But the quickest mode of reaching happiness through deep contemplation is that worship of God which consists in ever murmuring the mystic name of God, ‘Om.’” This idea is a very general one.

Colebrooke deals more particularly with the theistic and atheistic divisions of the Sanc’hya as distinguished. While in the theistic system, Iswara, the chief ruler of the world, is a soul or spirit distinguished from the other souls, Capila, in the atheistic Sanc’hya, disowns Iswara, the originator of the world by volition, alleging that there is no proof of the existence of God, since it is not shown by perception, nor is it possible that it should be deduced from argument. He recognizes, indeed, an existence proceeding from nature which is Absolute Intelligence, the source of all individual intelligences and the origin of all other existences, which gradually develop out of it: about the Creator of the world, understanding this to be creation, he emphatically remarks that “the truth of such an Iswara is proved.” But,

he says, “the existence of effects depends on the soul, on consciousness, and not on Iswara. Everything proceeds from the great Principle, which is Intelligence;” to this the individual soul belongs, and through this it is brought about.

c. As to the third division of the Sanc’hya, the more particular consideration of the forms of knowledge as regards the principle, I shall make a few more remarks, which may perhaps have some interest. Of the various kinds of knowledge already given, that of reasoning, of the connection existing with the conclusion through the relation of cause and effect, remains the chief, and I will show how the Indians comprehend this relation. The understanding and all other principles derived from it are to them effects, and from these they reason to their causes; in one respect this is analogous to our inference, but in another different. They perceive that “effects exist even before the operation of the causes; for what does not exist cannot be made explicit in existence through causality.” Colebrooke says, “This means that effects are educts rather than products.” But the question is just what products are. As an example of how the effect is already contained in the cause, the following is given: — Oil is already existent in the seeds of sesamum before it is pressed out; rice is in the husk before it is thrashed; milk is in the udder of the cow before it is milked. Cause and effect are in reality the same; a piece of a dress is not really different from the yarn from which it is woven, for the material is the same. This is how this relation is understood. A consequence derived from it was the eternity of the world, for the saying “Out of nothing there comes nothing,” which Colebrooke also mentions, is opposed to the belief in a creation of the world from nothing in our religious sense. As a matter of fact, it must also be said, “God creates the world not out of nothing, but out of Himself; it is His own determination, by Him brought into existence.” The distinction between cause and effect is only a formal distinction; it is

the understanding that keeps them separate, and not reason. Moisture is the same as rain; or again we speak in mechanics of different movements, whereas motion has the same velocity before as after impact. The ordinary consciousness cannot comprehend the fact that there is no real distinction between cause and effect.

The Indians infer the existence of "a universal cause which is undistinguishable, while determinate things are finite," and on this account there must be a cause permeating through them. Even intelligence is an effect of this cause, which is the soul in so far as it is creative in this identity with nature after its abstraction from it. Effect proceeds from cause, yet, on the other hand, this last is not independent, but goes back into universal cause. General destruction is postulated along with what is called the creation of the three worlds. Just as the tortoise stretches out its limbs and then draws them back again within its shell, the five elements, earth, &c., which constitute the three worlds, are in the general ruin and dissolution of things which takes place within a certain time, again drawn back in the reverse order to that in which they emerged from the original principle, because they return, step by step, to their first cause — that is, to what is highest and inseparable, which is Nature. To this the three qualities, goodness, passion, and darkness, are attributed; the further attributes of these determinations may be very interesting, but they are understood in a very superficial way. For it is said that nature operates through the admixture of these three qualities; each thing has all three within itself, like three streams which flow together; it also works by means of modifications, just as water which is soaked in through the roots of plants and led up into the fruit, obtains a special flavour. There are hence only the categories of admixture and of modification present. The Indians say:— "Nature has these three qualities in her own right as her forms and characteristics; other

things have them only because they are present in them as effects of the former."

We still have to consider the relation of nature to spirit. "Nature, although it is quite inanimate, performs the office of preparing the soul for its freedom, just as it is the function of milk — of a substance having no sensation — to nourish the calf." The Sanc'hya makes the following simile. Nature is like a *bajadere* showing herself to the soul as to an audience; she is abused for her impudence in exposing herself too often to the rude gaze of the spectators. "But she retires when she has shown herself sufficiently; she does so because she has been seen, and the audience retires because it has seen. Nature has no further use as regards the soul, and yet the union remains a lasting one." With the attainment of intellectual knowledge through the study of principles, the final, incontrovertible, single truth is learnt, that "I neither am, nor is anything mine, nor do I exist." That is, the personality is still distinguished from the soul, and finally personality and self-consciousness disappear for the Indian. "Everything that comes forth in consciousness is reflected by the soul, but like an image which does not dull the crystal of the soul, and does not belong to it. In possession of this self-knowledge" (without personality) "the soul contemplates nature at its ease, thus exempt from all terrible variation, and freed from every other form and operation of the understanding, with the exception of this spiritual knowledge." This is a mediate spiritual knowledge of the likewise spiritualized content — a knowledge without personality and consciousness. "The soul still indeed remains for some time in bodily garb, but this is only so after the same manner as the potter's wheel, when the jar is perfected, still turns round from the effect of the previously given impulse." The soul thus has, according to the Indians, nothing further to do with the body, and its connection therewith is therefore a superfluous one. "But when the separation of the already prepared soul from its body at

length comes to pass, and nature is done with soul, the absolute and final liberation is accomplished.” Here we find the crowning moments in the Sanc’hya philosophy.

2. *The Philosophy of Gotama and Canade*. The philosophy of Gotama and that of Canade belong to one another.[18] The philosophy of Gotama is called Nyaya (reasoning), and that of Canade, Vaiseshica (particular). The first is a specially perfect dialectic, and the second, on the other hand, occupies itself with physics, that is, with particular or sensuous objects. Colebrooke says:— “No department of science or of literature has taken up the attention of the Indians more than the Nyaya; and the fruit of this study is an infinite number of writings, included in which there may be found the works of very celebrated men of learning. The system which Gotama and Canade observe is that indicated in one part of the Vedas as being the path which must be trodden in the pursuit of learning and study; viz., enunciation, definition, and investigation. Enunciation is the specification of a thing by its name, that is, by the expression denoting it, as revelation directs; for language is considered as revealed to man. Definition sets forth the particular quality which constitutes the real character of a thing. Investigation consists in an inquiry into the adequacy and sufficiency of the definition. In conformity with this, the teachers of philosophy presuppose scientific terms, proceed to definitions and then come to the investigation of the thus premised subjects.” By the name, the ordinary conception is indicated, and with it what is given in definition is compared in investigation. What comes next is the object to be contemplated. “Gotama here adduces sixteen points, amongst which proof, evidence” (which is formal), “and what has to be proved, are the principal; the others are merely subsidiary and accessory, as contributing to the knowledge and confirmation of the truth. The Nyaya concurs with the other psychological schools in this, that it promises happiness, final excellence, and freedom

from evil as the reward of a perfect knowledge of the principles which it teaches, that is to say, of the Truth, meaning the conviction of the eternal existence of the soul as separable from body," which makes spirit independent. Soul then is itself the object which is to be known and proved. This has still to be shown more particularly.

a. The first point of importance, the evidence brought forth as proof, is said to be divided into four kinds: — first of all, perception; secondly, inference, of which there are three kinds, viz. inference from result to cause, that from cause to effect, and that derived from analogy. The third kind of evidence is comparison, the fourth, trustworthy authority, including both tradition and the revelation implied in it. These kinds of proof are much brought forward, both in the ancient Treatise ascribed to Gotama and in innumerable commentaries.

b. The second point of importance is found in the subjects which have to be proved, and which have to be made evident; and of these twelve are here given. The first and most important is, however, the soul, as the seat, distinguished from the body and from the senses, of feeling and of knowledge, the existence of which is proved through inclination, disinclination, will, &c. It has fourteen qualities: number, size, individuality, connection, separation, intelligence, pleasure, pain, desire, dislike, will, merit, fault, and imagination. We see in this first commencement of reflection, which is quite without order, neither connection nor any totality of determinations. The second object of knowledge is body; the third, the organs of sensation, as the five outward senses are called. These are not modifications of consciousness, as the Sanc'hya asserts, but matter constructed out of the elements, which respectively consist of earth, water, light, air, and ether. The pupil of the eye is not, they say, the organ of sight, nor the ear of hearing, but the organ of seeing is a ray of light that proceeds from the eye to the object; the organ of hearing is the ether that in the cavity

of the ear communicates with the object heard, through the ether that is found between. The ray of light is usually invisible, just as a light is not seen at mid-day, but in certain circumstances it is visible. In taste, a watery substance like saliva is the organ, and so on. We find something similar to what is here said about sight in Plato's Timæus (pp. 45, 46, Steph.; pp. 50-53, Bekk.); there are interesting remarks upon the phosphorus of the eyes in a paper by Schultz, contained in Goethe's Morphology. Examples of men seeing at night, so that their eyes lighted up the object, are brought forward in numbers, but the demonstration certainly demands particular conditions. The objects of sense form the fourth subject. Here Cesava, a commentator, inserts the categories of Canade, of which there are six. The first of these is substance, and of this there are nine kinds: earth, water, light, air, ether, time, space, soul, understanding. The fundamental elements of material substances are by Canade regarded as if they were original atoms, and afterwards aggregates of the same; he maintains the everlasting nature of atoms, and thus much is adduced about the union of atoms, by which means motes are also produced. The second category is that of Quality, and of it there are twenty-four kinds, viz. 1, colour; 2, taste; 3, smell; 4, tangibility; 5, numbers; 6, size; 7, individuality; 8, conjunction; 9, separation; 10, priority; 11, posteriority; 12, weight; 13, fluidity; 14, viscidity; 15, sound; 16, intelligence; 17, pleasure; 18, pain; 19, desire; 20, dislike; 21, will; 22, virtue; 23, vice; 24, a capacity which includes three different qualities, viz. celerity, elasticity, and power of imagination. The third category is action; the fourth, association of qualities; the fifth, distinction; the sixth, is aggregation, and, according to Canade, this is the last; other writers add negation as the seventh. This is the manner in which philosophy is regarded by the Indians.

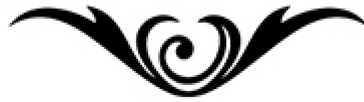
c. The philosophy of Gotama makes doubt the third topic, succeeding those of the evidence of knowledge, and the subjects of interest to

knowledge. Another topic is regular proof, formal reasoning, or the perfect syllogism (Nyaya), which consists of five propositions: — 1, the proposition; 2, the reason; 3, the instance; 4, the application; 5, the conclusion. To take examples: — 1. This hill is burning; 2, because it smokes; 3, what smokes is burning, like a kitchen fire; 4, accordingly the hill smokes; 5, therefore it is on fire. This is propounded as syllogisms are with us, but in the manner adopted, the matter which is in point is propounded first. We should, on the contrary, begin with the general. This is the ordinary form, and these examples may satisfy us, yet we shall recapitulate the matter once more.

We have seen that in India the point of main importance is the soul's drawing itself within itself, raising itself up into liberty, or thought, which constitutes itself for itself. This becoming explicit of soul in the most abstract mode may be called intellectual substantiality, but here it is not the unity of mind and nature that is present, but directly the opposite. To mind, the consideration of nature is only the vehicle of thought or its exercise, which has as its aim the liberation of mind. Intellectual substantiality is in India the end, while in Philosophy it is in general the true commencement; to philosophize is the idealism of making thought, in its own right, the principle of truth. Intellectual substantiality is the opposite of the reflection, understanding, and the subjective individuality of the European. With us it is of importance that I will, know, believe, think this particular thing according to the grounds that I have for so doing, and in accordance with my own free will; and upon this an infinite value is set. Intellectual substantiality is the other extreme from this; it is that in which all the subjectivity of the "I" is lost; for it everything objective has become vanity, there is for it no objective truth, duty or right, and thus subjective vanity is the only thing left. The point of interest is to reach intellectual substantiality

in order to drown in it that subjective vanity with all its cleverness and reflection. This is the advantage of arriving at this point of view.

The defect in such a view is that because intellectual substantiality, while represented as end and aim for the subject, as a condition that has to be produced in the interest of the subject, even though it be most objective, is yet only quite abstractly objective; and hence the essential form of objectivity is wanting to it. That intellectual substantiality that thus remaining in abstraction, has as its existence the subjective soul alone. Just as in empty vanity, where the subjective power of negation alone remains, everything disappears, this abstraction of intellectual substantiality only signifies an escape into what is empty and without determination, wherein everything vanishes. Therefore what remains to be done is to force forward the real ground of the inwardly self-forming and determining objectivity — the eternal form within itself, which is what men call Thought. Just as this Thought in the first place, as subjective, is mine, because I think, but in the second place is universality which comprehends intellectual substantiality, it is likewise in the third place forming activity, the principle of determination. This higher kind of objectivity that unfolds itself, alone gives a place to the particular content, allows it to have free scope and receives it into itself. If in the Oriental view, the particular shakes and is destined to fall, it still has its place grounded on thought. It is able to root itself in itself, it is able to stand firm, and this is the hard European understanding. Such Eastern ideas tend to destroy it, but it is preserved active in the soil of thought; it cannot exist when regarded as independent, but must exist only as a moment in the whole system. In the Eastern Philosophy we have also discovered a definite content, which is brought under our consideration; but the consideration is destitute of thought or system because it comes from above and is outside of the unity. On that side there stands intellectual substantiality, on this side it appears dry and barren; the particular thus only



has the dead form of simple reason and conclusion, such as we find in the Scholastics. Based on the ground of thought, on the other hand, the particular may receive its dues; it may be regarded and grasped as a moment in the whole organization. The Idea has not become objective in the Indian Philosophy; hence the external and objective has not been comprehended in accordance with the Idea. This is the deficiency in Orientalism.

The true, objective ground of thought finds its basis in the real freedom of the subject; the universal or substantial must itself have objectivity. Because thought is this universal, the ground of the substantial and likewise "I" — thought is the implicit and exists as the free subject — the universal has immediate existence and actual presence; it is not only an end or condition to be arrived at, but the absolute character is objective. It is this principle that we find in the Greek world, and the object of our further consideration is its development. The universal first appears as quite abstract, and as such it confronts the concrete world; but its value is both for the ground of the concrete world and for that which is implicit. It is not a beyond, for the value of the present lies in the fact that it exists in the implicit; or that which is implicit, the universal, is the truth of present objects.

PART ONE
GREEK PHILOSOPHY

PART ONE. GREEK PHILOSOPHY

INTRODUCTION

THE NAME OF Greece strikes home to the hearts of men of education in Europe, and more particularly is this so with us Germans. Europeans have taken their religion, the life to come, the far-off land, from a point somewhat further off than Greece — they took it from the East, and more especially from Syria. But the here, the present, art and science, that which in giving liberty to our spiritual life, gives it dignity as it likewise bestows upon it ornament, we know to have proceeded from Greece either directly or indirectly — through the circuitous road of Rome. The latter of these two ways was the earlier form in which this culture came to us; it also came from the formerly universal church which derived its origin as such from Rome, and has retained its speech even until now. The sources of authority in addition to the Latin Gospels have been the Fathers. Our law, too, boasts of deriving its most perfect forms from Rome. Teutonic strength of mind has required to pass through the hard discipline of the church and law which came to us from Rome, and to be kept in check; it is in this way that the European character first obtained its pliability and capacity for freedom. Thus it was after European manhood came to be at home with itself and to look upon the present, that the historical and that which is of foreign derivation was given. When man began to be at home with himself, he turned to the Greeks to find enjoyment in it. Let us leave the Latin and the Roman to the church and to jurisprudence. Higher, freer philosophic science, as also the beauty of our untrammelled art, the taste for, and love of the same, we know to have taken their root in Greek life and to have created therefrom their spirit. If we were to have an aspiration, it would be for such a land and such conditions.

But what makes us specially at home with the Greeks is that they made their world their home; the common spirit of homeliness unites us both. In ordinary life we like best the men and families that are homely and contented in themselves, not desiring what is outside and above them, and so it is with the Greeks. They certainly received the substantial beginnings of their religion, culture, their common bonds of fellowship, more or less from Asia, Syria and Egypt; but they have so greatly obliterated the foreign nature of this origin, and it is so much changed, worked upon, turned round, and altogether made so different, that what they, as we, prize, know, and love in it, is essentially their own. For this reason, in the history of Greek life, when we go further back and seem constrained so to go back, we find we may do without this retrogression and follow within the world and manners of the Greeks, the beginnings, the germination and the progress of art and science up to their maturity, even seeing the origin of their decay — and this completely comprehended within their own range. For their spiritual development requires that which is received or foreign, as matter or stimulus only; in such they have known and borne themselves as men that were free. The form which they have given to the foreign principle is this characteristic breath of spirituality, the spirit of freedom and of beauty which can in the one aspect be regarded as form, but which in another and higher sense is simply substance.

They have thus not only themselves created the substantial in their culture and made their existence their own, but they have also held in reverence this their spiritual rebirth, which is their real birth. The foreign origin they have so to speak thanklessly forgotten, putting it in the background — perhaps burying it in the darkness of the mysteries which they have kept secret from themselves. They have not only done this, that is they have not only used and enjoyed all that they have brought forth and formed, but they have become aware of and thankfully and joyfully placed

before themselves this at-homeness (Heimathlichkeit) in their whole existence, the ground and origin of themselves, not merely existing in it, possessing and making use of it. For their mind, when transformed in this spiritual new birth, is just the living in their life, and also the becoming conscious of that life as it has become actual. They represent their existence as an object apart from themselves, which manifests itself independently and which in its independence is of value to them; hence they have made for themselves a history of everything which they have possessed and have been. Not only have they represented the beginning of the world — that is, of gods and men, the earth, the heavens, the wind, mountains and rivers — but also of all aspects of their existence, such as the introduction of fire and the offerings connected with it, the crops, agriculture, the olive, the horse, marriage, property, laws, arts, worship, the sciences, towns, princely races, &c. Of all these it is pleasingly represented through tales how they have arisen in history as their own work.

It is in this veritable homeliness, or, more accurately, in the spirit of homeliness, in this spirit of ideally being-at-home-with-themselves in their physical, corporate, legal, moral and political existence; it is in the beauty and the freedom of their character in history, making what they are to be also a sort of Mnemosyne with them, that the kernel of thinking liberty rests; and hence it was requisite that Philosophy should arise amongst them. Philosophy is being at home with self, just like the homeliness of the Greek; it is man's being at home in his mind, at home with himself. If we are at home with the Greeks, we must be at home more particularly in their Philosophy; not, however, simply as it is with them, for Philosophy is at home with itself, and we have to do with Thought, with what is most specially ours, and with what is free from all particularity. The development and unfolding of thought has taken place with them from its earliest

beginning, and in order to comprehend their Philosophy we may remain with them without requiring to seek for further and external influences.

But we must specify more particularly their character and point of view. The Greeks have a starting-point in history as truly as they have arisen from out of themselves: this starting-point, comprehended in thought, is the oriental substantiality of the natural unity between the spiritual and the natural. To start from the self, to live in the self, is the other extreme of abstract subjectivity, when it is still empty, or rather has made itself to be empty; such is pure formalism, the abstract principle of the modern world. The Greeks stand between both these extremes in the happy medium; this therefore is the medium of beauty, seeing that it is both natural and spiritual, but yet that the spiritual still remains the governing, determining subject. Mind immersed in nature is in substantial unity with it, and in so far as it is consciousness, it is essentially sensuous perception: as subjective consciousness it is certainly form-giving though it is devoid of measure. For the Greeks, the substantial unity of nature and spirit was a fundamental principle, and thus being in the possession and knowledge of this, yet not being overwhelmed in it, but having retired into themselves, they have avoided the extreme of formal subjectivity, and are still in unity with themselves. Thus it is a free subject which still possesses that original unity in content, essence and substratum, and fashions its object into beauty. The stage reached by Greek consciousness is the stage of beauty. For beauty is the ideal; it is the thought which is derived from Mind, but in such a way that the spiritual individuality is not yet explicit as abstract subjectivity that has then in itself to perfect its existence into a world of thought. What is natural and sensuous still pertains to this subjectivity, but yet the natural form has not equal dignity and rank with the other, nor is it predominant as is the case in the East. The principle of the spiritual now stands first in rank, and natural existence has no further value for itself, in its existent forms,

being the mere expression of the Mind shining through, and having been reduced to be the vehicle and form of its existence. Mind, however, has not yet got itself as a medium whereby it can represent itself in itself, and from which it can form its world.

Thus free morality could and necessarily did find a place in Greece, for the spiritual substance of freedom was here the principle of morals, laws and constitutions. Because the natural element is, however, still contained in it, the form taken by the morality of the state is still affected by what is natural; the states are small individuals in their natural condition, which could not unite themselves into one whole. Since the universal does not exist in independent freedom, that which is spiritual still is limited. In the Greek world what is potentially and actually eternal is realized and brought to consciousness through Thought; but in such a way that subjectivity confronts it in a determination which is still accidental, because it is still essentially related to what is natural; and in this we find the reason as promised above, for the fact that in Greece the few alone are free.

The measureless quality of substance in the East is brought, by means of the Greek mind, into what is measurable and limited; it is clearness, aim, limitation of forms, the reduction of what is measureless, and of infinite splendour and riches, to determinateness and individuality. The riches of the Greek world consist only of an infinite quantity of beautiful, lovely and pleasing individualities in the serenity which pervades all existence; those who are greatest amongst the Greeks are the individualities, the connoisseurs in art, poetry, song, science, integrity and virtue. If the serenity of the Greeks, their beautiful gods, statues, and temples, as well as their serious work, their institutions and acts, may seem — compared to the splendour and sublimity, the colossal forms of oriental imagination, the Egyptian buildings of Eastern kingdoms — to be like child's play, this is the case yet more with the thought that comes into existence here. Such thought

puts a limit on this wealth of individualities as on the oriental greatness, and reduces it into its one simple soul, which, however, is in itself the first source of the opulence of a higher ideal world, of the world of Thought.

"From out of thy passions, oh, man," exclaimed an ancient, "thou hast derived the materials for thy gods," just as the Easterns, and especially the Indians, did from the elements, powers and forms of Nature. One may add, "out of Thought thou takest the element and material for God." Thus Thought is the ground from which God comes forth, but it is not Thought in its commencement that constitutes the first principle from which all culture must be grasped. It is quite the other way. In the beginning, thought comes forth as altogether poor, abstract, and of a content which is meagre in comparison to that given to his subject by the oriental; for as immediate, the beginning is just in the form of nature, and this it shares with what is oriental. Because it thus reduces the content of the East to determinations which are altogether poor, these thoughts are scarcely worth observation on our part, since they are not yet proper thoughts, neither being in the form of, or determined as thought, but belonging really to Nature. Thus Thought is the Absolute, though not as Thought. That is, we have always two things to distinguish, the universal or the Notion, and the reality of this universal, for the question here arises as to whether the reality is itself Thought or Nature. We find in the fact that reality at first has still the immediate form and is only Thought potentially, the reason for commencing with the Greeks and from the natural philosophy of the Ionic school.

As regards the external and historical condition of Greece at this time, Greek philosophy commences in the sixth century before Christ in the time of Cyrus, and in the period of decline in the Ionic republics in Asia Minor. Just because this world of beauty which raised itself into a higher kind of culture went to pieces, Philosophy arose. Crœsus and the Lydians first brought Ionic freedom into jeopardy; later on the Persians were those who

destroyed it altogether, so that the greater part of the inhabitants sought other spots and created colonies, more particularly in the West. At the time of the decline in Ionic towns, the other Greece ceased to be under its ancient lines of kings; the Pelopideans and the other, and for the most part foreign, princely races had passed away. Greece had in many ways come into touch with the outside world and the Greek inhabitants likewise sought within themselves for a bond of fellowship. The patriarchal life was past, and in many states it came to be a necessity that they should constitute themselves as free, organized and regulated by law. Many individuals come into prominence who were no more rulers of their fellow-citizens by descent, but who were by means of talent, power of imagination and scientific knowledge, marked out and reverenced, and such individuals came into many different relations with their fellows. Part of them became advisers, but their advice was frequently not followed; part of them were hated and despised by their fellow-citizens, and they drew back from public affairs; others became violent, if not fierce governors of the other citizens, and others again finally became the administrators of liberty.

The Seven Sages. Amongst these men just characterized, the seven sages — in modern times excluded from the history of Philosophy — take their place. In as far as they may be reckoned as milestones in the history of Philosophy, something about their character should, in the commencement of Philosophy, be shortly said. They came into prominence, partly as taking part in the battles of the Ionic towns, partly as expatriated, and partly as individuals of distinction in Greece. The names of the seven are given differently: usually, however, as Thales, Solon, Periander, Cleobulus, Chilon, Bias, Pittacus. Hermippus in Diogenes Laertius (1, 42) specifies seventeen, and, amongst these, various people pick out seven in various ways. According to Diogenes Laertius (1, 41) Dicæarchus, who came still

earlier in history, only names four, and these are placed amongst the seven by all; they are Thales, Bias, Pittacus and Solon. Besides these, Myson, Anacharsis, Acusilaus, Epimenides, Pherecydes, &c., are mentioned. Dicæarchus in Diogenes (1, 40), says of them that they are neither wise men (*σοφούς*) nor philosophers, but men of understanding (*συνετξύς*) and law-givers; this judgment has become the universal one and is held to be just. They come in a period of transition amongst the Greeks — a transition from a patriarchal system of kings into one of law or force. The fame of the wisdom of these men depends, on the one hand, on the fact that they grasped the practical essence of consciousness, or the consciousness of universal morality as it is in and for itself, giving expression to it in the form of moral maxims and in part in civil laws, making these actual in the state; on the other hand it depends on their having, in theoretic form, expressed the same in witty sayings. Some of these sayings could not merely be regarded as thoughtful or good reflections, but in so far, as philosophic and speculative; they have a comprehensive, universal significance ascribed to them, which, however, does not explain them. These men have not really made science and Philosophy their aim; it is expressly said of Thales that it was in the latter part of his life that he first took to Philosophy. What had relation to politics appeared most frequently; they were practical men, men of affairs, but not in our sense of the word; with us practical activity devotes itself to a special line of administration or to a particular business, or to economics, &c. They lived in democratic states and thus shared the responsibilities of the general administration and rule. They were not statesmen like the great Greek personalities, like Miltiades, Themistocles, Pericles and Demosthenes, but they were statesmen in a time when safety, preservation and, indeed, the whole well-being, disposition and well nigh the very foundation of civic life were in

question; and certainly when this was so with the foundations of legally established institutions.

Thales and Bias thus appear as the representatives of the Ionic towns. Herodotus (I. 169-171) speaks of both, and says of Thales that he advised even before the overthrow of the Ionians (apparently through Crœsus), that they should constitute a supreme council (*ἓν βουλευτήριον*) in Teos, in the centre of the Ionian people, and thus make a federal state with a capital and principal federal town, so that they might still remain separate nations (*δῆμοι*) as before. However, they did not follow this advice, and this isolated and weakened them, and the result was their conquest; it has always been a difficult thing for the Greeks to give up their individuality. Later on, when Harpagus, the general of Cyrus who accomplished their overthrow, pressed in upon them, the Ionians took no better the most excellent advice of Bias of Priene, given them at the decisive moment when they were assembled at Panionium, "to go in a common fleet to Sardinia, there to found an Ionic state. By so doing they would escape servitude, be happy, and, inhabiting the largest island, subdue the others. But if they remained in Ionia there was no hope of liberty to be seen for them." Herodotus gives his corroboration to this advice— "If they had followed him they would have been the happiest of Greeks." Such things take place, but through force and not voluntarily.

We find the other sages under similar conditions. Solon was an administrator in Athens, and thereby became famous; few men have attained the honourable position of being a law-giver. Solon shares it with Moses, Lycurgus, Zaleucus, Numa, &c., alone. No individuals can be found amongst Teutonic peoples who possess the distinction of being the law-givers of their people. Nowadays there can be law-givers no longer; legal institutions and regulations are in modern times always ready to hand, and the little that can still be done by means of the law-giver and by law-making

assemblies is simply the further modification of details or making very insignificant additions. What is dealt with is the compilation, wording and perfecting of the particular only; and yet neither Solon and Lycurgus did more than respectively bring the Ionic mind and the Doric character — being that which had been given them and which was implicitly present — into the form of consciousness, and obviate the temporary inconvenience of disorder through effective laws. Solon was thus not a perfect statesman; this is manifest from the sequel of his history. A constitution which allowed Pisistratus in Solon's own time to raise himself into the Tyranny, showing itself to be so destitute of strength and organization that it could not prevent its own overthrow, (and by what a power!) manifests some inward want. This may seem strange, for a constitution must be able to afford resistance to such an attack. But let us see what Pisistratus did.

What the so-called tyrants really were, is most clearly shown by the relation borne by Solon to Pisistratus. When orderly institutions and laws were necessary to the Greeks, we find law-givers and regents of states appearing, who laid down laws, and ruled accordingly. The law, as universal, seemed and still seems now to the individual to be force, inasmuch as he does not have regard to or comprehend the law: it applies first to all the people, and then only, to the individual; it is essential first of all to use constraint until the individual attains discernment, and law to him becomes his law, and ceases to be something foreign. Most of the law-givers and administrators of states undertook themselves to constrain the people and to be their tyrants. In states where they did not undertake it, it had to be done by other individuals, for it was essential. According to Diogenes Laertius' account (I. 48-50), we find Solon — whom his friends advised to secure the mastery for himself since the people held to him (*προσεῖχον*), and would have liked to see him become tyrant — repulse them, and try to prevent any such occurrence, when he became suspicious

of Pisistratus' intentions. What he did when he remarked upon the attitude of Pisistratus, was to come into the assembly of the people, and tell them the design of Pisistratus, accoutred in armour and shield; this was then unusual, for Thucydides (1, 6) makes it a distinguishing feature between Greeks and Barbarians, that the former, and pre-eminently the Athenians, put aside their arms in time of peace. He said, "Men of Athens, I am wiser than some and braver than others: I am wiser than those who do not see the deceit of Pisistratus, braver than those who certainly see it, but say nothing from fear." As he could not do anything, he left Athens. Pisistratus is said to have then written a most honourable letter to Solon in his absence, which Diogenes (I. 53, 54) has preserved for us, inviting him to return to Athens, and live with him as a free citizen. "Not only am I not the only one of the Greeks to have seized the tyranny, but I have not taken anything which was not my due, for I am of the race of Codrus. I have only taken back to myself what the Athenians swore they would preserve to Codrus and his race, and yet took from them. Moreover I am doing no evil toward gods and men, but as thou hast given laws to the Athenians, I take care (*ἐπιτροπῶ*) that in civil life they shall carry them out (*πολιτεύειν*.) His son Hippias did the same. And these relations are carried out better than they would be in a democracy, for I allow nobody to do evil (*ὑβρίζειν*), and as Tyrant, I lay claim to no more (*πλεῖόν τι φέρομαι*) than such consideration and respect and specified gifts (*τὰ ῥητὰ γέρα*) as would have been offered to the kings in earlier times. Every Athenian gives the tenth part of his revenue, not to me, but towards the cost of the public offering, and besides for the commonwealth, and for use in case of war. I am not angry that thou hast disclosed my project. For thou didst it more out of love to the people than hate against me, and because thou didst not know how I would conduct my rule. For if thou hadst known this, thou wouldst have submitted to it willingly, and wouldst not have taken flight;" and so he goes on. Solon, in

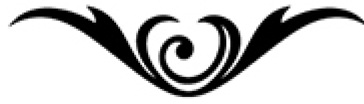
the answer given by Diogenes, (I. 66, 67) says, that he "has not a personal grudge against Pisistratus, and he must call him the best of tyrants; but to turn back does not befit him. For he made equality of rights essential in the Athenian constitution, and himself refused the tyranny. By his return he would condone what was done by Pisistratus." The rule of Pisistratus accustomed the Athenians to the laws of Solon, and brought them into usage, so that after this usage came to be general, supremacy was superfluous; his sons were hence driven out of Athens, and for the first time the constitution of Solon upheld itself. Solon undoubtedly gave the laws, but it is another thing to make such regulations effectual in the manners, habits and life of a people. What was separate in Solon and Pisistratus, we find united in Periander in Corinth, and Pittacus in Mitilene.

This may be enough about the outward life of the seven sages. They are also famed for the wisdom of the sayings which have been preserved to us; these sayings seem in great measure, however, to be superficial and hackneyed. The reason for this is found in the fact that, to our reflection, general propositions are quite usual; much in the Proverbs of Solomon seems to us to be superficial and commonplace for the same reason. But it is quite another thing to bring to the ordinary conception for the first time this same universal in the form of universality. Many distichs are ascribed to Solon which we still retain; their object is to express in maxims general obligations towards the gods, the family and the country. Diogenes (I. 58) tells us that Solon said: "Laws are like a spider's web; the small are caught, the great tear it up: speech is the image of action," &c. Such sayings are not philosophy, but general reflections, the expression of moral duties, maxims, necessary determinations. The wisdom of the sages is of this kind; many sayings are insignificant, but many seem to be more insignificant than they are. For instance, Chilon says: "Stand surety, and evil awaits thee" (*ἐγγύα, πάρα δ' ἄτα*). On the one hand this is quite a common rule of life and

prudence, but the sceptics gave to this proposition a much higher universal significance, which is also accredited to Chilon. This sense is, “Ally thyself closely to any particular thing, and unhappiness will fall upon thee.” The sceptics adduced this proposition independently, as demonstrating the principle of scepticism, which is that nothing is finite and definite in and for itself, being only a fleeting, vacillating phase which does not last. Cleobulus says, *μέτρον ἄριστον*, another *μηδὲν ἄγαν*, and this has likewise a universal significance which is that limitation, the *πέρας* of Plato as opposed to the *ἄπειρον* — the self-determined as opposed to undetermined — is what is best; and thus it is that in Being limit or measure is the highest determination.

One of the most celebrated sayings is that of Solon in his conversation with Crœsus, which Herodotus (I. 30-33) has in his own way given us very fully. The result arrived at is this:— “Nobody is to be esteemed happy before his death.” But the noteworthy point in this narrative is that from it we can get a better idea of the standpoint of Greek reflection in the time of Solon. We see that happiness is put forward as the highest aim, that which is most to be desired and which is the end of man; before Kant, morality, as eudæmonism, was based on the determination of happiness. In Solon’s sayings there is an advance over the sensuous enjoyment which is merely pleasant to the feelings. Let us ask what happiness is and what there is within it for reflection, and we find that it certainly carries with it a certain satisfaction to the individual, of whatever sort it be — whether obtained through physical enjoyment or spiritual — the means of obtaining which lie in men’s own hands. But the fact is further to be observed that not every sensuous, immediate pleasure can be laid hold of, for happiness contains a reflection on the circumstances as a whole, in which we have the principle to which the principle of isolated enjoyment must give way. Eudæmonism signifies happiness as a condition for the whole of life; it sets up a totality

of enjoyment which is a universal and a rule for individual enjoyment, in that it does not allow it to give way to what is momentary, but restrains desires and sets a universal standard before one's eyes. If we contrast it with Indian philosophy, we find eudæmonism to be antagonistic to it. There the liberation of the soul from what is corporeal, the perfect abstraction, the necessity that the soul shall, in its simplicity, be at home with itself, is the final end of man. With the Greeks the opposite is the case; the satisfaction there is also satisfaction of the soul, but it is not attained through flight, abstraction, withdrawal within self, but through satisfaction in the present, concrete satisfaction in relation to the surroundings. The stage of reflection that we reach in happiness, stands midway between mere desire and the other extreme, which is right as right and duty as duty. In happiness, the individual enjoyment has disappeared; the form of universality is there, but the universal does not yet come forth on its own account, and this is the issue of the conversation between Crœsus and Solon. Man as thinking, is not solely engrossed with present enjoyment, but also with the means for obtaining that to come. Crœsus points out to him these means, but Solon still objects to the statement of the question of Crœsus. For in order that any one should be conceived of as happy, we must await his death, for happiness depends upon his condition to the end, and upon the fact that his death should be a pious one and be consistent with his higher destiny. Because the life of Crœsus had not yet expired, Solon could not deem him happy. And the history of Crœsus bears evidence that no momentary state deserves the name of happiness. This edifying history holds in its embrace the whole standpoint of the reflection of that time.



Division of the Subject. In the consideration of Greek philosophy we have now to distinguish further three important periods: — in the first place the period from Thales to Aristotle; secondly, Greek philosophy in the Roman world; thirdly, the Neo-platonic philosophy.

1. We begin with thought, as it is in a quite abstract, natural or sensuous form, and we proceed from this to the Idea as determined. This first period shows the beginning of philosophic thought, and goes on to its development and perfection as a totality of knowledge in itself; this takes place in Aristotle as representing the unity of what has come before. In Plato there is just such a union of what came earlier, but it is not worked out, for he only represents the Idea generally. The Neo-platonists have been called eclectics, and Plato was said to have brought about the unity; they were not, however, eclectics, but they had a conscious insight into the necessity for uniting these philosophies.

2. After the concrete Idea was reached, it came forth as if in opposites, perfecting and developing itself. The second period is that in which science breaks itself up into different systems. A one-sided principle is carried through the whole conception of the world; each side is in itself formed into a totality, and stands in the relation of one extreme to another. The philosophical systems of Stoicism and Epicureanism are such; scepticism forms the negative to their dogmatism, while the other philosophies disappear.

3. The third period is the affirmative, the withdrawal of the opposition into an ideal world or a world of thought, a divine world. This is the Idea developed into totality, which yet lacks subjectivity as the infinite being-for-self.

SECTION ONE. First Period, from Thales to Aristotle

IN THIS FIRST period we shall again make three divisions: —

1. The first extends from Thales to Anaxagoras, from abstract thought which is in immediate determinateness to the thought of the self-determining Thought. Here a beginning is made with the absolutely simple, in which the earliest methods of determination manifest themselves as attempts, until the time of Anaxagoras; he determines the true as the *νοῦς*, and as active thought which no longer is in a determinate character, but which is self-determining.

2. The second division comprises the Sophists, Socrates, and the followers of Socrates. Here the self-determining thought is conceived of as present and concrete in me; that constitutes the principle of subjectivity if not also of infinite subjectivity, for thought first shows itself here only partly as abstract principle and partly as contingent subjectivity.

3. The third division, which deals with Plato and Aristotle, is found in Greek science where objective thought, the Idea, forms itself into a whole. The concrete, in itself determining Thought, is, with Plato, the still abstract Idea, but in the form of universality; while with Aristotle that Idea was conceived of as the self-determining, or in the determination of its efficacy or activity.

CHAPTER I. Period I. — Division I. — Thales to Anaxagoras

SINCE WE POSSESS only traditions and fragments of this epoch, we may speak here of the sources of these.

1. The first source is found in Plato, who makes copious reference to the older philosophers. For the reason that he makes the earlier and apparently independent philosophies, which are not so far apart when once their Notion is definitely grasped, into concrete moments of one Idea, Plato's philosophy often seems to be merely a clearer statement of the doctrines of the older philosophers, and hence it draws upon itself the reproach of plagiarism. Plato was willing to spend much money in procuring the writings of the older philosophers, and, from his profound study of these, his conclusions have much weight. But because in his writings he never himself appeared as teacher, but always represented other people in his dialogues as the philosophers, a distinction never has been made between what really belonged to them in history and what was added by him through the further development which he effected in their thoughts. In the Parmenides, for instance, we have the Eleatic philosophy, and yet the working out of this doctrine belongs peculiarly to Plato.

2. Aristotle is our most abundant authority; he studied the older philosophers expressly and most thoroughly, and he has, in the beginning of his Metaphysics especially, and also to a large extent elsewhere, dealt with them, in historical order: he is as philosophic as erudite, and we may rely upon him. We can do no better in Greek philosophy than study the first book of his Metaphysics. When the would-be-wise man depreciates Aristotle, and asserts that he has not correctly apprehended Plato, it may be

retorted that as he associated with Plato himself, with his deep and comprehensive mind, perhaps no one knew him better.

3. Cicero's name may also occur to us here — although he certainly is but a troubled spring — since he undoubtedly gives us much information; yet because he was lacking in philosophic spirit, he understood Philosophy rather as if it were a matter of history merely. He does not seem to have himself studied its first sources, and even avows that, for instance, he never understood Heraclitus; and because this old and deep philosophy did not interest him, he did not give himself the trouble to study it. His information bears principally on later philosophers — the Stoics, Epicureans, the new Academy, and the Peripatetics. He saw what was ancient through their medium, and, generally speaking, through a medium of reasoning and not of speculation.

4. Sextus Empiricus, a later sceptic, has importance through his writings, *Hypotyposes Pyrrhonicæ* and *adversus Mathematicos*. Because, as a sceptic, he both combated the dogmatic philosophy and also adduced other philosophers as testifying to scepticism (so that the greater part of his writings is filled with the tenets of other philosophers), he is the most abundant source we have for the history of ancient philosophy, and he has retained for our use many valuable fragments.

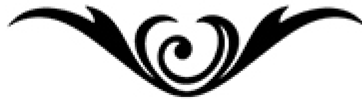
5. The book of Diogenes Laertius (*De vitis*, &c., Philoss. lib. x., ed. Meibom. c. notis Menagii, Amstel. 1692) is an important compilation, and yet it brings forward copious evidence without much discrimination. A philosophic spirit cannot be ascribed to it; it rambles about amongst bad anecdotes extraneous to the matter in hand. For the lives of philosophers, and here and there for their tenets, it is useful.

6. Finally, we must speak of Simplicius, a later Greek, from Cilicia, living under Justinian, in the middle of the sixth century. He is the most learned and acute of the Greek commentators of Aristotle, and of his

writings there is much still unpublished: to him we certainly owe our thanks.

I need give no more references, for they may be found without trouble in any compendium. In the progress of Greek philosophy men were formerly accustomed to follow the order that showed, according to ordinary ideas, an external connection, and which is found in one philosopher having had another as his teacher — this connection is one which might show him to be partly derived from Thales and partly from Pythagoras. But such a connection is in part defective in itself, and in part it is merely external. The one set of philosophic sects, or of philosophers classed together, which is considered as belonging to a system — that which proceeds from Thales — pursues its course in time and mind far separate from the other. But, in truth, no such series ever does exist in this isolation, nor would it do so even though the individuals were consecutive and had been externally connected as teacher and taught, which never is the case; mind follows quite another order. These successive series are interwoven in spirit just as much as in their particular content.

We come across Thales first amongst the Ionic people, to whom the Athenians belonged, or from whom the Ionians of Asia Minor, as a whole, derived their origin. The Ionic race appears earlier in Peloponnesus, but seems to have been removed from thence. It is, however, not known what nations belonged to it, for, according to Herodotus (I. 143), the other Ionians, and even the Athenians, laid aside the name. According to Thucydides (I. 2 and 12), the Ionic colonies in Asia Minor and the islands proceeded principally from Athens, because the Athenians, on account of the over-population of Attica, migrated there. We find the greatest activity in Greek life on the coasts of Asia Minor, in the Greek islands, and then towards the west of Magna Græcia; we see amongst these people, through their internal political activity and their intercourse with foreigners, the



existence of a diversity and variety in their relations, whereby narrowness of vision is done away with, and the universal rises in its place. These two places, Ionia and Greater Greece, are thus the two localities where this first period in the history of Philosophy plays its part until the time when, that period being ended, Philosophy plants itself in Greece proper, and there makes its home. Those spots were also the seat of early commerce and of an early culture, while Greece itself, so far as these are concerned, followed later.

We must thus remark that the character of the two sides into which these philosophies divide, the philosophy of Asia Minor in the east and that of Grecian Italy in the west, partakes of the character of the geographical distinction. On the Asia Minor side, and also in the islands, we find Thales, Anaximander, Anaximenes, Heraclitus, Leucippus, Democritus, Anaxagoras, and Diogenes from Crete. On the other side are the inhabitants of Italy: Pythagoras from Samos, who lived in Italy, however; Xenophanes, Parmenides, Zeno, Empedocles; and several of the Sophists also lived in Italy. Anaxagoras was the first to come to Athens, and thus his science takes a middle place between both extremes, and Athens was made its centre. The geographical distinction makes its appearance in the manifestation of Thought, in the fact that, with the Orientals a sensuous, material side is dominant, and in the west, Thought, on the contrary, prevails, because it is constituted into the principle in the form of thought. Those philosophers who turned to the east knew the absolute in a real determination of nature, while towards Italy there is the ideal determination of the absolute. These explanations will be sufficient for us here; but Empedocles, whom we find in Sicily, is somewhat of a natural philosopher, while Gorgias, the Sicilian sophist, remains faithful to the ideal side.

We now have to consider further: — 1, The Ionians, viz. Thales, Anaximander, Anaximenes; 2, Pythagoras and his followers; 3, the Eleatics,

viz. Xenophanes, Parmenides, &c.; 4, Heraclitus; 5, Empedocles, Leucippus and Democritus; 6, Anaxagoras. We have to trace and point out the progression of this philosophy also. The first and altogether abstract determinations are found with Thales and the other Ionians; they grasped the universal in the form of a natural determination, as water and air. Progression must thus take place by leaving behind the merely natural determination; and we find that this is so with the Pythagoreans. They say that number is the substance or the essence of things; number is not sensuous, nor is it pure thought, but it is a non-sensuous object of sense. It was with the Eleatics that pure thought appeared, and that its forcible liberation from the sensuous form and the form of number came to pass; and thus from them proceeds the dialectic movement of thought, which negates the definite particular in order to show that it is not the many but only the one that is true. Heraclitus declares the Absolute to be this very process, which, according to the Eleatics, was still subjective; he arrived at objective consciousness, since in it the Absolute is that which moves or changes. Empedocles, Leucippus, and Democritus, on the contrary, rather go to the opposite extreme, to the simple, material, stationary principle, to the substratum which underlies the process; and thus this last, as being movement, is distinguished from it. With Anaxagoras it is the moving, self-determining thought itself that is then known as existence, and this is a great step forward.

A. The Ionic Philosophy.

HERE WE HAVE the earlier Ionic philosophy, which we desire to treat as shortly as possible; and this is so much the easier, that the thought contained in it is very abstract and barren. Other philosophers than Thales, Anaximander, and Anaximenes, only come under our consideration as names. We have no more than half a dozen passages in the whole of the early Ionic philosophy, and that makes it an easy study. Yet learning prides itself most upon the ancients, for we may be most learned about that of which we know the least.

1. *Thales.*

With Thales we, properly speaking, first begin the history of Philosophy. The life of Thales occurred at the time when the Ionic towns were under the dominion of Crœsus. Through his overthrow (Ol. 58, 1; 548 B.C.), an appearance of freedom was produced, yet the most of these towns were conquered by the Persians, and Thales survived the catastrophe only a few years. He was born at Miletus; his family is, by Diogenes (I. 22, 37), stated to be the Phœnician one of Thelides, and the date of his birth, according to the best calculation, is placed in the first year of the 35th Olympiad (640 B.C.), but according to Meiners it was a couple of Olympiads later (38th Olympiad, 629 B.C.). Thales lived as a statesman partly with Crœsus and partly in Miletus. Herodotus quotes him several times, and tells (I. 75) that, according to the narratives of the Greeks, when Crœsus went to battle against Cyrus and had difficulty in passing over the river Halys, Thales, who accompanied the army, diverted the river by a trench, which he made

in the form of a crescent behind the camp, so that it could then be forded. Diogenes (I. 25) says further of him as regards his relations to his country, that he restrained the men of Miletus from allying themselves with Crœsus when he went against Cyrus, and that hence, after the conquest of Crœsus, when the other Ionic States were subdued by the Persians, the inhabitants of Miletus alone remained undisturbed. Diogenes records, moreover (I. 23), that he soon withdrew his attention from the affairs of the State and devoted himself entirely to science.

Voyages to Phœnicia are recorded of him, which, however, rest on vague tradition; but that he was in Egypt in his old age seems undoubted.[19] There he was said to have learned geometry, but this would appear not to have been much, judging from the anecdote, which Diogenes (I. 24, 27) retails from a certain Hieronymus. It was to the effect that Thales taught the Egyptians to measure the height of their pyramids by shadow — by taking the relation borne by the height of a man to his shadow. The terms of the proportion are: as the shadow of a man is to the height of a man, so is the shadow of a pyramid to its height. If this were something new to the Egyptians, they must have been very far back in the theory of geometry. Herodotus tells (I. 74), moreover, that Thales foretold an eclipse of the sun that happened exactly on the day of the battle between the Medians and Lydians, and that he ascribed the rising of the Nile to the contrary Etesian winds, which drove back the waters.[20] We have some further isolated instances of, and anecdotes about his astronomical knowledge and works.[21] "In gazing at and making observations on the stars, he fell into a ditch, and the people mocked him as one who had knowledge of heavenly objects and yet could not see what lay at his own feet." The people laugh at such things, and boast that philosophers cannot tell them about such matters; but they do not understand that philosophers laugh at them, for they do not fall into a ditch just because they lie in one for all time, and because they cannot see

what exists above them. He also showed, according to Diogenes (I. 26), that a wise man, if he wishes, can easily acquire riches. It is more important that he fixed that the year, as solar year, should have 365 days. The anecdote of the golden tripod to be given to the wisest man, is recorded by Diogenes (I. 27-33); and it carries with it considerable weight, because he combines all the different versions of the story. The tripod was given to Thales or to Bias; Thales gave it to some one else, and thus it went through a circle until it again came to Thales; the latter, or else Solon, decided that Apollo was wisest, and sent it to Didyma or to Delphi. Thales died, according to Diogenes (I. 38), aged seventy-eight or ninety, in the 58th Olympiad; according to Tennemann (vol. i. p. 414), it was in Olympiad 59, 2 (543 B.C.), when Pythagoras came to Crotona. Diogenes relates that he died at one of the games, overcome by heat and thirst.

We have no writings by Thales, and we do not know whether he was in the habit of writing. Diogenes Laertius (I. 23, 34, 35) speaks of two hundred verses on astronomy, and some maxims, such as “It is not the many words that have most meaning.”

As to his philosophy, he is universally recognized as the first natural philosopher, but all one knows of him is little, and yet we seem to know the most of what there is. For since we find that the further philosophic progress of which his speculative idea was capable, and the understanding of his propositions, which they alone could have, make their first appearance and form particular epochs with the philosophers succeeding him, who may be recognized thereby, this development ascribed to Thales never took place with him at all. Thus if it is the case that a number of his other reflections have been lost, they cannot have had any particular speculative value; and his philosophy does not show itself to be an imperfect system from want of information about it, but because the first philosophy cannot be a system.

We must listen to Aristotle as regards these ancient philosophers, for he speaks most sympathetically of them. In the passage of most importance (Metaph. I. 3), he says: "Since it is clear that we must acquire the science of first causes (*ἐξ ἀρχῆς αἰτίν*), seeing that we say that a person knows a thing when he becomes acquainted with its cause, there are, we must recollect, four causes — Being and Form first (for the 'why' is finally led back to the Notion, but yet the first 'why' is a cause and principle); matter and substratum, second; the cause whence comes the beginning of movement, third; and fourth the cause which is opposed to this, the aim in view and the good (for that is the end of every origination). Hence we would make mention of those who have undertaken the investigation of Being before us, and have speculated regarding the Truth, for they openly advance certain principles and first causes. If we take them under our consideration, it will be of this advantage, so far as our present investigation goes, that we shall either find other kinds of causes or be enabled to have so much the more confidence in those just named. Most of the earliest philosophers have placed the principles of everything in something in the form of matter (*ἐν ὕλης εἴδει*), for, that from which everything existent comes, and out of which it takes its origin as its first source, and into which it finally sinks, as substance (*οὐσία*), ever remains the same and only changes in its particular qualities (*πάθεσι*); and this is called the element (*στοιχεῖον*) and this the principle of all that exists" (the absolute prius). "On this account they maintain that nothing arises or passes away, because the same nature always remains. For instance, we say that, absolutely speaking, Socrates neither originates if he becomes beautiful or musical, nor does he pass away if he loses these qualities, because the subject (*τὸ ὑποκείμενον*), Socrates, remains the same. And so it is with all else. For there must be one nature, or more than one, from which all else arises, because it maintains its

existence” (*σωζομένης ἐκείνης*), that means that in its change there is no reality or truth. “All do not coincide as to the number of this principle or as to its description (*εἶδος*); Thales, the founder of this philosophy,” (which recognizes something material as the principle and substance of all that is), “says that it is water. Hence he likewise asserts the earth to be founded on water.” Water is thus the *ὑποκείμενον*, the first ground, and, according to Seneca’s statement (Quæst. Nat. vi. 6), it seems to him to be not so much the inside of the earth, as what encloses it which is the universal existence; for “Thales considered that the whole earth has water as its support (*subjecto humore*), and that it swims thereon.”

We might first of all expect some explanation of the application of these principles, as, for example, how it is to be proved that water is the universal substance, and in what way particular forms are deduced from it. But as to this we must say that of Thales in particular, we know nothing more than his principle, which is that water is the god over all. No more do we know anything further of Anaximander, Anaximenes and Diogenes than their principles. Aristotle brings forward a conjecture as to how Thales derived everything directly out of water, “Perhaps (*ἴσως*) the conclusions of Thales have been brought about from the reflection that it was evident that all nourishment is moist, and warmth itself comes out of moisture and thereby life continues. But that from which anything generates is the principle of all things. This was one reason for holding this theory, and another reason is contained in the fact that all germs are moist in character, and water is the principle of what is moist.” It is necessary to remark that the circumstances introduced by Aristotle with a “perhaps” which are supposed to have brought about the conclusions of Thales, making water the absolute essence of everything, are not adduced as the grounds acknowledged by Thales. And furthermore, they can hardly be called grounds, for what Aristotle does is rather to establish, as we would say from actuality, that the latter

corresponds to the universal idea of water. His successors, as for instance Pseudo-Plutarch (De plac. phil. I. 3), have taken Thales' assertion as positive and not hypothetical; Tiedmann (*Geist der spec. Phil.* vol. I. p. 36) remarks with great reason that Plutarch omits the "perhaps." For Plutarch says, "Thales suggests (*στοχάζεται*) that everything takes its origin from water and resolves itself into the same, because as the germs of all that live have moisture as the principle of life, all else might likewise (*εἰκός*) take its principle from moisture; for all plants draw their nourishment, and thus bear fruit, from water, and if they are without it, fade away; and even the fires of sun, and stars and world are fed through the evaporation of water." Aristotle is contented with simply showing in regard to moisture that, at least, it is everywhere to be found. Since Plutarch gives more definite grounds for holding that water is the simple essence of things, we must see whether things, in so far as they are simple essence, are water, (*α*) The germ of the animal, of moist nature, is undoubtedly the animal as the simple actual, or as the essence of its actuality, or undeveloped actuality. (*β*) If, with plants, water may be regarded as for their nourishment, nourishment is still only the being of a thing as formless substance that first becomes individualized by individuality, and thus succeeds in obtaining form. (*γ*) To make sun, moon and the whole world arise through evaporation, like the food of plants, certainly approximates to the idea of the ancients, who did not allow the sun and moon to have obtained independence as we do.

"There are also some," continues Aristotle, "who hold that all the ancients who, at the first and long before the present generation, made theology their study, understood Nature thus. They made Oceanus and Tethys the producers of all origination (*τῆς γενέσεως*), and water, which by the poets is called Styx, the oath of the gods. For what is most ancient is most revered, and the oath is that most held in reverence." This old tradition has within it speculative significance. If anything cannot be proved or is

devoid of objective form, such as we have in respect of payment in a discharge, or in witnesses who have seen the transaction, the oath, the confirmation of myself as object, expresses the fact that my assurance is absolute truth. Now since, by way of confirmation, men swear by what is best, by what is absolutely certain, and the gods swore by the subterranean water, it follows that the essence of pure thought, the inmost being, the reality in which consciousness finds its truth, is water; I, so to speak, express this clear certainty of myself as object, as God.

1. The closer consideration of this principle in its bearings would have no interest. For since the whole philosophy of Thales lies in the fact that water is this principle, the only point of interest can be to ask how far that principle is important and speculative. Thales comprehends essence as devoid of form. While the sensuous certitude of each thing in its individuality is not questioned, this objective actuality is now to be raised into the Notion that reflects itself into itself and is itself to be set forth as Notion; in commencement this is seen in the world's being manifested as water, or as a simple universal. Fluid is, in its Notion, life, and hence it is water itself, spiritually expressed; in the so-called grounds or reasons, on the contrary, water has the form of existent universal. We certainly grant this universal activity of water, and for that reason call it an element, a physical universal power; but while we find it thus to be the universal of activity, we also find it to be this actual, not everywhere, but in proximity to other elements — earth, air and fire. Water thus has not got a sensuous universality, but a speculative one merely; to be speculative universality, however, would necessitate its being Notion and having what is sensuous removed. Here we have the strife between sensuous universality and universality of the Notion. The real essence of nature has to be defined, that is, nature has to be expressed as the simple essence of thought. Now simple essence, the Notion of the universal, is that which is devoid of form, but this

water as it is, comes into the determination of form, and is thus, in relation to others, a particular existence just like everything that is natural. Yet as regards the other elements, water is determined as formless and simple, while the earth is that which has points, air is the element of all change, and fire evidently changes into itself. Now if the need of unity impels us to recognize for separate things a universal, water, although it has the drawback of being a particular thing, can easily be utilized as the One, both on account of its neutrality, and because it is more material than air.

The proposition of Thales, that water is the Absolute, or as the ancients say, the principle, is the beginning of Philosophy, because with it the consciousness is arrived at that essence, truth, that which is alone in and for itself, are one. A departure from what is in our sensuous perception here takes place; man recedes from this immediate existence. We must be able to forget that we are accustomed to a rich concrete world of thought; with us the very child learns, "There is one God in Heaven, invisible." Such determinations are not yet present here; the world of Thought must first be formed and there is as yet no pure unity. Man has nature before him as water, air, stars, the arch of the heavens; and the horizon of his ideas is limited to this. The imagination has, indeed, its gods, but its content still is natural; the Greeks had considered sun, mountains, earth, sea, rivers, &c., as independent powers, revered them as gods, and elevated them by the imagination to activity, movement, consciousness and will. What there is besides, like the conceptions of Homer, for instance, is something in which thought could not find satisfaction; it produces mere images of the imagination, endlessly endowed with animation and form, but destitute of simple unity. It must undoubtedly be said that in this unconsciousness of an intellectual world, one must acknowledge that there is a great robustness of mind evinced in not granting this plenitude of existence to the natural world, but in reducing it to a simple substance, which, as the ever enduring

principle, neither originates nor disappears, while the gods have a Theogony and are manifold and changing. This wild, endlessly varied imagination of Homer is set at rest by the proposition that existence is water; this conflict of an endless quantity of principles, all these ideas that a particular object is an independent truth, a self-sufficient power over others existing in its own right, are taken away, and it is shown likewise that there is only one universal, the universal self-existent, the simple unimaginative perception, the thought that is one and one alone.

This universal stands in direct relationship to the particular and to the existence of the world as manifested. The first thing implied in what has been said, is that the particular existence has no independence, is not true in and for itself, but is only an accidental modification. But the affirmative point of view is that all other things proceed from the one, that the one remains thereby the substance from which all other things proceed, and it is only through a determination which is accidental and external that the particular existence has its being. It is similarly the case that all particular existence is transient, that is, it loses the form of particular and again becomes the universal, water. The simple proposition of Thales therefore, is Philosophy, because in it water, though sensuous, is not looked at in its particularity as opposed to other natural things, but as Thought in which everything is resolved and comprehended. Thus we approach the divorce of the absolute from the finite; but it is not to be thought that the unity stands above, and that down here we have the finite world. This idea is often found in the common conception of God — where permanence is attributed to the world and where men often represent two kinds of actuality to themselves, a sensuous and a supersensuous world of equal standing. The philosophic point of view is that the one is alone the truly actual, and here we must take actual in its higher significance, because we call everything actual in common life. The second circumstance to be remembered is that with the

ancient philosophers, the principle has a definite and, at first, a physical form. To us this does not appear to be philosophic but only physical; in this case, however, matter has philosophic significance. Thales' theory is thus a natural philosophy, because this universal essence is determined as real; consequently the Absolute is determined as the unity of thought and Being.

2. Now if we have this undifferentiated principle predominating, the question arises as to the determination of this first principle. The transition from universal to particular at once becomes essential, and it begins with the determination of activity; the necessity for such arises here. That which is to be a veritable principle must not have a one-sided, particular form, but in it the difference must itself be absolute, while other principles are only special kinds of forms. The fact that the Absolute is what determines itself is already more concrete; we have the activity and the higher self-consciousness of the spiritual principle, by which the form has worked itself into being absolute form, the totality of form. Since it is most profound, this comes latest; what has first to be done is merely to look at things as determined.

Form is lacking to water as conceived by Thales. How is this accorded to it? The method is stated (and stated by Aristotle, but not directly of Thales), in which particular forms have arisen out of water; it is said to be through a process of condensation and rarefaction (*πυκνότητι καὶ μανότητι*), or, as it may be better put, through greater or less intensity. Tennemann (vol. I. p. 59) in reference to this, cites from Aristotle, *De gen. et corrupt.* I. 1, where there is no mention of condensation and rarefaction as regards Thales, and further, *De cœlo*, III. 5, where it is only said that those who uphold water or air, or something finer than water or coarser than air, define difference as density and rarity, but nothing is said of its being Thales who gave expression to this distinction. Tiedmann (vol. I. p. 38) quotes yet other authorities; it was, however, later on, that this distinction was first ascribed

to Thales.[22] Thus much is made out, that for the first time in this natural philosophy as in the modern, that which is essential in form is really the quantitative difference in its existence. This merely quantitative difference, however, which, as the increasing and decreasing density of water, constitutes its only form-determination, is an external expression of the absolute difference; it is an unessential distinction set up through another and is not the inner difference of the Notion in itself; it is therefore not worth while to spend more time over it.

Difference as regards the Notion has no physical significance, but differences or the simple duality of form in the sides of its opposition, must be comprehended as universally in the Notion. On this account a sensuous interpretation must not be given to the material, that is to particular determinations, as when it is definitely said that rare water is air, rare air, fiery ether, thick water, mud, which then becomes earth; according to this, air would be the rarefaction of the first water, ether the rarefaction of air, and earth and mud the sediment of water. As sensuous difference or change, the division here appears as something manifested for consciousness; the moderns have experimented in making thicker and thinner what to the senses is the same.

Change has consequently a double sense; one with reference to existence and another with reference to the Notion. When change is considered by the ancients, it is usually supposed to have to do with a change in what exists, and thus, for instance, inquiry would be made as to whether water can be changed through chemical action, such as heat, distillation, &c., into earth; finite chemistry is confined to this. But what is meant in all ancient philosophies is change as regards the Notion. That is to say, water does not become converted into air or space and time in retorts, &c. But in every philosophic idea, this transition of one quality into another takes place, *i.e.*

this inward connection is shown in the Notion, according to which no one thing can subsist independently and without the other, for the life of nature has its subsistence in the fact that one thing is necessarily related to the other. We certainly are accustomed to believe that if water were taken away, it would indeed fare badly with plants and animals, but that stones would still remain; or that of colours, blue could be abstracted without harming in the least yellow or red. As regards merely empirical existence, it may easily be shown that each quality exists on its own account, but in the Notion they only are, through one another, and by virtue of an inward necessity. We certainly see this also in living matter, where things happen in another way, for here the Notion comes into existence; thus if, for example, we abstract the heart, the lungs and all else collapse. And in the same way all nature exists only in the unity of all its parts, just as the brain can exist only in unity with the other organs.

3. If the form is, however, only expressed in both its sides as condensation and rarefaction, it is not in and for itself, for to be this it must be grasped as the *absolute Notion*, and as an endlessly forming unity. What is said on this point by Aristotle (De Anima, I. 2, also 5) is this: “Thales seems, according to what is said of him, to consider the soul as something having movement, for he says of the loadstone that it has a soul, since it moves the iron.” Diogenes Laertius (I. 24) adds amber to this, from which we see that even Thales knew about electricity, although another explanation of it is that *ἤλεκτρον* was besides a metal. Aldobrandini says of this passage in Diogenes, that it is a stone which is so hostile to poison that when touched by such it immediately hisses. The above remark by Aristotle is perverted by Diogenes to such an extent that he says: “Thales has likewise ascribed a soul to what is lifeless.” However, this is not the question, for the point is how he thought of absolute form, and whether he

expressed the Idea generally as soul so that absolute essence should be the unity of simple essence and form.

Diogenes certainly says further of Thales (I. 27), “The world is animated and full of demons,” and Plutarch (De plac. phil. I. 7) says, “He called God the Intelligence (*νοῦς*) of the world.” But all the ancients, and particularly Aristotle, ascribe this expression unanimously to Anaxagoras as the one who first said that the *νοῦς* is the principle of things. Thus it does not conduce to the further determination of form according to Thales, to find in Cicero (De Nat. Deor. I. 10) this passage: “Thales says that water is the beginning of everything, but God is the Mind which forms all that is, out of water.” Thales may certainly have spoken of God, but Cicero has added the statement that he comprehended him as the *νοῦς* which formed everything out of water. Tiedmann (vol. I. p. 42) declares the passage to be possibly corrupt, since Cicero later on (c. 11) says of Anaxagoras that “he first maintained the order of things to have been brought about through the infinite power of Mind.” However, the Epicurean, in whose mouth these words are put, speaks “with confidence only fearing that he should appear to have any doubts” (c. 8) both previously and subsequently of other philosophers rather foolishly, so that this description is given merely as a jest. Aristotle understands historic accuracy better, and therefore we must follow him. But to those who make it their business to find everywhere the conception of the creation of the world by God, that passage in Cicero is a great source of delight, and it is a much disputed point whether Thales is to be counted amongst those who accepted the existence of a God. The Theism of Thales is maintained by Plouquet, whilst others would have him to be an atheist or polytheist, because he says that everything is full of demons. However, this question as to whether Thales believed in God does not concern us here, for acceptation, faith, popular religion are not in question; we only have to do with the philosophic determination of absolute

existence. And if Thales did speak of God as constituting everything out of this same water, that would not give us any further information about this existence; we should have spoken unphilosophically of Thales because we should have used an empty word without inquiring about its speculative significance. Similarly the word world-soul is useless, because its being is not thereby expressed.

Thus all these further, as also later, assertions do not justify us in maintaining that Thales comprehended form in the absolute in a definite manner; on the contrary, the rest of the history of philosophical development refutes this view. We see that form certainly seems to be shown forth in existence, but as yet this unity is no further developed. The idea that the magnet has a soul is indeed always better than saying that it has the power of attraction; for power is a quality which is considered as a predicate separable from matter, while soul is movement in unison with matter in its essence. An idea such as this of Thales stands isolated, however, and has no further relation to his absolute thought. Thus, in fact, the philosophy of Thales is comprised in the following simple elements: (*a*) It has constituted an abstraction in order to comprehend nature in a simple sensuous essence. (*b*) It has brought forth the Notion of ground or principle; that is, it has defined water to be the infinite Notion, the simple essence of thought, without determining it further as the difference of quantity. That is the limited significance of this principle of Thales.

2. *Anaximander.*

Anaximander was also of Miletus, and he was a friend of Thales. "The latter," says Cicero (Acad. Quaest. IV. 37), "could not convince him that everything consisted of water." Anaximander's father was called Praxiades; the date of his birth is not quite certain; according to Tennemann (vol. I. p. 413), it is put in Olympiad 42, 3 (610 B.C.), while Diogenes Laertius (II. I,

2) says, taking his information from Apollodorus, an Athenian, that in Ol. 58, 2 (547 B.C.), he was sixty-four years old, and that he died soon after, that is to say about the date of Thales' death. And taking for granted that he died in his ninetieth year, Thales must have been nearly twenty-eight years older than Anaximander. It is related of Anaximander that he lived in Samos with the tyrant Polycrates, where were Pythagoras and Anacreon also. Themistius, according to Brucker (Pt. I. p. 478), says of him that he first put his philosophic thoughts into writing, but this is also recorded of others, as for example, of Pherecydes, who was older than he. Anaximander is said to have written about nature, the fixed stars, the sphere, besides other matters; he further produced something like a map, showing the boundary (*πρίμετρον*) of land and sea; he also made other mathematical inventions, such as a sun-dial that he put up in Lacedæmon, and instruments by which the course of the sun was shown, and the equinox determined; a chart of the heavens was likewise made by him.

His philosophical reflections are not comprehensive, and do not extend as far as to determination. Diogenes says in the passage quoted before: "He adduced the Infinite" (*τὸ ἄπειρον*, the undetermined), "as principle and element; he neither determined it as air or water or any such thing." There are, however, few attributes of this Infinite given. (*α.*) "It is the principle of all becoming and passing away; at long intervals infinite worlds or gods rise out of it, and again they pass away into the same." This has quite an oriental tone. "He gives as a reason that the principle is to be determined as the Infinite, the fact that it does not need material for continuous origination. It contains everything in itself and rules over all: it is divine, immortal, and never passes away."[23] (*β.*) Out of the one, Anaximander separates the opposites which are contained in it, as do Empedocles and Anaxagoras; thus everything in this medley is certainly there, but undetermined.[24] That is, everything is really contained therein in possibility (*δυνάμει*), "so that," says

Aristotle (Metaphys. XI. 2), “it is not only that everything arises accidentally out of what is not, but everything also arises from what is, although it is from incipient being which is not yet in actuality.” Diogenes Laertius adds (II. 1): “The parts of the Infinite change, but it itself is unchangeable.” (*γ*.) Lastly, it is said that the infinitude is in size and not in number, and Anaximander differs thus from Anaxagoras, Empedocles and the other atomists, who maintain the absolute discretion of the infinite, while Anaximander upholds its absolute continuity.[25] Aristotle (Metaphys. I. 8) speaks also of a principle which is neither water nor air, but is “thicker than air and thinner than water.” Many have connected this idea with Anaximander, and it is possible that it belongs to him.

The advance made by the determination of the principle as infinite in comprehensiveness rests in the fact that absolute essence no longer is a simple universal, but one which negates the finite. At the same time, viewed from the material side, Anaximander removes the individuality of the element of water; his objective principle does not appear to be material, and it may be understood as Thought. But it is clear that he did not mean anything else than matter generally, universal matter.[26] Plutarch reproaches Anaximander “for not saying what (*τι*) his infinite is, whether air, water or earth.” But a definite quality such as one of these is transient; matter determined as infinitude means the motion of positing definite forms, and again abolishing the separation. True and infinite Being is to be shown in this and not in negative absence of limit. This universality and negation of the finite is, however, our operation only: in describing matter as infinite, Anaximander does not seem to have said that this is its infinitude.

He has said further (and in this, according to Theophrastus, he agrees with Anaxagoras), “In the infinite the like separates itself from the unlike and allies itself to the like; thus what in the whole was gold becomes gold, what was earth, earth, &c., so that properly nothing originates, seeing that it

was already there."[27] These, however, are poor determinations, which only show the necessity of the transition from the undetermined to the determined; for this still takes place here in an unsatisfying way. As to the further question of how the infinite determines the opposite in its separation, it seems that the theory of the quantitative distinction of condensation and rarefaction was held by Anaximander as well as by Thales. Those who come later designate the process of separation from the Infinite as development. Anaximander supposes man to develop from a fish, which abandoned water for the land.[28] Development comes also into prominence in recent times, but as a mere succession in time — a formula in the use of which men often imagine that they are saying something brilliant; but there is no real necessity, no thought, and above all, no Notion contained in it.

But in later records the idea of warmth, as being the disintegration of form, and that of cold, is ascribed to Anaximander by Stobæus (Eclog. Phys. c. 24, p. 500); this Aristotle (Metaphys. I. 5) first ascribed to Parmenides. Eusebius (De præp. Evang. I. 8), out of a lost work of Plutarch, gives us something from Anaximander's Cosmogony which is dark, and which, indeed, Eusebius himself did not rightly understand. Its sense is approximately this: "Out of the Infinite, infinite heavenly spheres and infinite worlds have been set apart; but they carry within them their own destruction, because they only are through constant dividing off." That is, since the Infinite is the principle, separation is the positing of a difference, i.e. of a determination or something finite. "The earth has the form of a cylinder, the height of which is the third part of the breadth. Both of the eternally productive principles of warmth and cold separate themselves in the creation of this earth, and a fiery sphere is formed round the air encircling the earth, like the bark around a tree. As this broke up, and the pieces were compressed into circles, sun, moon, and stars were formed."

Hence Anaximander, according to Stobæus (Ecl. Phys. 25, p. 510), likewise called the stars "wheel-shaped with fire-filled wrappings of air." This Cosmogony is as good as the geological hypothesis of the earth-crust which burst open, or as Buffon's explosion of the sun, which beginning, on the other hand, with the sun, makes the planets to be stones projected from it. While the ancients confined the stars to our atmosphere, and made the sun first proceed from the earth, we make the sun to be the substance and birthplace of the earth, and separate the stars entirely from any further connection with us, because for us, like the gods worshipped by the Epicureans, they are at rest. In the process of origination, the sun, indeed, descends as the universal, but in nature it is that which comes later; thus in truth the earth is the totality, and the sun but an abstract moment.

3. *Anaximenes.*

Anaximenes still remains as having made his appearance between the 55th and 58th Olympiads (560-548 B.C.). He was likewise of Miletus, a contemporary and friend of Anaximander; he has little to distinguish him, and very little is known about him. Diogenes Laertius says neither with consideration nor consistency (II. 3): "He was born, according to Apollodorus in the 63rd Olympiad, and died in the year Sardis was conquered" (by Cyrus, Olympiad 58th).

In place of the undetermined matter of Anaximander, he brings forward a definite natural element; hence the absolute is in a real form, but instead of the water of Thales, that form is air. He found that for matter a sensuous being was indeed essential, and air has the additional advantage of being more devoid of form; it is less corporeal than water, for we do not see it, but feel it first in movement. Plutarch (De plac. phil. I. 3) says: "Out of it everything comes forth, and into it everything is again resolved." According to Cicero (De Nat. Deor. I. 10), "he defined it as immeasurable, infinite, and

in constant motion." Diogenes Laertius expresses this in the passage already quoted: "The principle is air and the infinite" (*οὗτος ἀρχὴν ἀέρα εἶπε καὶ τὸ ἄπειρον*) as if there were two principles; however, *ἀρχὴν καὶ ἄπειρον* may be taken together as subject, and *ἀέρα* regarded as the predicate in the statement. For Simplicius, in dealing with the Physics of Aristotle, expressly says (p. 6, a) "that the first principle was to him one and infinite in nature as it was to Anaximander, but it was not indefinite as with the latter, but determined, that is, it was air," which, however, he seems to have understood as endowed with soul.

Plutarch characterizes Anaximenes' mode of representation which makes everything proceed from air — later on it was called ether — and resolve itself therein, better thus: "As our soul, which is air, holds us together (*συγρατεῖ*), one spirit (*πνεῦμα*) and air together likewise hold (*περιέχει*) the whole world together; spirit and air are synonymous." Anaximenes shows very clearly the nature of his essence in the soul, and he thus points out what may be called the transition of natural philosophy into the philosophy of consciousness, or the surrender of the objective form of principle. The nature of this principle has hitherto been determined in a manner which is foreign and negative to consciousness; both its reality, water or air, and the infinite are a "beyond" to consciousness. But soul is the universal medium; it is a collection of conceptions which pass away and come forth, while the unity and continuity never cease. It is active as well as passive, from its unity severing asunder the conceptions and sublating them, and it is present to itself in its infinitude, so that negative signification and positive come into unison. Speaking more precisely, this idea of the nature of the origin of things is that of Anaxagoras, the pupil of Anaximenes.

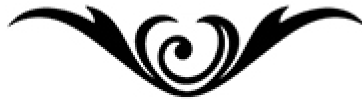
Pherecydes has also to be mentioned as the teacher of Pythagoras; he is of Syros, one of the Cyclades islands. He is said to have drawn water from a spring, and to have learned therefrom that an earthquake would take place

in three days; he is also said to have predicted of a ship in full sail that it would go down, and it sank in a moment. Theopompus in Diogenes Laertius (I. 116), relates of this Pherecydes that “he first wrote to the Greeks about Nature and the gods” (which was before said of Anaximander). His writings are said to have been in prose, and from what is related of them it is clear that it must have been a theogony of which he wrote. The first words, still preserved to us, are: “Jupiter and Time and what is terrestrial (*χθών*) were from eternity (*εἰς ἀεί*); the name of earthly (*χθονίη*) was given to the terrestrial sphere when Zeus granted to it gifts.”[29] How it goes on is not known, but this cannot be deemed a great loss. Hermias tells us only this besides:[30] “He maintained Zeus or Fire (*αἰθέρα*), Earth and Chronos or Time as principles — fire as active, earth as passive, and time as that in which everything originates.” Diogenes of Apollonia, Hippasus, and Archelaus are also called Ionic philosophers, but we know nothing more of them than their names, and that they gave their adherence to one principle or the other.

We shall leave these now and go on to Pythagoras, who was a contemporary of Anaximander; but the continuity of the development of the principle of physical philosophy necessitated our taking Anaximenes with him. We see that, as Aristotle said, they placed the first principle in a form of matter — in air and water first, and then, if we may so define Anaximander’s matter, in an essence finer than water and coarser than air. Heraclitus, of whom we have soon to speak, first called it fire. “But no one,” as Aristotle (Metaph. I. 8) remarks, “called earth the principle, because it appears to be the most complex element” (*διὰ τὴν μεγαλομέρειαν*); for it seems to be an aggregate of many units. Water, on the contrary, is the one, and it is transparent; it manifests in sensuous guise the form of unity with itself, and this is also so with air, fire, matter, &c. The principle has to be one, and hence must have inherent unity with itself; if it

shows a manifold nature as does the earth, it is not one with itself, but manifold. This is what we have to say about the early Ionic Philosophy. The importance of these poor abstract thoughts lies (*a*) in the comprehension of a universal substance in everything, and (*b*) in the fact that it is formless, and not encumbered by sensuous ideas.

No one recognized better the deficiencies in this philosophy than did Aristotle in the work already quoted. Two points appear in his criticism of these three modes of determining the absolute: “Those who maintain the original principle to be matter fall short in many ways. In the first place, they merely give the corporeal element and not the incorporeal, for there also is such.” In treating of nature in order to show its essence, it is necessary to deal with it in its entirety, and everything found in it must be considered. That is certainly but an empirical instance. Aristotle maintains the incorporeal to be a form of things opposed to the material, and indicates that the absolute must not be determined in a one-sided manner; because the principle of these philosophers is material only, they do not manifest the incorporeal side, nor is the object shown to be Notion. Matter is indeed itself immaterial as this reflection into consciousness; but such philosophers do not know that what they express is an existence of consciousness. Thus the first great defect here rests in the fact that the universal is expressed in a particular form.



Secondly, Aristotle says (Metaph. I. 3): “From this it may be seen that first cause has only been by all these expressed in the form of matter. But because they proceeded thus, the thing itself opened out their way for them, and forced them into further investigation. For whether origin and decay are derived from one or more, the question alike arises, ‘How does it happen and what is the cause of it?’ For the fundamental substance (*τὸ ὑποκείμενον*) does not make itself to change, just as neither wood nor metal are themselves the cause of change; wood neither forms a bed nor does

brass a statue, but something else is the cause of the change. To investigate this, however, is to investigate the other principle, which, as we would say, is the Principle of Motion." This criticism holds good even now, where the Absolute is represented as the one fixed substance. Aristotle says that change is not conceivable out of matter as such, or out of water not itself having motion; he reproaches the older philosophers for the fact that they have not investigated the principle of motion for which men care most. Further, object is altogether absent; there is no determination of activity. Hence Aristotle says in the former passage: "In that they undertake to give the cause of origin and decay, they in fact remove the cause of movement. Because they make the principle to be a simple body (earth being excepted), they do not comprehend the mutual origination and decay whereby the one arises out of the other: I am here referring to water, air, fire, and earth. This origination is to be shown as separation or as union, and hence the contradiction comes about that one in time comes earlier than the other. That is, because this kind of origination is the method which they have adopted, the way taken is from the simple universal, through the particular, to the individual as what comes latest. Water, air, and fire are, however, universal. Fire seems to be most suitable for this element, seeing that it is the most subtle. Thus those who made it to be the principle, most adequately gave expression to this method (*λόγῳ*) of origination; and others thought very similarly. For else why should no one have made the earth an element, in conformity with the popular idea? Hesiod says that it was the original body — so ancient and so common was this idea. But what in Becoming comes later, is the first in nature." However, these philosophers did not understand this so, because they were ruled by the process of Becoming only, without again sublating it, or knowing that first formal universal as such, and manifesting the third, the totality or unity of matter and form, as essence. Here, we see, the Absolute is not yet the self-

determining, the Notion turned back into itself, but only a dead abstraction; the moderns were the first, says Aristotle, (Metaph. I. 6; III. 3) to understand the fundamental principle more in the form of genus.

We are able to follow the three moments in the Ionic philosophy: (α) The original essence is water; (β) Anaximander's infinite is descriptive of movement, simple going out of and coming back into the simple, universal aspects of form — condensation and rarefaction; (γ) the air is compared to the soul. It is now requisite that what is viewed as reality should be brought into the Notion; in so doing we see that the moments of division, condensation, and rarefaction are not in any way antagonistic to the Notion. This transition to Pythagoras, or the manifestation of the real side as the ideal, is Thought breaking free from what is sensuous, and, therefore, it is a separation between the intelligible and the real.

B. Pythagoras and the Pythagoreans.

THE LATER NEO-PYTHAGOREANS have written many extensive biographies of Pythagoras, and are especially diffuse as regards the Pythagorean brotherhood. But it must be taken into consideration that these often distorted statements must not be regarded as historical. The life of Pythagoras thus first comes to us in history through the medium of the ideas belonging to the first centuries after Christ, and more or less in the style in which the life of Christ is written, on the ground of ordinary actuality, and not in a poetic atmosphere; it appears to be the intermingling of many marvellous and extravagant tales, and to take its origin in part from eastern ideas and in part from western. In acknowledging the remarkable nature of his life and genius and of the life which he inculcated on his followers, it was added that his dealings were not with right things, and that he was a magician and one who had intercourse with higher beings. All the ideas of magic, that medley of unnatural and natural, the mysteries which pervade a clouded, miserable imagination, and the wild ideas of distorted brains, have attached themselves to him.

However corrupt the history of his life, his philosophy is as much so. Everything engendered by Christian melancholy and love of allegory has been identified with it. The treatment of Plato in Christian times has quite a different character. Numbers have been much used as the expression of ideas, and this on the one hand has a semblance of profundity. For the fact that another significance than that immediately presented is implied in them, is evident at once; but how much there is within them is neither known by him who speaks nor by him, who seeks to understand; it is like the witches' rhyme (one time one) in Goethe's "Faust." The less clear the

thoughts, the deeper they appear; what is most essential, but most difficult, the expression of oneself in definite conceptions, is omitted. Thus Pythagoras' philosophy, since much has been added to it by those who wrote of it, may similarly appear as the mysterious product of minds as shallow and empty as they are dark. Fortunately, however, we have a special knowledge of the theoretic, speculative side of it, and that, indeed, from Aristotle and Sextus Empiricus, who have taken considerable trouble with it. Although later Pythagoreans disparage Aristotle on account of his exposition, he has a place above any such disparagement, and therefore to them no attention must be given.

In later times a quantity of writings were disseminated and foisted upon Pythagoras. Diogenes Laertius (VIII. 6, 7) mentions many which were by him, and others which were set down to him in order to obtain authority for them. But in the first place we have no writings by Pythagoras, and secondly it is doubtful whether any ever did exist. We have quotations from these in unsatisfactory fragments, not from Pythagoras, but from Pythagoreans. It cannot be decisively determined which developments and interpretations belonged to the ancients and which to the moderns; yet with Pythagoras and the ancient Pythagoreans the determinations were not worked out in so concrete a way as later.

As to the life of Pythagoras, we hear from Diogenes Laertius (VIII. 1-3, 45) that he flourished about the 60th Olympiad (540 B.C.). His birth is usually placed in the 49th or 50th Olympiad (584 B.C.); by Larcher in Tennemann (Vol. I., pp. 413, 414), much earlier — in the 43rd Olympiad (43, 1, i.e. 608 B.C.). He was thus contemporaneous with Thales and Anaximander. If Thales' birth were in the 38th Olympiad and that of Pythagoras in the 43rd, Pythagoras was only twenty-one years younger than he; he either only differed by a couple of years from Anaximander (Ol. 42, 3) in age, or the latter was twenty-six years older. Anaximenes was from

twenty to twenty-five years younger than Pythagoras. His birthplace was the Island of Samos, and hence he belonged to the Greeks of Asia Minor, which place we have hitherto found to be the seat of philosophy. Pythagoras is said by Herodotus (IV., 93 to 96) to have been the son of Mnesarchus, with whom Zalmoxis served as slave in Samos; Zalmoxis obtained freedom and riches, became ruler of the Getæ, and asserted that he and his people would not die. He built a subterranean habitation and there withdrew himself from his subjects; after four years he re-appeared;[31] hence the Getans believed in immortality. Herodotus thinks, however, that Zalmoxis was undoubtedly much older than Pythagoras.

His youth was spent at the court of Polycrates, under whose rule Samos was brought, not only to wealth, but also to the possession of culture and art. In this prosperous period, according to Herodotus (III., 39), it possessed a fleet of a hundred ships. His father was an artist or engraver, but reports vary as to this, as also as to his country, some saying that his family was of Tyrrhenian origin and did not go to Samos till after Pythagoras' birth. That may be as it will, for his youth was spent in Samos and he must hence have been naturalized there, and to it he belongs. He soon journeyed to the main land of Asia Minor and is said there to have become acquainted with Thales. From thence he travelled to Phœnicia and Egypt, as Iamblichus (III., 13, 14) says in his biography of Pythagoras. With both countries Asia Minor had many links, commercial and political, and it is related that he was recommended by Polycrates to King Amasis, who, according to Herodotus (II. 154), attracted many Greeks to the country, and had Greek troops and colonies. The narratives of further journeys into the interior of Asia, to the Persian magicians and Indians, seem to be altogether fabulous, although travelling, then as now, was considered to be a means of culture. As Pythagoras travelled with a scientific purpose, it is said that he had himself initiated into nearly all the mysteries of Greeks and of Barbarians,

and thus he obtained admission into the order or caste of the Egyptian priesthood.

These mysteries that we meet with amongst the Greeks, and which are held to be the sources of much wisdom, appear in their religion to have stood in the relationship of doctrine to worship. This last existed in offerings and solemn festivals only, but to ordinary conceptions, to a consciousness of these conceptions, there is no transition visible unless they were preserved in poems as traditions. The doctrines themselves, or the act of bringing the actual home to the conception, seems to have been confined to the mysteries; we find it to be the case, however, that it is not only the ideas as in our teaching, but also the body that is laid claim to — that there was brought home to man by sending him to wander amongst his fellow-men, both the abandonment of his sensuous consciousness and the purification and sanctification of the body. Of philosophic matter, however, there is as little openly declared as possible, and just as we know the system of freemasonry, there is no secret in those mysteries.

His alliance with the Egyptian priesthood had a most important influence upon Pythagoras, not through the derivation of profound speculative wisdom therefrom, but by the idea obtained through it of the realization of the moral consciousness of man; the individual, he learned, must attend to himself, if inwardly and to the outer world he is to be meritorious and to bring himself, morally formed and fashioned, into actuality. This is a conception which he subsequently carried out, and it is as interesting a matter as his speculative philosophy. Just as the priests constituted a particular rank and were educated for it, they also had a special rule, which was binding throughout the whole moral life. From Egypt Pythagoras thus without doubt brought the idea of his Order, which was a regular community brought together for purposes of scientific and moral culture,

which endured during the whole of life. Egypt at that time was regarded as a highly cultured country, and it was so when compared with Greece; this is shown even in the differences of caste which assumes a division amongst the great branches of life and work, such as the industrial, scientific and religious. But beyond this, we need not seek great scientific knowledge amongst the Egyptians, nor think that Pythagoras got his science there. Aristotle (Metaph. I.) only says that "in Egypt mathematical sciences first commenced, for there the nation of priests had leisure."[32]

Pythagoras stayed a long time in Egypt, and returned from thence to Samos; but he found the internal affairs of his own country in confusion, and left it soon after. According to Herodotus' account (III. 45-47), Polycrates had — not as tyrant — banished many citizens from Samos, who sought and found support amongst the Lacedæmonians, and a civil war had broken out. The Spartans had, at an earlier period, given assistance to the others, for, as Thucydides says (I. 18), to them thanks were generally ascribed for having abolished the rule of the few, and caused a reversion to the system of giving public power to the people; later on they did the opposite, abolishing democracy and introducing aristocracy. Pythagoras' family was necessarily involved in these unpleasant relations, and a condition of internal strife was not congenial to Pythagoras, seeing that he no longer took an interest in political life, and that he saw in it an unsuitable soil for carrying out his plans. He traversed Greece, and betook himself from thence to Italy, in the lower parts of which Greek colonies from various states and for various motives had settled, and there flourished as important trading towns, rich in people and possessions.

In Crotona he settled down, and lived in independence, neither as a statesman, warrior, nor political law-giver to the people, so far as external life was concerned, but as a public teacher, with the provision that his teaching should not be taken up with mere conviction, but should also

regulate the whole moral life of the individual. Diogenes Laertius says that he first gave himself the name *φιλόσοφος*, instead of *σοφός*; and men called this modesty, as if he thereby expressed, not the possession of wisdom, but only the struggle towards it, as towards an end which cannot be attained.[33] But *σοφός* at the same time means a wise man, who is also practical, and that not in his own interest only, for that requires no wisdom, seeing that every sincere and moral man does what is best from his own point of view. Thus *φιλόσοφος* signifies more particularly the opposite to participation in practical matters, that is in public affairs. Philosophy is thus not the love of wisdom, as of something which one sets oneself to acquire; it is no unfulfilled desire. *Φιλόσοφος* means a man whose relation to wisdom is that of making it his object; this relationship is contemplation, and not mere Being; but it must be consciously that men apply themselves to this. The man who likes wine (*φίλοινος*) is certainly to be distinguished from the man who is full of wine, or a drunkard. Then does *φίλοινος* signify only a futile aspiration for wine?

What Pythagoras contrived and effected in Italy is told us by later eulogists, rather than by historians. In the history of Pythagoras by Malchus (this was the Syrian name of Porphyry) many strange things are related, and with the Neo-Platonists the contrast between their deep insight and their belief in the miraculous is surprising. For instance, seeing that the later biographers of Pythagoras had already related a quantity of marvels, they now proceeded to add yet more to these with reference to his appearance in Italy. It appears that they were exerting themselves to place him, as they afterwards did with Apollonius of Tyana, in opposition to Christ. For the wonders which they tell of him seem partly to be an amplification of those in the New Testament, and in part they are altogether absurd. For instance, they make Pythagoras begin his career in Italy with a miracle. When he landed in the Bay of Tarentum, at Crotona, he encountered fishermen on the

way to the town who had caught nothing. He called upon them to draw their nets once more, and foretold the number of fishes that would be found in them. The fishermen, marvelling at this prophecy, promised him that if it came true they would do whatever he desired. It came to pass as he said, and Pythagoras then desired them to throw the fishes alive back into the sea, for the Pythagoreans ate no flesh. And it is further related as a miracle which then took place, that none of the fishes whilst they were out of the water died during the counting. This is the kind of miracle that is recorded, and the stories with which his biographers fill his life are of the same silly nature. They then make him effect such a general impression upon the mind of Italy, that all the towns reformed upon their luxurious and depraved customs, and the tyrants partly gave up their powers voluntarily, and partly they were driven out. They thereby, however, commit such historical errors as to make Charondas and Zaleucus, who lived long before Pythagoras, his disciples; and similarly to ascribe the expulsion and death of the tyrant Phalaris to him, and to his action.[34]

Apart from these fables, there remains as an historic fact, the great work which he accomplished, and this he did chiefly by establishing a school, and by the great influence of his order upon the principal part of the Greco-Italian states, or rather by means of the rule which was exercised in these states through this order, which lasted for a very long period of time. It is related of him that he was a very handsome man, and of a majestic appearance, which captivated as much as it commanded respect. With this natural dignity, nobility of manners, and the calm propriety of his demeanour, he united external peculiarities, through which he seemed a remarkable and mysterious being. He wore a white linen garment, and refrained from partaking of certain foods.[35] Particular personality, as also the externalities of dress and the like, are no longer of importance; men let themselves be guided by general custom and fashion, since it is a matter

outside of and indifferent to them not to have their own will here; for we hand over the contingent to the contingent, and only follow the external rationality that consists in identity and universality. To this outward personality there was added great eloquence and profound perception; not only did he undertake to impart this to his individual friends, but he proceeded to bring a general influence to bear on public culture, both in regard to understanding and to the whole manner of life and morals. He not merely instructed his friends, but associated them in a particular life in order to constitute them into persons and make them skilful in business and eminent in morals. The Institute of Pythagoras grew into a league, which included all men and all life in its embrace; for it was an elaborately fashioned piece of work, and excellently plastic in design.

Of the regulations of Pythagoras' league, we have descriptions from his successors, more especially from the Neo-Platonists, who are particularly diffuse as regards its laws. The league had, on the whole, the character of a voluntary priesthood, or a monastic order of modern times. Whoever wished to be received was proved in respect of his education and obedience, and information was collected about his conduct, inclinations, and occupations. The members were subject to a special training, in which a difference was made amongst those received, in that some were exoteric and some esoteric. These last were initiated into the highest branches of science, and since political operations were not excluded from the order, they were also engaged in active politics; the former had to go through a novitiate of five years. Each member must have surrendered his means to the order, but he received them again on retiring, and in the probationary period silence was enjoined (*ἐχεμυθία*).[36]

This obligation to cease from idle talk may be called an essential condition for all culture and learning; with it men must begin if they wish to comprehend the thoughts of others and relinquish their own ideas. We are in

the habit of saying that the understanding is cultivated through questioning, objecting and replying, &c., but, in fact, it is not thus formed, but made from without. What is inward in man is by culture got at and developed; hence though he remains silent, he is none the poorer in thought or denser of mind. He rather acquires thereby the power of apprehension, and comes to know that his ideas and objections are valueless; and as he learns that such ideas are valueless, he ceases to have them. Now the fact that in Pythagoras there is a separation between those in the course of preparation and those initiated, as also that silence is particularly enjoined, seems most certainly to indicate that in his brotherhood both were formal elements and not merely as present in the nature of things, as might occur spontaneously in the individual without any special law or the application of any particular consideration. But here it is important to remark that Pythagoras may be regarded as the first instructor in Greece who introduced the teachings of science; neither Thales, who was earlier than he, nor his contemporary Anaximander taught scientifically, but only imparted their ideas to their friends. There were, generally speaking, no sciences at that time; there was neither a science of philosophy, mathematics, jurisprudence or anything else, but merely isolated propositions and facts respecting these subjects. What was taught was the use of arms, theorems, music, the singing of Homer's or Hesiod's songs, tripod chants, &c., or other arts. This teaching is accomplished in quite another way. Now if we said that Pythagoras had introduced the teaching of science amongst a people who, though like the Greeks, untaught therein, were not stupid but most lively, cultured and loquacious, the external conditions of such teaching might in so far be given as follows: — (α) He would distinguish amongst those who as yet had no idea of the process of learning a science, so that those who first began should be excluded from that which was to be imparted to those further on; and (β) he would make them leave the unscientific mode of speaking of

such matters, or their idle prattle, alone, and for the first time study science. But the fact that this action both appeared to be formal and likewise required to be made such, was, on account of its unwonted character, a necessary one, just because the followers of Pythagoras were not only numerous, necessitating a definite form and order, but also, generally speaking, they lived continually together. Thus a particular form was natural to Pythagoras, because it was the very first time that a teacher in Greece arrived at a totality, or a new principle, through the cultivation of the intelligence, mind and will. This common life had not only the educational side and that founded on the exercise of physical ingenuity or skill, but included also that of the moral culture of practical men. But even now everything relating to morality appears and is or becomes altogether formal, or rather this is so in as far as it is consciously thought of as in this relation, for to be formal is to be universal, that which is opposed to the individual. It appears so particularly to him who compares the universal and the individual and consciously reflects over both, but this difference disappears for those living therein, to whom it is ordinary habit.

Finally, we have sufficient and full accounts of the outward forms observed by the Pythagoreans in their common life and also of their discipline. For much of this, however, we are indebted to the impressions of later writers. In the league, a life regulated in all respects was advocated. First of all, it is told us, that the members made themselves known by a similar dress — the white linen of Pythagoras. They had a very strict order for each day, of which each hour had its work. The morning, directly after rising, was set aside for recalling to memory the history of the previous day, because what is to be done in the day depends chiefly on the previous day; similarly the most constant self-examination was made the duty of the evening in order to find whether the deeds done in the day were right or wrong. True culture is not the vanity of directing so much attention to

oneself and occupying oneself with oneself as an individual, but the self-oblivion that absorbs oneself in the matter in hand and in the universal; it is this consideration of the thing in hand that is alone essential, while that dangerous, useless, anxious state does away with freedom. They had also to learn by heart from Homer and from Hesiod; and all through the day they occupied themselves much with music — one of the principal parts of Greek education and culture.[37] Gymnastic exercises in wrestling, racing, throwing, and so on, were with them also enforced by rule. They dined together, and here, too, they had peculiar customs, but of these the accounts are different. Honey and bread were made their principal food, and water the principal, and indeed only, drink; they must thus have entirely refrained from eating meat as being associated with metempsychosis. A distinction was also made regarding vegetables — beans, for example, being forbidden. On account of this respect for beans, they were much derided, yet in the subsequent destruction of the political league, several Pythagoreans, being pursued, preferred to die than to damage a field of beans.[38]

The order, the moral discipline which characterized them, the common intercourse of men, did not, however, endure long; for even in Pythagoras' life-time the affairs of his league must have become involved, since he found enemies who forcibly overthrew him. He drew down upon him, it is said, the envy of others, and was accused of thinking differently from what he seemed to indicate, and thus of having an *arrière pensée*. The real fact of the case was that the individual belonged, not entirely to his town, but also to another. In this catastrophe, Pythagoras himself, according to Tennemann (Vol. I. p. 414), met his death in the 69th Olympiad (504, B.C.) in a rising of the people against these aristocrats; but it is uncertain whether it happened in Crotona or in Metapontum, or in a war between the Syracusans and the Agrigentines. There is also much difference of opinion about the

age of Pythagoras, for it is given sometimes as 80, and sometimes as 104.[39] For the rest, the unity of the Pythagorean school, the friendship of the members, and the connecting bond of culture have even in later times remained, but not in the formal character of a league, because what is external must pass away. The history of Magna Græcia is in general little known, but even in Plato's[40] time we find Pythagoreans appearing at the head of states or as a political power.

The Pythagorean brotherhood had no relation with Greek public and religious life, and therefore could not endure for long: in Egypt and in Asia exclusiveness and priestly influence have their home, but Greece, in its freedom, could not let the Eastern separation of caste exist. Freedom here is the principle of civic life, but still it is not yet determined as principle in the relations of public and private law. With us the individual is free since all are alike before the law; diversity in customs, in political relations and opinions may thus exist, and must indeed so do in organic states. In democratic Greece, on the contrary, manners, the external mode of life, necessarily preserved a certain similarity, and the stamp of similarity remained impressed on these wider spheres; for the exceptional condition of the Pythagoreans, who could not take their part as free citizens, but were dependent on the plans and ends of a combination and led an exclusive religious life, there was no place in Greece. The preservation of the mysteries certainly belonged to the Eumolpidæ, and other special forms of worship to other particular families, but they were not regarded in a political sense as of fixed and definite castes, but as priests usually are, politicians, citizens, men like their fellows; nor, as with the Christians, was the separation of religious persons driven to the extreme of monastic rule. In ordinary civic life in Greece, no one could prosper or maintain his position who held peculiar principles, or even secrets, and differed in outward modes of life and clothing; for what evidently united and

distinguished them was their community of principles and life — whether anything was good for the commonwealth or not, was by them publicly and openly discussed. The Greeks are above having particular clothing, maintaining special customs of washing, rising, practising music, and distinguishing between pure and impure foods. This, they say, is partly the affair of the particular individual and of his personal freedom, and has no common end in view, and partly it is a general custom and usage for everybody alike.

What is most important to us is the Pythagorean philosophy — not the philosophy of Pythagoras so much as that of the Pythagoreans, as Aristotle and Sextus express it. The two must certainly be distinguished, and from comparing what is given out as Pythagorean doctrine, many anomalies and discrepancies become evident, as we shall see. Plato bears the blame of having destroyed Pythagorean philosophy through absorbing what is Pythagorean in it into his own. But the Pythagorean philosophy itself developed to a point which left it quite other than what at first it was. We hear of many followers of Pythagoras in history who have arrived at this or that conclusion, such as Alcmæon and Philolaus; and we see in many cases the simple undeveloped form contrasted with the further stages of development in which thought comes forth in definiteness and power. We need, however, go no further into the historical side of the distinction, for we can only consider the Pythagorean philosophy generally; similarly we must separate what is known to belong to the Neo-Platonists and Neo-Pythagoreans, and for this end we have sources to draw from which are earlier than this period, namely the express statements found in Aristotle and Sextus.

The Pythagorean philosophy forms the transition from realistic to intellectual philosophy. The Ionic school said that essence or principle is a definite material. The next conclusion is (α) that the absolute is not grasped

in natural form, but as a thought determination. (*β*) Then it follows that determinations must be posited while the beginning was altogether undetermined. The Pythagorean philosophy has done both.

1. *The System of Numbers*. Thus the original and simple proposition of the Pythagorean philosophy is, according to Aristotle (Metaph. I. 5), "that number is the reality of things, and the constitution of the whole universe in its determinations is an harmonious system of numbers and of their relations." In what sense is this statement to be taken? The fundamental determination of number is its being a measure; if we say that everything is quantitatively or qualitatively determined, the size and measure is only one aspect or characteristic which is present in everything, but the meaning here is that number itself is the essence and the substance of things, and not alone their form. What first strikes us as surprising is the boldness of such language, which at once sets aside everything which to the ordinary idea is real and true, doing away with sensuous existence and making it to be the creation of thought. Existence is expressed as something which is not sensuous, and thus what to the senses and to old ideas is altogether foreign, is raised into and expressed as substance and as true Being. But at the same time the necessity is shown for making number to be likewise Notion, to manifest it as the activity of its unity with Being, for to us number does not seem to be in immediate unity with the Notion.

Now although this principle appears to us to be fanciful and wild, we find in it that number is not merely something sensuous, therefore it brings determination with it, universal distinctions and antitheses. The ancients had a very good knowledge of these. Aristotle (Metaph. I. 6) says of Plato: "He maintained that the mathematical elements in things are found outside of what is merely sensuous, and of ideas, being between both; it differs from what is sensuous in that it is eternal and unchangeable, and from ideas, in that it possesses multiplicity, and hence each can resemble and be similar

to another, while each idea is for itself one alone.” That is, number can be repeated; thus it is not sensuous, and still not yet thought. In the life of Pythagoras, this is further said by Malchus (46, 47): “Pythagoras propounded philosophy in this wise in order to loose thought from its fetters. Without thought nothing true can be discerned or known; thought hears and sees everything in itself, the rest is lame and blind. To obtain his end, Pythagoras makes use of mathematics, since this stands midway between what is sensuous and thought, as a kind of preliminary to what is in and for itself.” Malchus quotes further (48, 53) a passage from an early writer, Moderatus: “Because the Pythagoreans could not clearly express the absolute and the first principles through thought, they made use of numbers, of mathematics, because in this form determinations could be easily expressed.” For instance, similarity could be expressed as one, dissimilarity as two. “This mode of teaching through the use of numbers, whilst it was the first philosophy, is superseded on account of its mysterious nature. Plato, Speusippus, Aristotle, &c., have stolen the fruits of their work from the Pythagoreans by making a simple use of their principle.” In this passage a perfect knowledge of numbers is evident.

The enigmatic character of the determination through number is what most engages our attention. The numbers of arithmetic answers to thought-determinations, for number has the “one” as element and principle; the one, however, is a category of being-for-self, and thus of identity with self, in that it excludes all else and is indifferent to what is “other.” The further determinations of number are only further combinations and repetitions of the one, which all through remains fixed and external; number, thus, is the most utterly dead, notionless continuity possible; it is an entirely external and mechanical process, which is without necessity. Hence number is not immediate Notion, but only a beginning of thought, and a beginning in the

worst possible way; it is the Notion in its extremest externality, in quantitative form, and in that of indifferent distinction. In so far, the one has within itself both the principle of thought and that of materiality, or the determination of the sensuous. In order that anything should have the form of Notion, it must immediately in itself, as determined, relate itself to its opposite, just as positive is related to negative; and in this simple movement of the Notion we find the ideality of differences and negation of independence to be the chief determination. On the other hand, in the number three, for instance, there are always three units, of which each is independent; and this is what constitutes both their defect and their enigmatic character. For since the essence of the Notion is innate, numbers are the most worthless instruments for expressing Notion-determinations.

Now the Pythagoreans did not accept numbers in this indifferent way, but as Notion. "At least they say that phenomena must be composed of simple elements, and it would be contrary to the nature of things if the principle of the universe pertained to sensuous phenomena. The elements and principles are thus not only intangible and invisible, but altogether incorporeal."[41] But how they have come to make numbers the original principle or the absolute Notion, is better shown from what Aristotle says in his Metaphysics (I. 5), although he is shorter than he would have been, because he alleges that elsewhere (infra., p. 214) he has spoken of it. "In numbers they thought that they perceived much greater similitude to what is and what takes place than in fire, water, or earth; since a certain property of numbers (*τοιονδὶ πάθος*) is justice, so is it with (*τοιονδὶ*) the soul and understanding; another property is opportunity, and so on. Since they further saw the conditions and relations of what is harmonious present in numbers, and since numbers are at the basis of all natural things, they considered numbers to be the elements of everything, and the whole heavens to be a harmony and number." In the Pythagoreans we see the

necessity for one enduring universal idea as a thought-determination. Aristotle (Met. XII. 4), speaking of ideas, says: “According to Heraclitus, everything sensuous flows on, and thus there cannot be a science of the sensuous; from this conviction the doctrine of ideas sprang. Socrates is the first to define the universal through inductive methods; the Pythagoreans formerly concerned themselves merely with a few matters of which they derived the notions from numbers — as, for example, with what opportuneness, or right, or marriage are.” It is impossible to discern what interest this in itself can have; the only thing which is necessary for us as regards the Pythagoreans, is to recognize any indications of the Idea, in which there may be a progressive principle.

This is the whole of the Pythagorean philosophy taken generally. We now have to come to closer quarters, and to consider the determinations, or universal significance. In the Pythagorean system numbers seem partly to be themselves allied to categories — that is, to be at once the thought-determinations of unity, of opposition and of the unity of these two moments. In part, the Pythagoreans from the very first gave forth universal ideal determinations of numbers as principles, and recognized, as Aristotle remarks (Metaph. I. 5), as the absolute principles of things, not so much immediate numbers in their arithmetic differences, as the principles of number, *i.e.* their rational differences. The first determination is unity generally, the next duality or opposition. It is most important to trace back the infinitely manifold nature of the forms and determinations of finality to their universal thoughts as the most simple principles of all determination. These are not differences of one thing from another, but universal and essential differences within themselves. Empirical objects distinguish themselves by outward form; this piece of paper can be distinguished from another, shades are different in colour, men are separated by differences of temperament and individuality. But these determinations are not essential

differences; they are certainly essential for the definite particularity of the things, but the whole particularity defined is not an existence which is in and for itself essential, for it is the universal alone which is the self-contained and the substantial. Pythagoras began to seek these first determinations of unity, multiplicity, opposition, &c. With him they are for the most part numbers; but the Pythagoreans did not remain content with this, for they gave them the more concrete determinations, which really belong to their successors. Necessary progression and proof are not to be sought for here; comprehension, the development of duality out of unity are wanting. Universal determinations are only found and established in a quite dogmatic form, and hence the determinations are dry, destitute of process or dialectic, and stationary.

a. The Pythagoreans say that the first simple Notion is unity (*μονάς*); not the discrete, multifarious, arithmetic one, but identity as continuity and positivity, the entirely universal essence. They further say, according to Sextus (adv. Math. X. 260, 261): "All numbers come under the Notion of the one; for duality is one duality and triplicity is equally a 'one,' but the number ten is the one chief number. This moved Pythagoras to assert unity to be the principle of things, because, through partaking of it, each is called one." That is to say, the pure contemplation of the implicit being of a thing is the one, the being like self; to all else it is not implicit, but a relationship to what is other. Things, however, are much more determined than being merely this dry "one." The Pythagoreans have expressed this remarkable relationship of the entirely abstract one to the concrete existence of things through "simulation" (*μίμησις*). The same difficulty which they here encounter is also found in Plato's Ideas; since they stand over against the concrete as species, the relation of concrete to universal is naturally an important point. Aristotle (Metaph. I. 6) ascribes the expression "participation" (*μέθεξις*) to Plato, who took it in place of the Pythagorean

expression "simulation." Simulation is a figurative, childish way of putting the relationship; participation is undoubtedly more definite. But Aristotle says, with justice, that both are insufficient; that Plato has not here arrived at any further development, but has only substituted another name. "To say that ideas are prototypes and that other things participate in them is empty talk and a poetic metaphor; for what is the active principle that looks upon the ideas?" (Metaph. I. 9). Simulation and participation are nothing more than other names for relation; to give names is easy, but it is another thing to comprehend.

b. What comes next is the opposition, the duality (*δυάς*), the distinction, the particular; such determinations have value even now in Philosophy; Pythagoras merely brought them first to consciousness. Now, as this unity relates to multiplicity, or this being-like-self to being another, different applications are possible, and the Pythagoreans have expressed themselves variously as to the forms which this first opposition takes.

(*α*) They said, according to Aristotle (Metaph. I. 5): "The elements of number are the even and the odd; the latter is the finite" (or principle of limitation) "and the former is the infinite; thus the unity proceeds from both and out of this again comes number." The elements of immediate number are not yet themselves numbers: the opposition of these elements first appears in arithmetical form rather than as thought. But the one is as yet no number, because as yet it is not quantity; unity and quantity belong to number. Theon of Smyrna[42] says: "Aristotle gives, in his writings on the Pythagoreans, the reason why, in their view, the one partakes of the nature of even and odd; that is, one, posited as even, makes odd; as odd, it makes even. This is what it could not do unless it partook of both natures, for which reason they also called the one, even-odd" (*ἀρτιοπέριττον*).

(*β*) If we follow the absolute Idea in this first mode, the opposition will also be called the undetermined duality (*ἀόριστος δυάς*). Sextus speaks

more definitely (adv. Math. X. 261, 262) as follows: "Unity, thought of in its identity with itself (*κατ' αὐτότητα ἑαυτῆς*), is unity; if this adds itself to itself as something different (*καθ' ἑτερότητα*), undetermined duality results, because no one of the determined or otherwise limited numbers is this duality, but all are known through their participation in it, as has been said of unity. There are, according to this, two principles in things; the first unity, through participation in which all number-units are units, and also undetermined duality through participation in which all determined dualities are dualities." Duality is just as essential a moment in the Notion as is unity. Comparing them with one another, we may either consider the unity to be form and duality matter, or the other way; and both appear in different modes. (*αα*) Unity, as the being-like-self, is the formless; but in duality, as the unlike, there comes division or form. (*ββ*) If, on the other hand, we take form as the simple activity of absolute form, the one is what determines; and duality as the potentiality of multiplicity, or as multiplicity not posited, is matter. Aristotle (Met. I. 6) says that it is characteristic of Plato that "he makes out of matter many, but with him the form originates only once; whereas out of one matter only one table proceeds, whoever brings form to matter, in spite of its unity, makes many tables." He also ascribes this to Plato, that "instead of showing the undetermined to be simple (*ἀντὶ τοῦ ἀπείρου ὡς ἑνός*), he made of it a duality — the great and small."

(*γ*) Further consideration of this opposition, in which Pythagoreans differ from one another, shows us the imperfect beginning of a table of categories which were then brought forward by them, as later on by Aristotle. Hence the latter was reproached for having borrowed these thought-determinations from them; and it certainly was the case that the Pythagoreans first made the opposite to be an essential moment in the absolute. They further determined the abstract and simple Notions, although it was in an inadequate way, since their table presents a mixture of antitheses in the

ordinary idea and the Notion, without following these up more fully. Aristotle (Met. I. 5) ascribes these determinations either to Pythagoras himself, or else to Alcmæon "who flourished in the time of Pythagoras' old age," so that "either Alcmæon took them from the Pythagoreans or the latter took them from him." Of these antitheses or co-ordinates to which all things are traced, ten are given, for, according to the Pythagoreans, ten is a number of great significance: —

1. The finite and the infinite.
2. The odd and the even.
3. The one and the many.
4. The right and the left.
5. The male and the female.
6. The quiescent and the moving.
7. The straight and the crooked.
8. Light and darkness.
9. Good and evil.
10. The square and the parallelogram.

This is certainly an attempt towards a development of the Idea of speculative philosophy in itself, *i.e.* in Notions; but the attempt does not seem to have gone further than this simple enumeration. It is very important that at first only a collection of general thought-determinations should be made, as was done by Aristotle; but what we here see with the Pythagoreans is only a rude beginning of the further determination of antitheses, without order and sense, and very similar to the Indian enumeration of principles and substances.

(*δ*) We find the further progress of these determinations in Sextus (adv. Math. X. 262-277), when he speaks about an exposition of the later Pythagoreans. It is a very good and well considered account of the

Pythagorean theories, which has some thought in it. The exposition follows these lines: “The fact that these two principles are the principles of the whole, is shown by the Pythagoreans in manifold ways.”

א. “There are three methods of thinking things; firstly, in accordance with diversity, secondly, with opposition, and thirdly, according to relation. (*αα*) What is considered in its mere diversity, is considered for itself; this is the case with those subjects in which each relates only to itself, such as horse, plant, earth, air, water and fire. Such matters are thought of as detached and not in relation to others.” This is the determination of identity with self or of independence. (*ββ*) “In reference to opposition, the one is determined as evidently contrasting with the other; we have examples of this in good and evil, right and wrong, sacred and profane, rest and movement, &c. (*γγ*) According to relation (*πρός τι*), we have the object which is determined in accordance with its relationship to others, such as right and left, over and under, double and half. One is only comprehensible from the other; for I cannot tell which is my left excepting by my right.” Each of these relations in its opposition, is likewise set up for itself in a position of independence. “The difference between relationship and opposition is that in opposition the coming into existence of the ‘one’ is at the expense of the ‘other,’ and conversely. If motion is taken away, rest commences; if motion begins, rest ceases; if health is taken away, sickness begins, and conversely. In a condition of relationship, on the contrary, both take their rise, and both similarly cease together; if the right is removed, so also is the left; the double goes and the half is destroyed.” What is here taken away is taken not only as regards its opposition, but also in its existence. “A second difference is that what is in opposition has no middle; for example, between sickness and health, life and death, rest and motion, there is no third. Relativity, on the contrary, has a middle, for between larger and smaller there is the like; and between too large and too small the right

size is the medium." Pure opposition passes through nullity to opposition; immediate extremes, on the other hand, subsist in a third or middle state, but in such a case no longer as opposed. This exposition shows a certain regard for universal, logical determinations, which now and always have the greatest possible importance, and are moments in all conceptions and in everything that is. The nature of these opposites is, indeed, not considered here, but it is of importance that they should be brought to consciousness.

ב. "Now since these three represent three different genera, the subjects and the two-fold opposite, there must be a higher genus over each of them which takes the first place, since the genus comes before its subordinate kinds. If the universal is taken away, so is the kind; on the other hand, if the kind, not the genus, for the former depends on the latter, but not the contrary way." (*αα*) "The Pythagoreans have declared the one to be the highest genus of what is considered as in and for itself" (of subjects in their diversity); this is, properly speaking, nothing more than translating the determinations of the Notion into numbers. (*ββ*) "What is in opposition has, they say, as its genus the like and the unlike; rest is the like, for it is capable of nothing more and nothing less; but movement is the unlike. Thus what is according to nature is like itself; it is a point which is not capable of being intensified (*ἀνεπίτατος*); what is opposed to it is unlike. Health is like, sickness is unlike. (*γγ*) The genus of that which is in an indifferent relationship is excess and want, the more and the less;" in this we have the quantitative relation just as we formerly had the qualitative.

ג. We now come for the first time to the two opposites: "These three genera of what is for itself, in opposition and in relationship, must now come under" — yet simpler, higher— "genera," *i.e.* thought-determinations. "Similarity reduces itself to the determination of unity." The genus of the subjects is the very being on its own account. "Dissimilarity, however, consists of excess and want, but both of these come under undetermined

duality;" they are the undetermined opposition, opposition generally. "Thus from all these relationships the first unity and the undetermined duality proceed;" the Pythagoreans said that such are found to be the universal modes of things. "From these, there first comes the 'one' of numbers and the 'two' of numbers; from the first unity, the one; from the unity and the undetermined duality the two; for twice the one is two. The other numbers take their origin in a similar way, for the unity over moves forward, and the undetermined duality generates the two." This transition of qualitative into quantitative opposition is not clear. "Hence underlying these principles, unity is the active principle" or form, "but the two is the passive matter; and just as they make numbers arise from them, so do they make the system of the world and that which is contained in it." The nature of these determinations is to be found in transition and in movement. The deeper significance of this reflection rests in the connection of universal thought-determinations with arithmetic numbers — in subordinating these and making the universal genus first.

Before I say anything of the further sequence of these numbers, it must be remarked that they, as we see them represented here, are pure Notions. (α) The absolute, simple essence divides itself into unity and multiplicity, of which the one sublates the other, and at the same time it has its existence in the opposition. (β) The opposition has at the same time subsistence, and in this is found the manifold nature of equivalent things. (γ) The return of absolute essence into itself is the negative unity of the individual subject and of the universal or positive. This is, in fact, the pure speculative Idea of absolute existence; it is this movement: with Plato the Idea is nothing else. The speculative makes its appearance here as speculative; whoever does not know the speculative, does not believe that in indicating simple Notions such as these, absolute essence is expressed. One, many, like, unlike, more or less, are trivial, empty, dry moments; that there should be contained in

them absolute essence, the riches and the organization of the natural, as of the spiritual world, does not seem possible to him who, accustomed to ordinary ideas, has not gone back from sensuous existence into thought. It does not seem to such a one that God is, in a speculative sense, expressed thereby — that what is most sublime can be put in those common words, what is deepest, in what is so well known, self-evident and open, and what is richest, in the poverty of these abstractions.

It is at first in opposition to common reality that this idea of reality as the manifold of simple essence, has in itself its opposition and the subsistence of the same; this essential, simple Notion of reality is elevation into thought, but it is not flight from what is real, but the expression of the real itself in its essence. We here find the Reason which expresses its essence; and absolute reality is unity immediately in itself. Thus it is pre-eminently in relation to this reality that the difficulties of those who do not think speculatively have become so intense. What is its relation to common reality? What has taken place is just what happens with the Platonic Ideas, which approximate very closely to these numbers, or rather to pure Notions. That is to say, the first question is, "Numbers, where are they? Dispersed through space, dwelling in independence in the heaven of ideas? They are not things immediately in themselves, for a thing, a substance, is something quite other than a number: a body bears no similarity to it." To this we may answer that the Pythagoreans did not signify anything like that which we understand by prototypes — as if ideas, as the laws and relations of things, were present in a creative consciousness as thoughts in the divine understanding, separated from things as are the thoughts of an artist from his work. Still less did they mean only subjective thoughts in our consciousness, for we use the absolute antithesis as the explanation of the existence of qualities in things, but what determines is the real substance of what exists, so that each thing is essentially just its having in it unity, duality, as also their antithesis and

connection. Aristotle (Met. I. 5, 6) puts it clearly thus: “It is characteristic of the Pythagoreans that they did not maintain the finite and the infinite and the One, to be, like fire, earth, &c., different natures or to have another reality than things; for the Infinite and the abstract One are to them, the substance of the things of which they are predicated. Hence too, they said, Number is the essence of all things. Thus they do not separate numbers from things, but consider them to be things themselves. Number to them is the principle and matter of things, as also their qualities and forces;” hence it is thought as substance, or the thing as it is in the reality of thought.

These abstract determinations then became more concretely determined, especially by the later philosophers, in their speculations regarding God. We may instance Iamblichus, for example, in the work *θεολογούμενα ἀριθμητικῆς*, ascribed to him by Porphyry and Nicomachus. Those philosophers sought to raise the character of popular religion, for they inserted such thought-determinations as these into religious conceptions. By Monas they understood nothing other than God; they also call it Mind, the Hermaphrodite (which contains both determinations, odd as well as even), and likewise substance, reason, chaos (because it is undetermined), Tartarus, Jupiter, and Form. They called the duad by similar names, such as matter, and then the principle of the unlike, strife, that which begets, Isis, &c.

c. The triad (*τριάς*) has now become a most important number, seeing that in it the monad has reached reality and perfection. The monad proceeds through the duad, and again brought into unity with this undetermined manifold, it is the triad. Unity and multiplicity are present in the triad in the worst possible way — as an external combination; but however abstractly this is understood, the triad is still a profound form. The triad then is held to be the first perfect form in the universal. Aristotle (De Cœlo I. 1) puts this very clearly: “The corporeal has no dimension outside of the Three; hence

the Pythagoreans also say that the all and everything is determined through triplicity," that is, it has absolute form. "For the number of the whole has end, middle, and beginning; and this is the triad." Nevertheless there is something superficial in the wish to bring everything under it, as is done in the systematization of the more modern natural philosophy. "Therefore we, too, taking this determination from nature, make use of it in the worship of the gods, so that we believe them to have been properly apostrophized only when we have called upon them three times in prayer. Two we call both, but not all; we speak first of three as all. What is determined through three is the first totality (*πᾶν*); what is in triple form is perfectly divided. Some is merely in one, other is only in two, but this is All." What is perfect, or has reality, is its identity, opposition and unity, like number generally; but in triplicity this is actual, because it has beginning, middle, and end. Each thing is simple as beginning; it is other or manifold as middle, and its end is the return of its other nature into unity or mind; if we take this triplicity from a thing, we negate it and make of it an abstract construction of thought.

It is now comprehensible that Christians sought and found the Trinity in this threefold nature. It has often been made a superficial reason for objecting to them; sometimes the idea of the Trinity as it was present to the ancients, was considered as above reason, as a secret, and hence, too high; sometimes it was deemed too absurd. But from the one cause or from the other, they did not wish to bring it into closer relation to reason. If there is a meaning in this Trinity, we must try to understand it. It would be an anomalous thing if there were nothing in what has for two thousand years been the holiest Christian idea; if it were too holy to be brought down to the level of reason, or were something now quite obsolete, so that it would be contrary to good taste and sense to try to find a meaning in it. It is the

Notion of the Trinity alone of which we can speak, and not of the idea of Father and Son, for we am not dealing with these natural relationships.

d. The Four (*τετράς*) is the triad but more developed, and hence with the Pythagoreans it held a high position. That the tetrad should be considered to be thus complete, reminds one of the four elements, the physical and the chemical, the four continents, &c. In nature four is found to be present everywhere, and hence this number is even now equally esteemed in natural philosophy. As the square of two, the fourfold is the perfection of the two-fold in as far as it — only having itself as determination, i.e. being multiplied with itself — returns into identity with itself. But in the triad the tetrad is in so far contained, as that the former is the unity, the other-being, and the union of both these moments, and thus, since the difference, as posited, is a double, if we count it, four moments result. To make this clearer, the tetrad is comprehended as the *τετρακτύς*, the efficient, active four (from *τέτταρα* and *ἄγω*); and afterwards this is by the Pythagoreans made the most notable number. In the fragments of a poem of Empedocles, who originally was a Pythagorean, it is shown in what high regard this tetraktus, as represented by Pythagoras, was held:

"If thou dost this,

It will lead thee in the path of holy piety. I swear it
By the one who to our spirit has given the Tetraktus,
Which has in it eternal nature's source and root."[43]

e. From this the Pythagoreans proceed to the ten, another form of this tetrad. As the four is the perfect form of three, this fourfold, thus perfected and developed so that all its moments shall be accepted as real differences, is the number ten (*δεκάς*), the real tetrad. Sextus (adv. Math. IV. 3; VII. 94, 95) says: "Tetraktus means the number which, comprising within itself the four first numbers, forms the most perfect number, that is the number ten;

for one and two and three and four make ten. When we come to ten, we again consider it as a unity and begin once more from the beginning. The tetraktus, it is said, has the source and root of eternal nature within itself, because it is the Logos of the universe, of the spiritual and of the corporeal.” It is an important work of thought to show the moments not merely to be four units, but complete numbers; but the reality in which the determinations are laid hold of, is here, however, only the external and superficial one of number; there is no Notion present although the tetraktus does not mean number so much as idea. One of the later philosophers, Proclus, (in Timæum, p. 269) says, in a Pythagorean hymn: —

“The divine number goes on,”...

“Till from the still unprofaned sanctuary of the Monad
It reaches to the holy Tetrad, which creates the mother of all that is;
Which received all within itself, or formed the ancient bounds of all,
Incapable of turning or of wearying; men call it the holy Dekad.”

What we find about the progression of the other numbers is more indefinite and unsatisfying, and the Notion loses itself in them. Up to five there may certainly be a kind of thought in numbers, but from six onwards they are merely arbitrary determinations.

2. *Application of the System to the Universe*. This simple idea and the simple reality contained therein, must now, however, be further developed in order to come to reality as it is when put together and expanded. The question now meets us as to how, in this relation, the Pythagoreans passed from abstract logical determinations to forms which indicate the concrete use of numbers. In what pertains to space or music, determinations of objects formed by the Pythagoreans through numbers, still bear a somewhat closer relation to the thing, but when they enter the region of the concrete in nature and in mind, numbers become purely formal and empty.

a. To show how the Pythagoreans constructed out of numbers the system of the world, Sextus instances (adv. Math. X. 277-283), space relations, and undoubtedly we have in them to do with such ideal principles, for numbers are, in fact, perfect determinations of abstract space. That is to say, if we begin with the point, the first negation of vacuity, "the point corresponds to unity; it is indivisible and the principle of lines, as the unity is that of numbers. While the point exists as the monad or One, the line expresses the duad or Two, for both become comprehensible through transition; the line is the pure relationship of two points and is without breadth. Surface results from the threefold; but the solid figure or body belongs to the fourfold, and in it there are three dimensions present. Others say that body consists of one point" (*i.e.* its essence is one point), "for the flowing point makes the line, the flowing line, however, makes surface, and this surface makes body. They distinguish themselves from the first mentioned, in that the former make numbers primarily proceed from the monad and the undetermined duad, and then points and lines, plane surfaces and solid figures, from numbers, while they construct all from one point." To the first, distinction is opposition or form set forth as duality; the others have form as activity. "Thus what is corporeal is formed under the directing influence of numbers, but from them also proceed the definite bodies, water, air, fire, and the whole universe generally, which they declare to be harmonious. This harmony is one which again consists of numeral relations only, which constitute the various concords of the absolute harmony."

We must here remark that the progression from the point to actual space also has the signification of occupation of space, for "according to their fundamental tenets and teaching," says Aristotle (Metaph. I. 8), "they speak of sensuously perceptible bodies in nowise differently from those which are mathematical." Since lines and surfaces are only abstract moments in space,

external construction likewise proceeds from here very well. On the other hand, the transition from the occupation of space generally to what is determined, to water, earth, &c., is quite another thing and is more difficult; or rather the Pythagoreans have not taken this step, for the universe itself has, with them, the speculative, simple form, which is found in the fact of being represented as a system of number-relations. But with all this, the physical is not yet determined.

b. Another application or exhibition of the essential nature of the determination of numbers is to be found in the relations of music, and it is more especially in their case that number constitutes the determining factor. The differences here show themselves as various relations of numbers, and this mode of determining what is musical is the only one. The relation borne by tones to one another is founded on quantitative differences whereby harmonies may be formed, in distinction to others by which discords are constituted. The Pythagoreans, according to Porphyry (De vita Pyth. 30), treated music as something soul-instructing and scholastic (Psychagogisches und Pädagogisches). Pythagoras was the first to discern that musical relations, these audible differences, are mathematically determinable, that what we hear as consonance and dissonance is a mathematical arrangement. The subjective, and, in the case of hearing, simple feeling which, however, exists inherently in relation, Pythagoras has justified to the understanding, and he attained his object by means of fixed determinations. For to him the discovery of the fundamental tones of harmony are ascribed, and these rest on the most simple number-relations. Iamblichus (De vita Pyth. XXVI. 115) says that Pythagoras, in passing by the workshop of a smith, observed the strokes that gave forth a particular chord; he then took into consideration the weight of the hammer giving forth a certain harmony, and from that determined mathematically the tone as related thereto.[44] And finally he applied the same, and experimented in

strings, by which means there were three different relations presented to him — Diapason, Diapente, and Diatessaron. It is known that the tone of a string, or, in the wind instrument, of its equivalent, the column of air in a reed, depends on three conditions; on its length, on its thickness, and on the amount of tension. Now if we have two strings of equal thickness and length, a difference in tension brings about a difference in sound. If we want to know what tone any string has, we have only to consider its tension, and this may be measured by the weight depending from the string, by means of which it is extended. Pythagoras here found that if one string were weighted with twelve pounds, and another with six (*λόγος διπλάσιος*, 1 : 2) it would produce the musical chord of the octave (*διὰ πασῶν*); the proportion of 8 : 12, or of 2 : 3 (*λόγος ἡμιόλιος*) would give the chord of the fifth (*διὰ πέντε*); the proportion of 9 : 12, or 3 : 4 (*λόγος ἐπίτριτος*), the fourth (*διὰ τεσσάρων*).[45] A different number of vibrations in like times determines the height and depth of the tone, and this number is likewise proportionate to the weight, if thickness and length are equal. In the first case, the more distended string makes as many vibrations again as the other; in the second case, it makes three vibrations for the other's two, and so it goes on. Here number is the real factor which determines the difference, for tone, as the vibration of a body, is only a quantitatively determined quiver or movement, that is, a determination made through space and time. For there can be no determination for the difference excepting that of number or the amount of vibrations in one time; and hence a determination made through numbers is nowhere more in place than here. There certainly are also qualitative differences, such as those existing between the tones of metals and catgut strings, and between the human voice and wind instruments; but the peculiar musical relation borne by the tone of one instrument to another, in which harmony is to be found, is a relationship of numbers.

From this point the Pythagoreans enter into further applications of the theory of music, in which we cannot follow them. The *à priori* law of progression, and the necessity of movement in number-relations, is a matter which is entirely dark; minds confused may wander about at will, for everywhere ideas are hinted at, and superficial harmonies present themselves and disappear again. But in all that treats of the further construction of the universe as a numerical system, we have the whole extent of the confusion and turbidity of thought belonging to the later Pythagoreans. We cannot say how much pains they took to express philosophic thought in a system of numbers, and also to understand the expressions given utterance to by others, and to put in them all the meaning possible. When they determined the physical and the moral universe by means of numbers, everything came into indefinite and insipid relationships in which the Notion disappeared. In this matter, however, so far as the older Pythagoreans are concerned, we are acquainted with the main principles only. Plato exemplifies to us the conception of the universe as a system of numbers, but Cicero and the ancients always call these numbers the Platonic, and it does not appear that they were ascribed to the Pythagoreans. It was thus later on that this came to be said; even in Cicero's time they had become proverbially dark, and there is but little after all that is really old.

c. The Pythagoreans further constructed the heavenly bodies of the visible universe by means of numbers, and here we see at once the barrenness and abstraction present in the determination of numbers. Aristotle says (Met. I. 5), "Because they defined numbers to be the principles of all nature, they brought under numbers and their relationships all determinations and all sections, both of the heavens and of all nature; and where anything did not altogether conform, they sought to supply the deficiency in order to bring about a harmony. For instance, as the Ten or dekad appeared to them to be the perfect number, or that which embraces

the whole essence of numbers, they said that the spheres moving in the heavens must be ten; but as only nine of these are visible, they made out a tenth, the Antichthone (*ἀντίχθονα*)." These nine are, first the milky way, or the fixed stars, and after that the seven stars which were then all held to be planets: Saturn, Jupiter, Mars, Venus, Mercury, the Sun, Moon, and in the last and ninth place, the Earth. The tenth is thus the Antichthone, and in regard to this it must remain uncertain whether the Pythagoreans considered it to be the side of the Earth which is turned away, or as quite another body.

Aristotle says, in reference to the specially physical character of these spheres (De cœlo II. 13 and 9), "Fire was by the Pythagoreans placed in the middle, but the Earth was made a star that moved around this central body in a circle." This circle is, then, a sphere, which, as the most perfect of figures, corresponds to the dekad. We here find a certain similarity to our ideas of the solar system, but the Pythagoreans did not believe the fire to be the sun. "They thus," says Aristotle, "rely, not on sensuous appearance, but on reasons," just as we form conclusions in accordance with reasons as opposed to sensuous appearances; and indeed this comes to us still as the first example of things being in themselves different from what they appear. "This fire, that which is in the centre, they called Jupiter's place of watch. Now these ten spheres make, like all that is in motion, a tone; but each makes a different one, according to the difference in its size and velocity. This is determined by means of the different distances, which bear an harmonious relationship to one another, in accordance with musical intervals; by this means an harmonious sound arises in the moving spheres" — a universal chorus.

We must acknowledge the grandeur of this idea of determining everything in the system of the heavenly spheres through number-relations which have a necessary connection amongst themselves, and have to be conceived of as thus necessarily related; it is a system of relations which

must also form the basis and essence of what can be heard, or music. We have, comprehended here in thought, a system of the universe; the solar system is alone rational to us, for the other stars are devoid of interest. To say that there is music in the spheres, and that these movements are tones, may seem just as comprehensible to us as to say that the sun is still and the earth moves, although both are opposed to the dictates of sense. For, seeing that we do not see the movement, it may be that we do not hear the notes. And there is little difficulty in imagining a universal silence in these vast spheres, since we do not hear the chorus, but it is more difficult to give a reason for not hearing this music. The Pythagoreans say, according to the last quoted passage of Aristotle, that we do not hear it because we live in it, like the smith who gets accustomed to the blows of his hammer. Since it belongs to our substance and is identical with ourselves, nothing else, such as silence, by which we might know the other, comes into relationship with us, for we are conceived of as entirely within the movement. But the movement does not become a tone, in the first place, because pure space and time, the elements in movement, can only raise themselves into a proper voice, unstimulated from without, in an animate body, and movement first reaches this definite, characteristic individuality in the animal proper; and, in the next place, because the heavenly bodies are not related to one another as bodies whose sound requires for its production, contact, friction, or shock, in response to which, and as the negation of its particularity its own momentary individuality resounds in elasticity; for heavenly bodies are independent of one another, and have only a general, non-individual, free motion.

We may thus set aside sound; the music of the spheres is indeed a wonderful conception, but it is devoid of any real interest for us. If we retain the conception that motion, as measure, is a necessarily connected system of numbers, as the only rational part of the theory, we must maintain

that nothing further has transpired to the present day. In a certain way, indeed, we have made an advance upon Pythagoras. We have learned from Kepler about laws, about eccentricity, and the relation of distances to the times of revolution, but no amount of mathematics has as yet been able to give us the laws of progression in the harmony through which the distances are determined. We know empirical numbers well enough, but everything has the semblance of accident and not of necessity. We are acquainted with an approximate rule of distances, and thus have correctly foretold the existence of planets where Ceres, Vesta, Pallas, &c., were afterwards discovered — that is, between Mars and Jupiter. But astronomy has not as yet found in it a consistent sequence in which there is rationality; on the other hand, it even looks with disdain on the appearance of regularity presented by this sequence, which is, however, on its own account, a most important matter, and one which should not be forgotten.

d. The Pythagoreans also applied their principle to the Soul, and thus determined what is spiritual as number. Aristotle (De anim. I. 2) goes on to tell that they thought that solar corpuscles are soul, others, that it is what moves them; they adopted this idea because the corpuscles are ever moving, even in perfect stillness, and hence they must have motion of their own. This does not signify much, but it is evident from it that the determination of self-movement was sought for in the soul. The Pythagoreans made a further application of number-conceptions to the soul after another form, which Aristotle describes in the same place as follows:— “Thought is the one, knowledge or science is the two, for it comes alone out of the one. The number of the plane is popular idea, opinion; the number of the corporeal is sensuous feeling. Everything is judged of either by thought, or science, or opinion, or feeling.” In these ideas, which we must, however, ascribe to later Pythagoreans, we may undoubtedly find some adequacy, for while thought is pure universality, knowledge deals with something “other,” since

it gives itself a determination and a content; but feeling is the most developed in its determinateness. “Now because the soul moves itself, it is the self-moving number,” yet we never find it said that it is connected with the monad.

This is a simple relationship to number-determinations. Aristotle instances (De anim. I. 3) one more intricate from Timæus: “The soul moves itself, and hence also the body because it is bound up with body; it consists of elements and is divided according to harmonic numbers, and hence it has feeling and an immediately indwelling (*σύμφυτον*) harmony. In order that the whole may have an harmonious movement, Timæus has bent the straight line of harmony (*εὐθυωρίαν*) into a circle, and again divided off from the whole circle two circles, which are doubly connected; and the one of these circles is again divided into seven circles, so that the movements of the soul may resemble those of the heavens.” The more definite significance of these ideas Aristotle unfortunately has not given; they contain a profound knowledge of the harmony of the whole, but yet they are forms which themselves remain dark, because they are clumsy and unsuitable. There is always a forcible turning and twisting, a struggle with the material part of the representation, as there is in mythical and distorted forms: nothing has the pliability of thought but thought itself. It is remarkable that the Pythagoreans have grasped the soul as a system which is a counterpart of the system of the heavens. In Plato’s Timæus this same idea is more definitely brought forward. Plato also gives further number-relations, but not their significance as well; even to the present day no one has been able to make any particular sense out of them. An arrangement of numbers such as this is easy, but to give to it a real significance is difficult, and, when done, it always must be arbitrary.

There is still something worthy of attention in what is said by the Pythagoreans in reference to the soul, and this is their doctrine of the

transmigration of souls. Cicero (Tusc. Quæst. I. 16) says: “Pherecydes, the teacher of Pythagoras, first said that the souls of men were immortal.” The doctrine of the transmigration of souls extends even to India, and, without doubt, Pythagoras took it from the Egyptians; indeed Herodotus (II. 123) expressly says so. After he speaks of the mythical ideas of the Egyptians as to the lower world, he continues: “The Egyptians were the first to say that the soul of man is immortal, and that, when the body disappears, it goes into another living being; and when it has gone through all the animals of land and sea, and likewise birds, it again takes the body of a man, the period being completed in 3000 years.” Diogenes Laertius says in this connection (VIII. 14) that the soul, according to Pythagoras, goes through a circle. “These ideas,” proceeds Herodotus, “are also found amongst the Greeks; there are some who, earlier or later, have made use of this particular doctrine, and have spoken of it as if it were their own; I know their names very well, but I will not mention them.” He undoubtedly meant Pythagoras and his followers. In the sequel, much that is given utterance to is fictitious: “Pythagoras himself is said to have stated that his former personality was known to him. Hermes granted him a knowledge of his circumstances before his birth. He lived as the son of Hermes, Æthalides, and then in the Trojan war as Euphorbus, the son of Panthous, who killed Patroclus, and was killed by Menelaus; in the third place he was Hermotimus; fourthly, Pyrrhus, a fisherman of Delos; in all he lived 207 years. Euphorbus’ shield was offered up to Apollo by Menelaus, and Pythagoras went to the temple and, from the mouldering shield, showed the existence of signs, hitherto not known of, by which it was recognized.”[46] We shall not treat further of these very various and foolish stories.

As in the case of the brotherhood copied from the Egyptian priesthood, so must we here set aside this oriental and un-Greek idea of the transmigration of souls. Both were too far removed from the Greek spirit to

have had a place and a development there. With the Greeks, the consciousness of a higher, freer individuality has become too strong to allow any permanence to the idea of metempsychosis, according to which, man, this independent and self-sufficing Being, takes the form of a beast. They have, indeed, the conception of men as becoming springs of water, trees, animals, &c., but the idea of degradation which comes as a consequence of sin, lies at its root. Aristotle (De anim. I. 3) shortly and in his own manner deals with and annihilates this idea of the Pythagoreans. "They do not say for what reason soul dwells in body, nor how the latter is related to it. For owing to their unity of nature when one acts the other suffers: one moves and the other is moved, but none of this happens in what is mutually contingent. According to the Pythagorean myths any soul takes to any body, which is much like making architects take to flutes. For crafts must necessarily have tools and soul body; but each tool must have its proper form and kind." It is implied in the transmigration of souls that the organization of the body is something accidental to the human soul; this refutation by Aristotle is complete. The eternal idea of metempsychosis had philosophic interest only as the inner Notion permeating all these forms, the oriental unity which appears in everything; we have not got this signification here, or at best we have but a glimmering of it. If we say that the particular soul is, as a definite thing, to wander about throughout all, we find firstly, that the soul is not a thing such as Leibnitz' Monad, which, like a bubble in the cup of coffee, is possibly a sentient, thinking soul; in the second place an empty identity of the soul-thing such as this has no interest in relation to immortality.

3. *Practical Philosophy*. As regards the practical philosophy of Pythagoras, which is closely connected with what has gone before, there is but little that is philosophic known to us. Aristotle (Magn. Moral. I. 1) says of him that "he first sought to speak of virtue, but not in the right way, for,

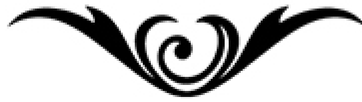
because he deduced the virtues from numbers, he could not form of them any proper theory.” The Pythagoreans adopted ten virtues as well as ten heavenly spheres. Justice, amongst others, is described as the number which is like itself in like manner (*ἴσακις ἴσος*); it is an even number, which remains even when multiplied with itself. Justice is pre-eminently what remains like itself; but this is an altogether abstract determination, which applies to much that is, and which does not exhaust the concrete, thus remaining quite indeterminate.

Under the name of the “Golden words,” we have a collection of hexameters which are a succession of moral reflections, but which are rightly ascribed to later Pythagoreans. They are old, well-known, moral maxims, which are expressed in a simple and dignified way, but which do not contain anything remarkable. They begin with the direction “to honour the immortal gods as they are by law established,” and further, “Honour the oath and then the illustrious heroes;” elsewhere they go on to direct “honour to be paid to parents and to relatives,” &c.[47] Such matter does not deserve to be regarded as philosophy, although it is of importance in the process of development.

The transition from the form of outward morals to morality as existent, is more important. As in Thales’ time, law-givers and administrators of states were preeminent in possessing a physical philosophy, so we see that with Pythagoras practical philosophy is advocated as the means of constituting a moral life. There we have the speculative Idea, the absolute essence, in its reality, and in a definite, sensuous existence; and similarly the moral life is submerged in actuality as the universal spirit of a people, and as their laws and rule. In Pythagoras, on the contrary, we have the reality of absolute essence raised, in speculation, out of sensuous reality, and expressed, though still imperfectly, as the essence of thought. Morality is likewise partly raised out of actuality as ordinarily known; it is certainly a moral

disposition of all actuality, but as a brotherhood, and not as the life of a people. The Pythagorean League is an arbitrary existence and not a part of the constitution recognized by public sanction; and in his person Pythagoras isolated himself as teacher, as he also did his followers. The universal consciousness, the spirit of a people, is the substance of which the accident is the individual consciousness; the speculative is thus the fact that pure, universal law is absolute, individual consciousness, so that this last, because it draws therefrom its growth and nourishment, becomes universal self-consciousness. These two sides do not, however, come to us in the form of the opposition; it is first of all in morality that there is properly this Notion of the absolute individuality of consciousness which does everything on its own account. But we see that it was really present to the mind of Pythagoras that the substance of morality is the universal, from an example in Diogenes Laertius (VIII. 16). "A Pythagorean answered to the question of a father who inquired as to the best education he could give his son, that it should be that which would make him the citizen of a well-regulated State." This answer is great and true; to the great principle of living in the spirit of one's people, all other circumstances are subordinate. Nowadays men try to keep education free from the spirit of the times, but they cannot withdraw themselves from this supreme power, the State, for even if they try to separate themselves, they unconsciously remain beneath this universal. The speculative meaning of the practical philosophy of Pythagoras thus is, that in this signification, the individual consciousness shall obtain a moral reality in the brotherhood. But as number is a middle thing between the sensuous and Notion, the Pythagorean brotherhood is a middle between universal, actual morality and maintaining that in true morality the individual, as an individual, is responsible for his own behaviour; this morality ceases to be universal spirit. If we wish to see

practical philosophy reappear, we shall find it; but, on the whole, we shall not see it become really speculative until very recent times.



We may satisfy ourselves with this as giving us an idea of the Pythagorean system. I will, however, shortly give the principal points of the criticism which Aristotle (Met. I. 8) makes upon the Pythagorean number-form. He says justly, in the first place: "If only the limited and the unlimited, the even and odd are made fundamental ideas, the Pythagoreans do not explain how movement arises, and how, without movement and change there can be coming into being and passing away, or the conditions and activities of heavenly objects." This defect is significant; arithmetical numbers are dry forms and barren principles in which life and movement are deficient. Aristotle says secondly, "From number no other corporeal determinations, such as weight and lightness, are conceivable;" or number thus cannot pass into what is concrete. "They say that there is no number outside of those in the heavenly spheres." For instance, a heavenly sphere and a virtue, or a natural manifestation in the earth, are determined as one and the same number. Each of the first numbers may be exhibited in each thing or quality; but in so far as number is made to express a further determination, this quite abstract, quantitative difference becomes altogether formal; it is as if the plant were five because it has five stamens. This is just as superficial as are determination through elements or through particular portions of the globe; it is a method as formal as that by which men now try to apply the categories of electricity, magnetism, galvanism, compression and expansion, of manly and of womanly, to everything. It is a purely empty system of determination where reality should be dealt with.

To Pythagoras and his disciples there are, moreover, many scientific conclusions and discoveries ascribed, which, however, do not concern us at all. Thus, according to Diogenes Laertius (VIII. 14, 27), he is said to have known that the morning and evening star is the same, and that the moon

derives her light from the sun. We have already mentioned what he says of music. But what is best known is the Pythagorean Theorem; it really is the main proposition in geometry, and cannot be regarded like any other theorem. According to Diogenes, (VIII. 12), Pythagoras, on discovering the theorem, sacrificed a hecatomb, so important did he think it; and it may indeed seem remarkable that his joy should have gone so far as to ordain a great feast to which rich men and all the people were invited. It was worth the trouble; it was a rejoicing, a feast of spiritual cognition — at the cost of the oxen.

Other ideas which are brought forward by the Pythagoreans casually and without any connection, have no philosophic interest, and need only be mentioned. Aristotle, for instance, says (Phys. IV. 6) that "the Pythagoreans believed in an empty space which the heavens inspire, and an empty space which separates natural things and brings about the distinction between continuous and discrete; it first exists in numbers and makes them to be different." Diogenes Laertius (VIII. 26-28) says much more, all of which is dull; this is like the later writers, who, generally speaking, take up what is external and devoid of any intellectual meaning. "The air which encircles the earth is immovable" (*ἄσειστον*, at least through itself) "and diseased, and all that is in it is mortal; but what is highest is in continual movement, pure and healthy, and in it everything is immortal — divine. Sun, moon and the other stars are gods, for in them warmth has predominance and is the cause of life. Man is related to the gods because he participates in warmth, and hence God cares for us. A ray penetrates from the sun through the thick and cold ether and gives life to everything; they call air, cold ether, the sea and moisture, thick ether. The soul is a detached portion of ether."

C. The Eleatic School.

THE PYTHAGOREAN PHILOSOPHY has not yet got the speculative form of expression for the Notion. Numbers are not pure Notion, but Notion in the form of ordinary idea or sensuous perception, and hence a mixture of both. This expression of absolute essence in what is a pure Notion or something thought, and the movement of the Notion or of Thought, is that which we find must come next, and this we discover in the Eleatic school. In it we see thought becoming free for itself; and in that which the Eleatics express as absolute essence, we see Thought grasp itself in purity, and the movement of Thought in Notions. In the physical philosophy we saw movement represented as an objective movement, as an origination and passing away. The Pythagoreans similarly did not reflect upon these Notions, and also treated their essence, Number, as fleeting. But since alteration is now grasped in its highest abstraction as Nothing, this objective movement changes into a subjective one, comes over to the side of consciousness, and existence becomes the unmoved. We here find the beginning of dialectic, *i.e.* simply the pure movement of thought in Notions; likewise we see the opposition of thought to outward appearance or sensuous Being, or of that which is implicit to the being-for-another of this implicitness, and in the objective existence we see the contradiction which it has in itself, or dialectic proper. When we reflect in anticipation on how the course of pure thought must be formed, we find (α) that pure thought (pure Being, the One) manifests itself immediately in its rigid isolation and self-identity, and everything else as null; (β) that the hitherto timid thought — which after it is strengthened, ascribes value to the "other" and constitutes itself therefrom — shows that it then grasps the other in its simplicity and even in so doing

shows its nullity; (γ) finally, Thought manifests the other in the manifold nature of its determinations. We shall see this in the development and culture of the Eleatics in history. These Eleatic propositions still have interest for Philosophy, and are moments which must necessarily there appear.

Xenophanes, Parmenides, Melissus and Zeno are to be reckoned as belonging to this school. Xenophanes may be regarded as the founder of it; Parmenides is supposed to have been his pupil, and Melissus, and especially Zeno, are called the pupils of Parmenides. In fact, they are to be taken together as forming the Eleatic school; later on it lost the name, being then called Sophistic, and its locality was transferred to Greece proper. What Xenophanes began, Parmenides and Melissus developed further, and similarly Zeno perfected what these two taught. Aristotle (Metaph. I. 5) characterizes the first three thus: "Parmenides seems to comprehend the one as Notion (*κατὰ τὸν λόγον*), Melissus as matter (*κατὰ τὴν ὕλην*); hence the former says that it is limited (*πεπερασμένον*) and the latter that it is unlimited (*ἄπειρον*). But Xenophanes, who was the first of them to express the theory of the One, made the matter no plainer (*διεσαφήνισεν*), nor did he deal with either of these aspects (*φύσεως*), but looking into the heavens" — as we say, into the blue— "said, God is the One. Xenophanes and Melissus are on the whole less civilized (*μικρὸν ἀγροικότεροι*); Parmenides, however, is more acute (*μᾶλλον βλέπων*)." There is less to say of Xenophanes and Melissus, and what has come to us from the latter in particular — in fragments and derived from the sayings of others — is still in a state of ferment, and in his case there is least knowledge obtainable. On the whole, philosophic utterances and Notions are still poor, and it was in Zeno that Philosophy first attained to a purer expression of itself.

1. Xenophanes.

The period at which he lived is clear enough, and as this suffices, it is a matter of indifference that the year of his birth and of his death is unknown. According to Diogenes Laertius (IX. 18), he was contemporary with Anaximander and Pythagoras. Of his circumstances further than this, it is only known that he, for reasons which are unknown, escaped from his native town, Colophon, in Asia Minor, to Magna Græcia, and resided for the most part at Zancle, (now Messina) and Catana (still called Catania) in Sicily. I find it nowhere said by the ancients that he lived at Elea, although all recent writers on the history of Philosophy repeat it, one after the other. Tennemann, in particular, says (Vol. I. pp. 151 and 414), that about the 61st Olympiad (536 B.C.), he repaired from Colophon to Elea. Diogenes Laertius (IX. 20), however, only says that he flourished about the 60th Olympiad and that he made two thousand verses on the colonization of Elea, from which it might be easily concluded that he was also born at Elea. Strabo says this in the beginning of his sixth book — when describing Elea — of Parmenides and Zeno only, and these he called Pythagoreans; hence, according to Cicero (Acad. Quæst. IV. 42) the Eleatic school took its name from these two. Xenophanes was nearly a hundred years old, and lived to see the Median wars: it is said that he became so poor that he had not the means of having his children buried, and was obliged to do so with his own hands. Some say that he had no teacher; others name Archelaus, which is a chronological error.

He wrote a book "On Nature," the general subject and title of Philosophy at that time; some verses have been preserved to us which so far show no powers of reasoning. Professor Brandis of Bonn collected them together, with the fragments of Parmenides and Melissus, under the title "Commentationum Eleaticarum, P. 1," Altonæ, 1813. The older philosophers wrote in verse, for prose comes much later on; on account of

the awkward and confused mode of expression in Xenophanes' poems, Cicero calls them (Acad. Quæst. IV. 23): *minus boni versus*.

As to his philosophy, Xenophanes in the first place maintained absolute existence to be the one, and likewise called this God. "The all is One and God is implanted in all things; He is unchangeable, without beginning, middle or end."[48] In some verses by Xenophanes found in Clemens of Alexandria (Strom. V. 14, p. 714, ed. Potter), it is said:

"One God is greatest amongst gods and men.
Neither like unto mortals in spirit or in form;"

and in Sextus Empiricus (adv. Math. IX. 144):

"He sees everywhere, thinks everywhere, and hears everywhere,"

to which words Diogenes Laertius (IX, 19) adds: "Thought and reason are everything and eternal." By this Xenophanes denied the truth of the conceptions of origination and of passing away, of change, movement, &c., seeing that they merely belong to sensuous perception. "He found," says Tennemann (Vol. I. p. 156) "all origination to be inconceivable:" the One as the immediate product of pure thought, is, in its immediacy, Being.

For us the determination of Being is already known and trivial, but if we know about Being, the One, we place this, as a particular determination, in a line with all the rest. Here, on the contrary, it signifies that all else has no reality and is only a semblance. We must forget our own ideas; we know of God as Spirit. But, because the Greeks only had before them the sensuous world, these gods of their imagination, and found in them no satisfaction, they rejected all as being untrue, and thus came to pure thought. This is a wonderful advance, and thought thus becomes for the first time free for itself in the Eleatic school. Being, the One of the Eleatic school, is just this immersion in the abyss of the abstract identity of the understanding. Just as this comes first, so it also comes last, as that to which the understanding

comes back, and this is proved in recent times when God is grasped only as the highest Being. If we say of God that this the highest Being is outside of and over us, we can know nothing more of it but that it is, and thus it is the undetermined; for if we knew of determinations, this would be to possess knowledge. The truth then simply is that God is the One, not in the sense that there is one God (this is another determination), but only that He is identical with Himself; in this there is no other determination, any more than in the utterance of the Eleatic school. Modern thought has, indeed, passed through a longer path, not only through what is sensuous, but also through philosophic ideas and predicates of God, to this all negating abstraction; but the content, the result arrived at is the same.

With this the dialectic reasoning of the Eleatics is closely connected in respect that they have also proved that nothing can originate or pass away. This deduction is to be found in Aristotle's work, De Xenophane, Zenone et Gorgia, c. 3. "It is impossible, he says,[49] that if anything is, it arises (and he even applies this to the Godhead); for it must arise either from the like or from the unlike. But both are equally impossible: for it is no more probable that the like should be engendered from the like, than that it should engender it, for the like must have determinations identical with one another." In acknowledging similarity, the distinction between begetting and begotten falls away. "Just as little can unlike arise from unlike, for if from the weaker the stronger takes its rise; or from the smaller, the greater; or from the worse, the better: or if, conversely, the worse proceeds from the better, non-being would result from Being: this is impossible, and thus God is eternal." The same thing has been expressed as Pantheism or Spinozaism, which rests on the proposition *ex nihilo fit nihil*. The unity of God is further proved by Xenophanes: "If God is the mightiest, He must be One; for were He two or more, He would not have dominion over the others, but, not

having dominion over the others, He could not be God. Thus were there several, they would be relatively more powerful or weaker, and thus they would not be gods, for God's nature is to have nothing mightier than He. Were they equal, God would no longer possess the quality of being the mightiest, for the like is neither worse nor better than the like" — or it does not differ therefrom. "Hence if God is, and is such as this, He is only one; He could not, were there several, do what He willed. Since He is one, He is everywhere alike. He hears, sees and has also the other senses everywhere, for were this not the case, the parts of God would be one more powerful than the other, which is impossible. Since God is everywhere alike, He has a spherical form, for He is not here thus and elsewhere different, but is everywhere the same. Since He is eternal and one and spherical in form, He is neither unlimited nor limited. To be unlimited is non-being; for that has neither middle, beginning, end, nor part; and what is unlimited corresponds to this description. But whatever non-being is, Being is not. Mutual limitation would take place if there were several, but since there is only One, it is not limited. The one does not move itself, nor is it unmoved; to be unmoved is non-being, for to it none other comes, nor does it go into another; but to be moved must mean to be several, for one must move into another. Thus the One neither rests nor is it moved, for it is neither non-being nor is it many. In all this God is thus indicated; He is eternal and One, like Himself and spherical, neither unlimited nor limited, neither at rest nor moved." From this result, that nothing can arise from the like or from the unlike, Aristotle (De Xenophane, Zenone et Gorgia c. 4) draws this conclusion: "that either there is nothing excepting God, or all else is eternal."

We here see a dialectic which may be called metaphysical reasoning, in which the principle of identity is fundamental. "The nothing is like nothing and does not pass into Being or conversely; thus nothing can originate from

like.” This, the oldest mode of argument, holds its place even to the present day, as, for example, in the so-called proof of the unity of God. This proceeding consists of making presuppositions such as the power of God, and from them drawing conclusions and denying the existence of predicates; that is the usual course in our mode of reasoning. In respect of determinations, it must be remarked that they, as being negative, are all kept apart from the positive and merely real being. We reach this abstraction by a more ordinary way, and do not require a dialectic such as that of the Eleatic school: we say God is unchangeable, change concerns finite things alone (which we represent as an empirical proposition); on the one hand we thus have finite things and change, and on the other, unchangeableness in this abstract absolute unity with itself. It is the same separation, only that we also allow the finite to be Being, which the Eleatics deny. Or else we too proceed from finite things to kinds and genera, leaving the negative out bit by bit; and the highest order of all is God, who, as the highest Being, is affirmative only, but devoid of any determination. Or we pass from what is finite to the infinite, for we say that the finite as limited must have its basis in the infinite. In all these different forms which are quite familiar to us, there is the same difficult question which exists in reference to the Eleatic thought. Whence comes determination and how is it to be grasped — how is it in the one, leaving the finite aside, and also how does the infinite pass out into the finite? The Eleatics in their reflections were distinguished from this our ordinary reflecting thought, in that they went speculatively to work (the speculative element being that change does not exist at all) and that they thus showed that, as Being was presupposed, change in itself is contradictory and inconceivable. For from the one, from Being, the determination of the negative, of the manifold, is withdrawn. Thus while we, in our conception, allow the actuality of the finite world, the Eleatics are more consistent, in that they proceeded to say that only the One exists

and that the negative does not exist at all; — a consequence which, if it necessarily arouses in us surprise, still none the less remains a great abstraction.

Sceptics saw in this the point of view of the uncertainty of all things, and Sextus several times[50] quotes verses such as these: —

“No man at any time knew clearly and truly; nor will he ever know
What of the gods I say, as also of the universe.
For what he thinks to speak most perfectly
He knows that not at all; his own opinions cleave to all.”

Sextus, generalizing, explains this in the first passage thus: “Let us imagine that in a house in which are many valuables, there were those who sought for gold by night; in such a case everyone would think that he had found the gold, but would not know certainly whether he actually had found it. Thus philosophers come into this world as into a great house to seek the truth, but were they to reach it, they could not tell whether they really had attained to it.” The indefinite expressions of Xenophanes might also merely mean that none knows that which he (Xenophanes) here makes known. In the second passage Sextus puts it thus: “Xenophanes does not make all knowledge void, but only the scientific and infallible; opinionative knowledge is, however, left. He expresses this in saying that opinion cleaves to all. So that with him the criterion is made to be opinion, i.e. the apparent, and not that which is firm and sure; Parmenides, on the contrary, condemns opinion.” But from his doctrine of the One, there follows the annihilation of ordinary ideas, which is what he did in the foregoing dialectic; it is evident, however, that nobody could know the truth which he hereby utters. If a thought such as this passed through one’s head, one could not tell that it was true, and in such a case it would only be an opinion.

We here find in Xenophanes a double consciousness; a pure consciousness and consciousness of Being, and a consciousness of opinion. The former was to him the consciousness of the divine, and it is the pure dialectic, which is negatively related to all that is determined and which annuls it. The manner in which he expresses himself towards the sensuous world and finite thought-determinations is seen most clearly in his allusions to the Greek mythological conceptions of the gods. He says, amongst other things, according to Brandis (Comment. Eleat. P. I. p. 68): —

"Did beasts and lions only have hands,
Works of art thereby to bring forth, as do men,
They would, in creating divine forms, give to them
What in image and size belongs to themselves."

He also animadverts on the ideas of the gods held by Homer and Hesiod in verses which Sextus (adv. Math. IX. 193) has preserved to us: —

"Hesiod and Homer have attached to the gods
All that which brings shame and censure to men;
Stealing, adultery, and mutual deceit."

As, on the one hand, he defined absolute Being to be simple, making that which is, however, break through and be immediately present in it, on the other hand he philosophizes on appearances; in reference to this certain fragments only are transmitted to us, and such physical opinions as these can have no great interest. They are meant to have no speculative significance any more than are those of our own physicists. When he says in this connection

"Out of the earth comes all, and returns to it again,
We all have come from earth and water alike,

Thus all that grows and takes its rise is only earth and water,"[51]

this does not signify existence, physical principles, as did the water of Thales. For Aristotle expressly says, that no one regarded the earth as the absolute principle.

2. Parminides.

Parmenides is a striking figure in the Eleatic school, and he arrives at more definite conceptions than does Xenophanes. He was, according to Diogenes (IX. 21), born at Elea of a rich and honourable race. Of his life, however, little is known; Aristotle only says (Met. I. 5) from tradition that he was a scholar of Xenophanes. Sextus Empiricus (adv. Math. VII. 111) calls him a friend (*γνώριμος*) of Xenophanes. Diogenes Laertius further states: "He heard Anaximander and Xenophanes also, but did not follow the latter" (which seems only to refer to his place of abode), "but he lived with Aminias and Diochartes the Pythagorean, attached himself to the latter, and by the former, and not by Xenophanes, was prevailed upon to lead a quiet life." That the period in which his life falls comes between Xenophanes and Zeno — so that he is contemporaneous with them, though younger than the former and older than the latter — is ascertained. According to Diogenes (IX. 23) he flourished about the 69th Olympiad (504-501 B.C.). What is most important is his journey to Athens with Zeno, where Plato makes them talk with Socrates. This may be accepted generally, but what is strictly historical in it cannot be ascertained. In the Thætetus Plato makes Socrates reply to the invitation to examine the Eleatic system: "For Melissus and the others who assert the All to be One at rest, I have a certain respect; I have even more for Parmenides. For, to speak in Homeric language, he seems to me both venerable and strong. I knew him when he was an old man and I

was still quite young, and I heard wonderful things from him."[52] And in the Platonic Dialogue Parmenides (p. 127. Steph. p. 4. Bekk.) where, as is well known, the conversation is carried on by Parmenides and Socrates, the historic circumstances of this interview are related in detail. "Parmenides was very old, had hair which was quite grey, was beautiful in countenance, about sixty-five years old, and Zeno almost forty." Tennemann (Vol. I. p. 415) places the journey in the 80th Olympiad (460-457 B.C.). Thus Socrates, since he was born in Olympiad 77, 4 (469 B.C.), would seem to have been still too young to have carried on a dialogue such as Plato describes, and the principal matter of this dialogue, which is written in the spirit of the Eleatic school, belongs to Plato himself. Besides, we know from Parmenides' life, that he stood in high respect with his fellow-citizens at Elea, whose prosperity must be chiefly ascribed to the laws which Parmenides gave them.[53] We also find in the *πίναξ* of Cebes (towards the beginning) "a Parmenidian life" used synonymously with a moral life.

It must be remarked that here, where the Eleatic school is definitely treated of, Plato does not speak of Xenophanes at all, but only of Melissus and Parmenides. The fact that Plato, in one of his dialogues, likewise accords the chief part to Parmenides, and puts in his mouth the most lofty dialectic that ever was given, does not concern us here. If with Xenophanes, by the proposition that out of nothing nothing comes, origination and what depends upon or can be traced back to it is denied, the opposition between Being and non-being makes its appearance still more clearly with Parmenides, though still unconsciously. Sextus Empiricus and Simplicius have preserved to us the most important fragments from the poems of Parmenides; for Parmenides also propounded his philosophy as a poem. The first long fragment in Sextus (adv. Math. VII. 111) is an allegorical preface to his poem on Nature. This preface is majestic; it is written after the manner of the times, and in it all there is an energetic, impetuous soul

which strives with Being to grasp and to express it. We can show Parmenides' philosophy best in his own words. The introduction runs thus: —

"Horses that bore me, impelled by their courage,
Brought me to the much-famed streets of the goddess
Who leads the wise man to every kind of knowledge.
Maidens point out the way.
The axle sings hot as the daughters of Helios quickly approach,
Leaving the dwelling of night, pressing on to the light,
With mighty hands raising the sheltering veil."

The maidens are, according to Sextus (adv. Math. VII. 112, 113), the senses, and Helios' daughters are more especially the eyes: —

"These are the gates of the pathways of night and of day.
Now the heavenly maidens approach the great doors,
Whose lock double-turned the punishing Dice protects.
To this one soft words were by the maidens addressed
Subtly persuading her the barriers of oak from the gates,
Now to withdraw. Yet these,
Directly the yawning breadth of the doors was revealed,
Drove the horses and waggon, on through the gate.
The goddess received me in friendship, seized with her one hand my right,
And turning towards me, she said:
'Oh, thou, who with guides all immortal and horses,
Camest here in my palace, — be welcome, young man.
For no evil fate has led thee into this path,
(Indeed it lies far from the ways of a man)
But Themis and Dice. Now shalt thou all things explore,

The heart never-flinching of the truth that persuades,
The transient opinions which are not to be trusted.
But from such paths keep the inquiring soul far away.
On this way let not the much followed custom
Cause thee to take the rash eye as thy guide,
Or the confused sounding ear and the tongue. Ponder considerately
With thy reason alone, the doctrine much and often examined,
Which I will proclaim. For there lacks but desire on your way.'"

The goddess develops everything from the double knowledge (α) of thought, of the truth, and (β) of opinion; these make up the two parts of the poem. In another fragment taken from Simplicius' Commentary on Aristotle's Physics (p. 25; 19 a) and from Proclus on the Timæus (p. 29 b), we have the principal part of what is here related preserved to us. "Understand," says the goddess, "which are the two roads of knowledge. The one which is only Being, and which is not non-being, is the path of conviction, the truth is in it. The other that is not Being, and which is necessarily non-being, is, I must tell you, a path quite devoid of reason, for thou canst neither know, or attain to, or express, non-being." The nothing, in fact, turns into something, since it is thought or is said: we say something, think something, if we wish to think and say the nothing. "It is necessary that saying and thinking should be Being; for Being is, but nothing is not at all." There the matter is stated in brief; and in this nothing, falls negation generally, or in more concrete form, limitation, the finite, restriction: *determinatio est negatio* is Spinoza's great saying. Parmenides says, whatever form the negation may take, it does not exist at all. To consider the nothing as the true is "the way of error in which the ignorant and double-minded mortals wander. Perplexity of mind sways the erring sense. Those who believe Being and non-being to be the same, and then again not the same, are like deaf and blind men surprised, like hordes

confusedly driven.” The error is to confuse them and to ascribe the same value to each, or to distinguish them as if non-being were the limited generally. “Whichever way is taken, it leads back to the point from which it started.” It is a constantly self-contradictory and disintegrating movement. To human ideas, now this is held to be reality and now its opposite, and then again a mixture of both.

Simplicius quotes further, in writing on Aristotle’s Physics (p. 17 a; 31, 19): “But the truth is only the ‘is’; this is neither begotten of anything else, nor transient, entire, alone in its class (*μουνογενές*), unmoved and without end; it neither was, nor will be, but is at once the all. For what birth wouldst thou seek for it? How and whence should it be augmented? That it should be from that which is not, I shall allow thee neither to say nor to think, for neither can it be said or thought that the ‘is’ is not. What necessity had either later or earlier made it begin from the nothing? Thus must it throughout only be or not be; nor will any force of conviction ever make something else arise out of that which is not. Thus origination has disappeared, and decease is incredible. Being is not separable, for it is entirely like itself; it is nowhere more, else would it not hold together, nor is it less, for everything is full of Being. The all is one coherent whole, for Being flows into unison with Being: it is unchangeable and rests securely in itself; the force of necessity holds it within the bounds of limitation. It cannot hence be said that it is imperfect; for it is without defect, while non-existence is wanting in all.” This Being is not the undetermined (*ἄπειρον*) for it is kept within the limits of necessity; we similarly find in Aristotle that limitation is ascribed to Parmenides. The sense in which the expression “limit” is to be taken is uncertain. According to Parmenides, however, this absolute limitation is as *Δίκη*, absolute necessity clearly determined in itself; and it is an important fact that he went beyond the uncultured conception of the infinite. “Thought, and that on account of which thought

is, are the same. For not without that which is, in which it expresses itself (*ἐν ᾧ πεφατισμένον ἐστίν*), wilt thou find Thought, seeing that it is nothing and will be nothing outside of that which is." That is the main point. Thought produces itself, and what is produced is a Thought. Thought is thus identical with Being, for there is nothing beside Being, this great affirmation. Plotinus, in quoting (V. Ennead. I. 8) this last fragment says: "Parmenides adopted this point of view, inasmuch as he did not place Being in sensuous things; identifying Being with Thought, he maintained it to be unchangeable." The Sophists concluded from this: "All is truth; there is no error, for error is the non-existent, that which is not to be thought."

Since in this an advance into the region of the ideal is observable, Parmenides began Philosophy proper. A man now constitutes himself free from all ideas and opinions, denies their truth, and says necessity alone, Being, is the truth. This beginning is certainly still dim and indefinite, and we cannot say much of what it involves; but to take up this position certainly is to develop Philosophy proper, which has not hitherto existed. The dialectic that the transient has no truth, is implied in it, for if these determinations are taken as they are usually understood, contradictions ensue. In Simplicius (in Arist. Phys. p. 27 b.; 31 b.) we have further metaphorical images from Parmenides. "Since the utmost limit of Being is perfect, it resembles on every side the form of a well rounded sphere, which from its centre extends in all directions equally, for it can be neither larger or smaller in one part or another. There is no non-being which prevents it from attaining to the like" — from coming into unity with itself— "and there is no Being where it was devoid of Being, here more and there less. Because the all is without defect, it is in all places in the same way like itself in its determinations." Plotinus in the passage quoted says: "He compares Being with the spherical form, because it comprehends all in itself, and Thought is not outside of this, but is contained in it." And

Simplicius says: "We must not wonder at him, for on account of the poetic form, he adopts a mythological fiction (*πλάσματος*)." It immediately strikes us that the sphere is limited, and furthermore in space, and hence another must be above it; but then the Notion of the sphere is the similarity of withholding the different, notwithstanding that even the undifferentiated must be expressed; hence this image is inconsistent.

Parmenides adds to this doctrine of the truth, the doctrine of human opinions, the illusive system of the world. Simplicius, writing on Aristotle's Physics (p. 7 b; 39 a), tells us that he says: "Men have two forms of opinion, one of which should not be, and in it they are mistaken; they set them in opposition to one another in form and symbol. The one, the ethereal fire of the flame, is quite fine, identical with itself throughout, but not identical with the other, for that is also for itself; on the other hand there is what belongs to night, or thick and ponderous existence." By the former, warmth, softness, lightness is expressed, and by the latter, cold. "But since everything is called light and night, and their qualities are suited both to the one kind of things and the other, everything alike is filled with light and dark night; both are alike since nothing exists without both." Aristotle (Met. I. 3 and 5), and the other historians, likewise unanimously attribute to Parmenides the fact that he sets forth two principles for the system of manifest things, warmth and cold, through the union of which everything is. Light, fire, is the active and animate; night, cold, is called the passive.

Parmenides also speaks like a Pythagorean — he was called *ἀνὲρ Πυθαγορεῖος* by Strabo — in the following, and likewise mythological conception: "There are circlets wound round one another, one of which is of the rare element and the other of the dense, between which others are to be found, composed of light and darkness mingled. Those which are less are of impure fire, but those over them of night, through which proceed the forces of the flames. That which holds this all together, however, is something

fixed, like a wall, under which there is a fiery wreath, and the most central of the rare spheres again is fiery. The most central of those mixed is the goddess that reigns over all, the Divider (*κληροῦχος*), Dice and Necessity. For she is the principle of all earthly produce and intermingling, which impels the male to mix with the female, and conversely; she took Love to help her, creating him first amongst the gods. The air is an exhalation (*ἀναπνοή*) of the earth; the sun and the milky way, the breath of fire; and the moon is air and fire mingled, &c."[54]

It still remains to us to explain the manner in which Parmenides regarded sensation and thought, which may undoubtedly at first sight seem to be materialistic. Theophrastus,[55] for example, remarks in this regard: "Parmenides said nothing more than that there are two elements. Knowledge is determined according to the preponderance of the one or of the other; for, according as warmth or cold predominate, thought varies; it becomes better and purer through warmth, and yet it requires also a certain balance."

"For as in each man there still is in his dispersive limbs an intermingling,
So is the understanding of man; for that
Which is thought by men, is the nature of the limbs,
Both in one and all; for thought is indeed the most."[56]

He thus takes sensation and thought to be the same, and makes remembrance and oblivion to arise from these through mingling them, but whether in the intermingling they take an equal place, whether this is thought or not, and what condition this is, he leaves quite undetermined. But that he ascribes sensation to the opposites in and for themselves is clear, because he says: "The dead do not feel light or warmth or hear voices, because the fire is out of them; they feel cold, stillness and the opposite, however, and, speaking generally, each existence has a certain knowledge."

In fact, this view of Parmenides is really the opposite of materialism, for materialism consists in putting together the soul from parts, or independent forces (the wooden horse of the senses).

3. Melissus.

There is little to tell about the life of Melissus. Diogenes Laertius (IX. 24) calls him a disciple of Parmenides, but the discipleship is uncertain; it is also said of him that he associated with Heraclitus. He was born in Samos, like Pythagoras, and was besides a distinguished statesman amongst his people. It is said by Plutarch (in Pericle, 26) that, as admiral of the Samians, he gained in battle a victory over the Athenians. He flourished about the 84th Olympiad (444 B.C.).

In regard to his philosophy, too, there is little to say. Aristotle, where he mentions him, places him always with Parmenides, as resembling him in mode of thought. Simplicius, writing on Aristotle's Physics (p. 7 sqq.), has preserved several fragments of his prose writings on Nature, which show the same kind of thoughts and arguments as we find in Parmenides, but, in part, somewhat more developed. It was a question whether the reasoning in which it is shown that change does not exist, or contradicts itself, which, by Aristotle in his incomplete, and, in some parts, most corrupt work on Xenophanes, Zeno, and Gorgias (c. 2.), was ascribed to Xenophanes, did not really belong to Melissus.[57]

Since the beginning, in which we are told whose reasoning it is, is wanting, conjecture only applies it to Xenophanes. The writing begins with the words "He says," without any name being given. It thus depends on the superscription alone whether Aristotle speaks of the philosophy of Xenophanes or not, and it must be noticed that different hands have put different superscriptions. Indeed, there is in this work (c. 2) an opinion of

Xenophanes mentioned in such a way that it appears as though had what was previously quoted by Aristotle been by him ascribed to Xenophanes, the expression would have been different. It is possible that Zeno is meant, as the internal evidence abundantly shows. There is in it a dialectic more developed in form, more real reflexion, than from the verses could be expected, not from Xenophanes alone, but even from Parmenides. For Aristotle expressly says that Xenophanes does not yet determine with precision; thus the cultured reasoning contained in Aristotle must certainly be denied to Xenophanes; at least, it is so far certain that Xenophanes himself did not know how to express his thoughts in a manner so orderly and precise as that found here. We find it said: —

"If anything is, it is eternal (*ἀΐδιον*)." Eternity is an awkward word, for it immediately makes us think of time and mingle past and future as an infinite length of time; but what is meant is that *ἀΐδιον* is the self-identical, supersensuous, unchangeable, pure present, which is without any time-conception. It is, origination and change are shut out; if it commences, it does so out of nothing or out of Being. "It is impossible that anything should arise from the nothing. If everything could have arisen, or could it merely not have been everything eternally, it would equally have arisen out of nothing. For, if everything had arisen, nothing would once have existed. If some were alone the existent out of which the rest sprang, the one would be more and greater. But the more and greater would thus have arisen out of the nothing of itself, for in the less there is not its more, nor in the smaller its greater."

Simplicius makes this note to the Physics of Aristotle (p. 22 b): "No more can anything arise out of the existent, for the existent already is, and thus does not first arise from the existent."

"As eternal, the existent also is unlimited, since it has no beginning from which it came, nor end in which it ceases. The infinite all is one, for, if there

were two or more, they would limit one another," and thus have a beginning and end. The one would be the nothing of the other and come forth from this nothing. "This one is like itself; for if it were unlike it would no longer be the one that was posited, but many. This one is likewise immovable, inasmuch as it does not move itself, since it does not pass out into anything. In passing out, it would require to do so into what is full or what is empty; it could not be into the full, for that is an impossibility, and just as little could it be into what is empty, for that is the nothing. The one, therefore, is in this way devoid of pain or suffering, not changing in position or form, or mingling with what is different. For all these determinations involve the origination of non-being and passing away of Being, which is impossible." Thus here again the contradiction which takes place when origination and passing away are spoken of, is revealed.

Now Melissus places opinion in opposition to this truth. The change and multiplicity extinguished in Being appears on the other side, in consciousness, as in what is opinionative; it is necessary to say this if only the negative side, the removal of these moments, the Absolute as destitute of predicate, is laid hold of. "In sensuous perception the opposite is present for us; that is to say, a number of things, their change, their origination and passing away, and their intermingling. Thus that first knowledge must take its place beside this second, which has as much certainty for ordinary consciousness as the first." Melissus does not seem to have decided for the one or the other, but, oscillating between both, to have limited the knowledge of the truth to the statement that, speaking generally, between two opposite modes of presentation, the more probable opinion is to be preferred, but that what is so preferred is only to be regarded as the stronger opinion, and not as truth. This is what Aristotle says of him.

Since Aristotle, in distinguishing his philosophy from the philosophy of Parmenides, maintains that in the first place Parmenides seems to

understand the One as the principle of thought, and Melissus as matter, we must remark that this distinction falls away in pure existence, Being, or the One. Pure matter, as also pure thought (if I am to speak of such a distinction), are not present to Parmenides and Melissus, since they are abrogated; and it must only be in the manner of his expression that one of them — according to Aristotle (Phys. I. 2), on account of his clumsier mode of treatment (*μᾶλλον φορτικός*) — could seem to have conceived of the other sense. If the difference consisted secondly in the fact that Parmenides regarded the one as limited and Melissus as unlimited, this limitation of the one would, in effect, immediately contradict the philosophy of Parmenides; for since limit is the non-being of Being, non-being would thus be posited. But when Parmenides speaks of limit, we see that his poetic language is not altogether exact; limit, however, as pure limit, is just simple Being and absolute negativity, in which all else said and set forth is sublated. Necessity, as this pure negativity and movement within itself, although impassive thought, is absolutely bound to its opposite. In the third place it may be said that Parmenides set forth a concomitant philosophy of opinion or reality, to which Being as existence for thought was thus more opposed than was the case with Melissus.

4. Zeno.

What specially characterizes Zeno is the dialectic which, properly speaking, begins with him; he is the master of the Eleatic school in whom its pure thought arrives at the movement of the Notion in itself and becomes the pure soul of science. That is to say, in the Eleatics hitherto considered, we only have the proposition: “The nothing has no reality and is not at all, and thus what is called origin and decease disappears.” With Zeno, on the contrary, we certainly see just such an assertion of the one and removal of

what contradicts it, but we also see that this assertion is not made the starting point; for reason begins by calmly demonstrating in that which is established as existent, its negation. Parmenides asserts that "The all is immutable, for, in change, the non-being of that which is would be asserted, but Being only is; in saying that non-being is, the subject and the predicate contradict themselves." Zeno, on the other hand, says: "Assert your change; in it as change there is the negation to it, or it is nothing." To the former change existed as motion, definite and complete. Zeno protested against motion as such, or pure motion. "Pure Being is not motion; it is rather the negation of motion." We find it specially interesting that there is in Zeno the higher consciousness, the consciousness that when one determination is denied, this negation is itself again a determination, and then in the absolute negation not one determination, but both the opposites must be negated. Zeno anticipated this, and because he foresaw that Being is the opposite of nothing, he denied of the One what must be said of the nothing. But the same thing must occur with all the rest. We find this higher dialectic in Plato's Parmenides; here it only breaks forth in respect to some determinations, and not to the determination of the One and of Being. The higher consciousness is the consciousness of the nullity of Being as of what is determined as against the nothing, partly found in Heraclitus and then in the Sophists; with them it never has any truth, it has no existence in itself, but is only the for-another, or the assurance of the individual consciousness, and assurance as refutation, i.e. the negative side of dialectic.

According to Diogenes Laertius, (IX. 25) Zeno was likewise an Eleat; he is the youngest, and lived most in company with Parmenides. The latter became very fond of him and adopted him as a son; his own father was called Telentagoras. Not in his State alone was his conduct held in high respect, for his fame was universal, and he was esteemed particularly as a teacher. Plato mentions that men came to him from Athens and other places,

in order to profit from his learning.[58] Proud self-sufficiency is ascribed to him by Diogenes (IX. 28) because he — with the exception of a journey made to Athens — continued to reside in Elea, and did not stay a longer time in the great, mighty Athens, and there attain to fame. In very various narratives his death was made for ever celebrated for the strength of his mind evinced in it; it was said that he freed a State (whether his own home at Elea or in Sicily, is not known) from its Tyrant (the name is given differently, but an exact historical account has not been recorded) in the following way, and by the sacrifice of his life. He entered into a plot to overthrow the Tyrant, but this was betrayed. When the Tyrant now, in face of the people, caused him to be tortured in every possible way to get from him an avowal of his confederates, and when he questioned him about the enemies of the State, Zeno first named to the Tyrant all his friends as participators in the plot, and then spoke of the Tyrant himself as the pest of the State. The powerful remonstrances or the horrible tortures and death of Zeno aroused the citizens, inspired them with courage to fall upon the Tyrant, kill him, and liberate themselves. The manner of the end, and his violent and furious state of mind, is very variously depicted. He is said to have pretended to wish to say something into the Tyrant's ear, and then to have bitten his ear, and thus held him fast until he was slain by the others. Others say that he seized him by the nose between his teeth; others that as on his reply great tortures were applied, he bit off his tongue and spat it into the Tyrant's face, to show him that he could get nothing from him, and that he then was pounded in a mortar.[59]

It has just been noticed that Zeno had the very important character of being the originator of the true objective dialectic. Xenophanes, Parmenides, and Melissus, start with the proposition: "Nothing is nothing; the nothing does not exist at all, or the like is real existence," that is, they make one of the opposed predicates to be existence. Now when they

encounter the opposite in a determination, they demolish this determination, but it is only demolished through another, through my assertion, through the distinction that I form, by which one side is made to be the true, and the other the null. We have proceeded from a definite proposition; the nullity of the opposite does not appear in itself; it is not that it abrogates itself, i.e. that it contains a contradiction in itself. For instance, I assert of something that it is the null; then I show this by hypothesis in motion, and it follows that it is the null. But another consciousness does not assert this; I declare one thing to be directly true; another has the right of asserting something else as directly true, that is to say, motion. Similarly what seems to be the case when one philosophic system contradicts another, is that the first is pre-established, and that men starting from this point of view, combat the other. The matter is thus easily settled by saying: “The other has no truth, because it does not agree with me,” and the other has the right to say the same. It does not help if I prove my system or my proposition and then conclude that thus the opposite is false; to this other proposition the first always seems to be foreign and external. Falsity must not be demonstrated through another, and as untrue because the opposite is true, but in itself; we find this rational perception in Zeno.

In Plato’s Parmenides (pp. 127, 128, Steph., pp. 6, 7, Bekk.) this dialectic is very well described, for Plato makes Socrates say of it: “Zeno in his writings asserts fundamentally the same as does Parmenides, that All is One, but he would feign delude us into believing that he was telling something new. Parmenides thus shows in his poems that All is One; Zeno, on the contrary, shows that the Many cannot be.” Zeno replies, that “He wrote thus really against those who try to make Parmenides’ position ridiculous, for they try to show what absurdities and self-contradictions can be derived from his statements; he thus combats those who deduce Being from the many, in order to show that far more absurdities arise from this

than from the statements of Parmenides." That is the special aim of objective dialectic, in which we no longer maintain simple thought for itself, but see the battle fought with new vigour within the enemy's camp. Dialectic has in Zeno this negative side, but it has also to be considered from its positive side.

According to the ordinary ideas of science, where propositions result from proof, proof is the movement of intelligence, a connection brought about by mediation. Dialectic is either (α) external dialectic, in which this movement is different from the comprehension of the movement, or (β) not a movement of our intelligence only, but what proceeds from the nature of the thing itself, i.e. from the pure Notion of the content. The former is a manner of regarding objects in such a way that reasons are revealed and new light thrown, by means of which all that was supposed to be firmly fixed, is made to totter; there may be reasons which are altogether external too, and we shall speak further of this dialectic when dealing with the Sophists. The other dialectic, however, is the immanent contemplation of the object; it is taken for itself, without previous hypothesis, idea or obligation, not under any outward conditions, laws or causes; we have to put ourselves right into the thing, to consider the object in itself, and to take it in the determinations which it has. In regarding it thus, it shows from itself that it contains opposed determinations, and thus breaks up; this dialectic we more especially find in the ancients. The subjective dialectic, which reasons from external grounds, is moderate, for it grants that: "In the right there is what is not right, and in the false the true." True dialectic leaves nothing whatever to its object, as if the latter were deficient on one side only; for it disintegrates itself in the entirety of its nature. The result of this dialectic is null, the negative; the affirmative in it does not yet appear. This true dialectic may be associated with the work of the Eleatics. But in their case the real meaning and quality of philosophic understanding was

not great, for they got no further than the fact that through contradiction the object is a nothing.

Zeno's dialectic of matter has not been refuted to the present day; even now we have not got beyond it, and the matter is left in uncertainty. Simplicius, writing on the Physics of Aristotle (p. 30), says: "Zeno proves that if the many is, it must be great and small; if great, the many must be infinite in number" (it must have gone beyond the manifold, as indifferent limit, into the infinite; but what is infinite is no longer large and no longer many, for it is the negation of the many). "If small, it must be so small as to have no size," like atoms. "Here he shows that what has neither size, thickness nor mass, cannot be. For if it were added to another, it would not cause its increase; were it, that is to say, to have no size and be added thereto, it could not supplement the size of the other and consequently that which is added is nothing. Similarly were it taken away, the other would not be made less, and thus it is nothing. If what has being is, each existence necessarily has size and thickness, is outside of one another, and one is separate from the other; the same applies to all else (*περὶ τοῦ προὔχοντος*), for it, too, has size, and in it there is what mutually differs (*προέξει αὐτοῦ τι*). But it is the same thing to say something once and to say it over and over again; in it nothing can be a last, nor will there not be another to the other. Thus if many are, they are small and great; small, so that they have no size; great, so that they are infinite."

Aristotle (Phys. VI. 9) explains this dialectic further; Zeno's treatment of motion was above all objectively dialectical. But the particulars which we find in the Parmenides of Plato are not his. For Zeno's consciousness we see simple unmoved thought disappear, but become thinking movement; in that he combats sensuous movement, he concedes it. The reason that dialectic first fell on movement is that the dialectic is itself this movement, or movement itself the dialectic of all that is. The thing, as self-moving, has its

dialectic in itself, and movement is the becoming another, self-abrogation. If Aristotle says that Zeno denied movement because it contains an inner contradiction, it is not to be understood to mean that movement did not exist at all. The point is not that there is movement and that this phenomenon exists; the fact that there is movement is as sensuously certain as that there are elephants; it is not in this sense that Zeno meant to deny movement. The point in question concerns its truth. Movement, however, is held to be untrue, because the conception of it involves a contradiction; by that he meant to say that no true Being can be predicated of it.

Zeno's utterances are to be looked at from this point of view, not as being directed against the reality of motion, as would at first appear, but as pointing out how movement must necessarily be determined, and showing the course which must be taken. Zeno now brings forward four different arguments against motion; the proofs rest on the infinite divisibility of space and time.

(a) This is his first form of argument:— "Movement has no truth, because what is in motion must first reach the middle of the space before arriving at the end." Aristotle expresses this thus shortly, because he had earlier treated of and worked out the subject at length. This is to be taken as indicating generally that the continuity of space is presupposed. What moves itself must reach a certain end, this way is a whole. In order to traverse the whole, what is in motion must first pass over the half, and now the end of this half is considered as being the end; but this half of space is again a whole, that which also has a half, and the half of this half must first have been reached, and so on into infinity. Zeno here arrives at the infinite divisibility of space; because space and time are absolutely continuous, there is no point at which the division can stop. Every dimension (and every time and space always have a dimension) is again divisible into two halves,

which must be measured off; and however small a space we have, the same conditions reappear. Movement would be the act of passing through these infinite moments, and would therefore never end; thus what is in motion cannot reach its end. It is known how Diogenes of Sinope, the Cynic, quite simply refuted these arguments against movement; without speaking he rose and walked about, contradicting them by action.[60] But when reasons are disputed, the only valid refutation is one derived from reasons; men have not merely to satisfy themselves by sensuous assurance, but also to understand. To refute objections is to prove their non-existence, as when they are made to fall away and can hence be adduced no longer; but it is necessary to think of motion as Zeno thought of it, and yet to carry this theory of motion further still.

We have here the spurious infinite or pure appearance, whose simple principle Philosophy demonstrates as universal Notion, for the first time making its appearance as developed in its contradiction; in the history of Philosophy a consciousness of this contradiction is also attained. Movement, this pure phenomenon, appears as something thought and shown forth in its real being — that is, in its distinction of pure self-identity and pure negativity, the point as distinguished from continuity. To us there is no contradiction in the idea that the here of space and the now of time are considered as a continuity and length; but their Notion is self-contradictory. Self-identity or continuity is absolute cohesion, the destruction of all difference, of all negation, of being for self; the point, on the contrary, is pure being-for-self, absolute self-distinction and the destruction of all identity and all connection with what is different. Both of these, however, are, in space and time, placed in one; space and time are thus the contradiction; it is necessary, first of all, to show the contradiction in movement, for in movement that which is opposed is, to ordinary conceptions, inevitably manifested. Movement is just the reality of time and

space, and because this appears and is made manifest, the apparent contradiction is demonstrated, and it is this contradiction that Zeno notices. The limitation of bisection which is involved in the continuity of space, is not absolute limitation, for that which is limited is again continuity; however, this continuity is again not absolute, for the opposite has to be exhibited in it, the limitation of bisection; but the limitation of continuity is still not thereby established, the half is still continuous, and so on into infinity. In that we say "into infinity," we place before ourselves a beyond, outside of the ordinary conception, which cannot reach so far. It is certainly an endless going forth, but in the Notion it is present, it is a progression from one opposed determination to others, from continuity to negativity, from negativity to continuity; but both of these are before us. Of these moments one in the process may be called the true one; Zeno first asserts continuous progression in such a way that no limited space can be arrived at as ultimate, or Zeno upholds progression in this limitation.

The general explanation which Aristotle gives to this contradiction, is that space and time are not infinitely divided, but are only divisible. But it now appears that, because they are divisible — that is, in potentiality — they must actually be infinitely divided, for else they could not be divided into infinity. That is the general answer of the ordinary man in endeavouring to refute the explanation of Aristotle. Bayle (Tom. IV. art. Zénon, not. E.) hence says of Aristotle's answer that it is "pitoyable: C'est se moquer du monde que de se servir de cette doctrine; car si la matière est divisible à l'infini, elle contient un nombre infini de parties. Ce n'est donc point un infini en puissance, c'est un infini, qui existe réellement, actuellement. Mais quand-même on accorderait cet infini en puissance, qui deviendrait un infini par la division actuelle de ses parties, on ne perdrait pas ses avantages; car le mouvement est une chose, qui a la même vertu, que la division. Il touche une partie de l'espace sans toucher l'autre, et il les

touche toutes les unes après les autres. N'est-ce pas les distinguer actuellement? N'est-ce pas faire ce que ferait un géomètre sur une table en tirant des lignes, qui désignassent tous les demi-pouces? Il ne brise pas la table en demi-pouces, mais il y fait néanmoins une division, qui marque la distinction actuelle des parties; et je ne crois pas qu'Aristote eut voulu nier, que *si* l'on tirait une infinité de lignes sur un pouce de matière, on n'y introduisît une division, qui réduirait en infini actuel ce qui n'était selon lui qu'un infini virtual." This *si* is good! Divisibility is, as potentiality, the universal; there is continuity as well as negativity or the point posited in it — but posited as moment, and not as existent in and for itself. I can divide matter into infinitude, but I only can do so; I do not really divide it into infinitude. This is the infinite, that no one of its moments has reality. It never does happen that, in itself, one or other — that absolute limitation or absolute continuity — actually comes into existence in such a way that the other moment disappears. There are two absolute opposites, but they are moments, i.e. in the simple Notion or in the universal, in thought, if you will; for in thought, in ordinary conception, what is set forth both is and is not at the same time. What is represented either as such, or as an image of the conception, is not a thing; it has no Being, and yet it is not nothing.

Space and time furthermore, as *quantum*, form a limited extension, and thus can be measured off; just as I do not actually divide space, neither does the body which is in motion. The partition of space as divided, is not absolute discontinuity (Punktualität), nor is pure continuity the undivided and indivisible; likewise time is not pure negativity or discontinuity, but also continuity. Both are manifested in motion, in which the Notions have their reality for ordinary conception — pure negativity as time, continuity as space. Motion itself is just this actual unity in the opposition, and the sequence of both moments in this unity. To comprehend motion is to express its essence in the form of Notion, *i.e.*, as unity of negativity and

continuity; but in them neither continuity nor discreteness can be exhibited as the true existence. If we represent space or time to ourselves as infinitely divided, we have an infinitude of points, but continuity is present therein as a space which comprehends them: as Notion, however, continuity is the fact that all these are alike, and thus in reality they do not appear one out of the other like points. But both these moments make their appearance as existent; if they are manifested indifferently, their Notion is no longer posited, but their existence. In them as existent, negativity is a limited size, and they exist as limited space and time; actual motion is progression through a limited space and a limited time and not through infinite space and infinite time.

That what is in motion must reach the half is the assertion of continuity, i.e. the possibility of division as mere possibility; it is thus always possible in every space, however small. It is said that it is plain that the half must be reached, but in so saying, everything is allowed, including the fact that it never will be reached; for to say so in one case, is the same as saying it an infinite number of times. We mean, on the contrary, that in a larger space the half can be allowed, but we conceive that we must somewhere attain to a space so small that no halving is possible, or an indivisible, non-continuous space which is no space. This, however, is false, for continuity is a necessary determination; there is undoubtedly a smallest in space, i.e. a negation of continuity, but the negation is something quite abstract. Abstract adherence to the subdivision indicated, that is, to continuous bisection into infinitude, is likewise false, for in the conception of a half, the interruption of continuity is involved. We must say that there is no half of space, for space is continuous; a piece of wood may be broken into two halves, but not space, and space only exists in movement. It might equally be said that space consists of an endless number of points, i.e. of infinitely many limits and thus cannot be traversed. Men think themselves able to go from one

indivisible point to another, but they do not thereby get any further, for of these there is an unlimited number. Continuity is split up into its opposite, a number which is indefinite; that is to say, if continuity is not admitted, there is no motion. It is false to assert that it is possible when one is reached, or that which is not continuous; for motion is connection. Thus when it was said that continuity is the presupposed possibility of infinite division, continuity is only the hypothesis; but what is exhibited in this continuity is the being of infinitely many, abstractly absolute limits.

(b) The second proof, which is also the presupposition of continuity and the manifestation of division, is called "Achilles, the Swift." The ancients loved to clothe difficulties in sensuous representations. Of two bodies moving in one direction, one of which is in front and the other following at a fixed distance and moving quicker than the first, we know that the second will overtake the first. But Zeno says, "The slower can never be overtaken by the quicker." And he proves it thus: "The second one requires a certain space of time to reach the place from which the one pursued started at the beginning of the given period." Thus during the time in which the second reached the point where the first was, the latter went over a new space which the second has again to pass through in a part of this period; and in this way it goes into infinity.

c d e f g

B A

B, for instance, traverses two miles (c d) in an hour, A in the same time, one mile (d e); if they are two miles (c d) removed from one another, B has in one hour come to where A was at the beginning of the hour. While B, in the next half hour, goes over the distance crossed by A of one mile (d e), A has got half a mile (e f) further, and so on into infinity. Quicker motion does not help the second body at all in passing over the interval of space by

which he is behind: the time which he requires, the slower body always has at its avail in order to accomplish some, although an ever shorter advance; and this, because of the continual division, never quite disappears.

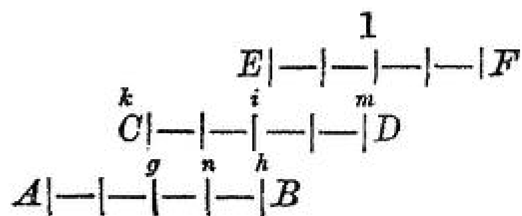
Aristotle, in speaking of this, puts it shortly thus. “This proof asserts the same endless divisibility, but it is untrue, for the quick will overtake the slow body if the limits to be traversed be granted to it.” This answer is correct and contains all that can be said; that is, there are in this representation two periods of time and two distances, which are separated from one another, i.e. they are limited in relation to one another; when, on the contrary, we admit that time and space are continuous, so that two periods of time or points of space are related to one another as continuous, they are, while being two, not two, but identical. In ordinary language we solve the matter in the easiest way, for we say: “Because the second is quicker, it covers a greater distance in the same time as the slow; it can therefore come to the place from which the first started and get further still.” After B, at the end of the first hour, arrives at d and A at e, A in one and the same period, that is, in the second hour, goes over the distance e g, and B the distance d g. But this period of time which should be one, is divisible into that in which B accomplishes d e and that in which B passes through e g. A has a start of the first, by which it gets over the distance e f, so that A is at f at the same period as B is at e. The limitation which, according to Aristotle, is to be overcome, which must be penetrated, is thus that of time; since it is continuous, it must, for the solution of the difficulty, be said that what is divisible into two spaces of time is to be conceived of as one, in which B gets from d to e and from e to g, while A passes over the distance e g. In motion two periods, as well as two points in space, are indeed one.

If we wish to make motion clear to ourselves, we say that the body is in one place and then it goes to another; because it moves, it is no longer in the

first, but yet not in the second; were it in either it would be at rest. Where then is it? If we say that it is between both, this is to convey nothing at all, for were it between both, it would be in a place, and this presents the same difficulty. But movement means to be in this place and not to be in it, and thus to be in both alike; this is the continuity of space and time which first makes motion possible. Zeno, in the deduction made by him, brought both these points into forcible opposition. The discretion of space and time we also uphold, but there must also be granted to them the overstepping of limits, i.e. the exhibition of limits as not being, or as being divided periods of time, which are also not divided. In our ordinary ideas we find the same determinations as those on which the dialectic of Zeno rests; we arrive at saying, though unwillingly, that in one period two distances of space are traversed, but we do not say that the quicker comprehends two moments of time in one; for that we fix a definite space. But in order that the slower may lose its precedence, it must be said that it loses its advantage of a moment of time, and indirectly the moment of space.

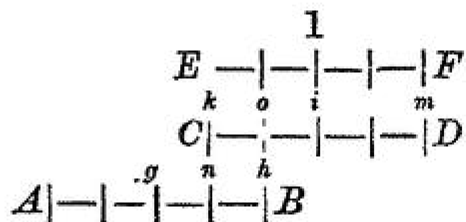
Zeno makes limit, division, the moment of discretion in space and time, the only element which is enforced in the whole of his conclusions, and hence results the contradiction. The difficulty is to overcome thought, for what makes the difficulty is always thought alone, since it keeps apart the moments of an object which in their separation are really united. It brought about the Fall, for man ate of the tree of the knowledge of good and evil; but it also remedies these evils.

(c) The third form, according to Aristotle, is as follows: — Zeno says: "The flying arrow rests, and for the reason that what is in motion is always in the self-same Now and the self-same Here, in the indistinguishable;" it is here and here and here. It can be said of the arrow that it is always the same, for it is always in the same space and the same time; it does not get beyond its space, does not take in another, that is, a greater or smaller space. That,



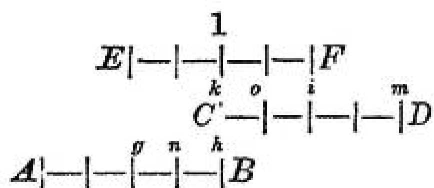
however, is what we call rest and not motion. In the Here and Now, the becoming "other" is abrogated, limitation indeed being established, but only as moment; since in the Here and Now as such, there is no difference, continuity is here made to prevail against the mere belief in diversity. Each place is a different place, and thus the same; true, objective difference does not come forth in these sensuous relations, but in the spiritual.

This is also apparent in mechanics; of two bodies the question as to which moves presents itself before us. It requires more than two places — three at least — to determine which of them moves. But it is correct to say this, that motion is plainly relative; whether in absolute space the eye, for instance, rests, or whether it moves, is all the same. Or, according to a proposition brought forward by Newton, if two bodies move round one another in a circle, it may be asked whether the one rests or both move. Newton tries to decide this by means of an external circumstance, the strain on the string. When I walk on a ship in a direction opposed to the motion of the ship, this is in relation to the ship, motion, and in relation to all else, rest.



In both the first proofs, continuity in progression has the predominance; there is no absolute limit, but an overstepping of all limits. Here the opposite is established; absolute limitation, the interruption of continuity, without however passing into something else; while discretion is presupposed, continuity is maintained. Aristotle says of this proof: "It arises from the fact that it is taken for granted that time consists of the Now; for if this is not conceded, the conclusions will not follow."

(d) "The fourth proof," Aristotle continues, "is derived from similar bodies which move in opposite directions in the space beside a similar body, and with equal velocity, one from one end of the space, the other from the middle. It necessarily results from this that half the time is equal to the double of it. The fallacy rests in this, that Zeno supposes that what is beside

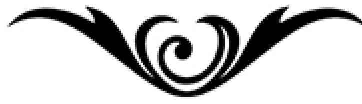


the moving body, and what is beside the body at rest, move through an equal distance in equal time with equal velocity, which, however, is untrue."

In a definite space such as a table (A B) let us suppose two bodies of equal length with it and with one another, one of which (C D) lies with one end (C) on the middle (g) of the table, and the other (E F), being in the same direction, has the point (E) only touching the end of the table (h); and supposing they move in opposite directions, and the former (C D) reaches in an hour the end (h) of the table; we have the result ensuing that the one (E F) passes in the half of the time through the same space (i k) which the other does in the double (g h); hence the half is equal to the double. That is to say, this second passes (let us say, in the point l) by the whole of the first C D. In the first half-hour l goes from m to i, while k only goes from g to n.

In the second half-hour l goes past o to k, and altogether passes from m to k, or the double of the distance.

This fourth form deals with the contradiction presented in opposite motion; that which is common is given entirely to one body, while it only



does part for itself. Here the distance travelled by one body is the sum of the distance travelled by both, just as when I go two feet east, and from the same point another goes two feet west, we are four feet removed from one another; in the distance moved both are positive, and hence have to be added together. Or if I have gone two feet forwards and two feet backwards, although I have walked four feet, I have not moved from the spot; the motion is then nil, for by going forwards and backwards an opposition ensues which annuls itself.

This is the dialectic of Zeno; he had a knowledge of the determinations which our ideas of space and time contain, and showed in them their contradiction; Kant's antinomies do no more than Zeno did here. The general result of the Eleatic dialectic has thus become, "the truth is the one, all else is untrue," just as the Kantian philosophy resulted in "we know appearances only." On the whole the principle is the same; "the content of knowledge is only an appearance and not truth," but there is also a great difference present. That is to say, Zeno and the Eleatics in their proposition signified "that the sensuous world, with its multitudinous forms, is in itself appearance only, and has no truth." But Kant does not mean this, for he asserts: "Because we apply the activity of our thought to the outer world, we constitute it appearance; what is without, first becomes an untruth by the fact that we put therein a mass of determinations. Only our knowledge, the spiritual, is thus appearance; the world is in itself absolute truth; it is our action alone that ruins it, our work is good for nothing." It shows excessive humility of mind to believe that knowledge has no value; but Christ says, "Are ye not better than the sparrows?" and we are so inasmuch as we are thinking; as sensuous we are as good or as bad as sparrows. Zeno's dialectic has greater objectivity than this modern dialectic.

Zeno's dialectic is limited to Metaphysics; later, with the Sophists, it became general. We here leave the Eleatic school, which perpetuates itself

in Leucippus and, on the other side, in the Sophists, in such a way that these last extended the Eleatic conceptions to all reality, and gave to it the relation of consciousness; the former, however, as one who later on worked out the Notion in its abstraction, makes a physical application of it, and one which is opposed to consciousness. There are several other Eleatics mentioned, to Tennemann's surprise, who, however, cannot interest us. "It is so unexpected," he says (Vol. I., p. 190), "that the Eleatic system should find disciples; and yet Sextus mentions a certain Xeniades."

D. Heraclitus.

IF WE PUT aside the Ionics, who did not understand the Absolute as Thought, and the Pythagoreans likewise, we have the pure Being of the Eleatics, and the dialectic which denies all finite relationships. Thought to the latter is the process of such manifestations; the world in itself is the apparent, and pure Being alone the true. The dialectic of Zeno thus lays hold of the determinations which rest in the content itself, but it may, in so far, also be called subjective dialectic, inasmuch as it rests in the contemplative subject, and the one, without this movement of the dialectic, is abstract identity. The next step from the existence of the dialectic as movement in the subject, is that it must necessarily itself become objective. If Aristotle blames Thales for doing away with motion, because change cannot be understood from Being, and likewise misses the actual in the Pythagorean numbers and Platonic Ideas, taken as the substances of the things which participate in them, Heraclitus at least understands the absolute as just this process of the dialectic. The dialectic is thus thre-fold: (*α*) the external dialectic, a reasoning which goes over and over again without ever reaching the soul of the thing; (*β*) immanent dialectic of the object, but falling within the contemplation of the subject; (*γ*) the objectivity of Heraclitus which takes the dialectic itself as principle. The advance requisite and made by Heraclitus is the progression from Being as the first immediate thought, to the category of Becoming as the second. This is the first concrete, the Absolute, as in it the unity of opposites. Thus with Heraclitus the philosophic Idea is to be met with in its speculative form; the reasoning of Parmenides and Zeno is abstract understanding. Heraclitus was thus universally esteemed a deep philosopher and even was decried as such.

Here we see land; there is no proposition of Heraclitus which I have not adopted in my Logic.

Diogenes Laertius says (IX. 1) that Heraclitus flourished about the 69th Olympiad (500 B.C.), and that he was of Ephesus and in part contemporaneous with Parmenides: he began the separation and withdrawal of philosophers from public affairs and the interests of the country, and devoted himself in his isolation entirely to Philosophy. We have thus three stages: (α) the seven sages as statesmen, regents and law-givers; (β) the Pythagorean aristocratic league; (γ) an interest in science for its own sake. Little more is known of Heraclitus' life than his relations to his countrymen the Ephesians, and according to Diogenes Laertius (IX. 15, 3), these were for the most part found in the fact that they despised him and were yet more profoundly despised by him — a relationship such as we have now-a-days, when each man exists for himself, and despises everyone else. In the case of this noble character, the disdain and sense of separation from the crowd emanates from the deep sense of the perversity of the ordinary ideas and life of his people: in reference to this, isolated expressions used on various occasions are still preserved. Cicero (Tusc. Quæst. V. 36) and Diogenes Laertius (IX. 2) relate that Heraclitus said: "The Ephesians all deserve to have their necks broken as they grow up, so that the town should be left to minors" (people now say that only youth knows how to govern), "because they drove away his friend Hermodorus, the best of them all, and gave as their reason for so doing that amongst them none should be more excellent than the rest; and if any one were so, it should be elsewhere and amongst others." It was for the same reason that in the Athenian Democracy great men were banished. Diogenes adds: "His fellow-citizens asked him to take part in the administration of public affairs, but he declined, because he did not like their constitution, laws and administration." Proclus (T. III. pp. 115, 116, ed. Cousin) says: "The noble Heraclitus blamed the people for being

devoid of understanding or thought. ‘What is,’ he says, ‘their understanding or their prudence? Most of them are bad, and few are good.’” Diogenes Laertius (IX. 6) furthermore says: “Antisthenes cites, as a proof of Heraclitus’ greatness, that he left his kingdom to his brother.” He expresses in the strongest manner his contempt for what is esteemed to be truth and right, in the letter preserved to us by Diogenes (IX. 13, 14), in which, to the invitation of Darius Hystaspes, “to make him acquainted with Greek wisdom — for his work on Nature contains a very forcible theory of the world, but it is in many passages obscure — to come to him and explain to him what required explanation” (this is certainly not very probable if Heraclitus’ turn of mind was also Oriental), he is said to have replied: “All mortal men depart from truth and justice and are given over to excess and vain opinions according to their evil understandings. But I, since I have attained to an oblivion of all evil, and shun the overpowering envy that follows me, and the vanity of high position, shall not come to Persia. I am content with little and live in my own way.”

The only work that he wrote, and the title of which, Diogenes tells us, was by some stated to be “The Muses” and by others “On Nature,” he deposited in the temple of Diana at Ephesus. It seems to have been preserved until modern times; the fragments which have come down to us are collected together in Stephanus’ *Poësis philosophica* (p. 129, seq.). Schleiermacher also collected them and arranged them in a characteristic way. The title is “Heraclitus, the Dark, of Ephesus, as represented in fragments of his work and by the testimony of the ancients,” and it is to be found in Wolf and Buttmann’s “Museum of ancient Learning,” vol. I. (Berlin, 1807) pp. 315-533. Seventy-three passages are given. Kreuzer made one hope that he would work at Heraclitus more critically and with a knowledge of the language. He made a more complete collection, particularly from grammarians; however, as, for lack of time, he left it to be

worked up by a younger scholar, and as the latter died, it never came before the public. Compilations of the kind are as a rule too copious: they contain a mass of learning and are more easily written than read. Heraclitus has been considered obscure, and is indeed celebrated for this; it also drew upon him the name of *σκοτεινός*. Cicero (De Nat. Deor. I. 26; III. 14; De Finib. II. 5) takes up a wrong idea, as often happens to him; he thinks that Heraclitus purposely wrote obscurely. Any such design would, however, be a very shallow one, and it is really nothing but the shallowness of Cicero himself ascribed by him to Heraclitus. Heraclitus' obscurity is rather a result of neglecting proper composition and of imperfect language; this is what was thought by Aristotle (Rhet. III. 5), who, from a grammatical point of view, ascribed it to a want of punctuation: "We do not know whether a word belongs to what precedes or what succeeds." Demetrius is of the same opinion (De Elocutione, § 192, p. 78, ed. Schneider). Socrates, as Diogenes Laertius relates (II. 22; IX. 11-12), said of this book: "What he understood of it was excellent, and what he did not understand he believed to be as good, but it requires a vigorous (*Δηλίου*) swimmer to make his way through it." The obscurity of this philosophy, however, chiefly consists in there being profound speculative thought contained in it; the Notion, the Idea, is foreign to the understanding and cannot be grasped by it, though it may find mathematics quite simple.

Plato studied the philosophy of Heraclitus with special diligence; we find much of it quoted in his works, and he got his earlier philosophic education most indubitably from this source, so that Heraclitus may be called Plato's teacher. Hippocrates, likewise, is a philosopher of Heraclitus' school. What is preserved to us of Heraclitus' philosophy at first seems very contradictory, but we find the Notion making its appearance, and a man of profound reflection revealed. Zeno began to abrogate the opposed predicates, and he shows the opposition in movement, an assertion of

limitation and an abrogation of the same; Zeno expressed the infinite, but on its negative side only, in reference to its contradiction as being the untrue. In Heraclitus we see the perfection of knowledge so far as it has gone, a perfecting of the Idea into a totality, which is the beginning of Philosophy, since it expresses the essence of the Idea, the Notion of the infinite, the potentially and actively existent, as that which it is, i.e. as the unity of opposites. From Heraclitus dates the ever-remaining Idea which is the same in all philosophers to the present day, as it was the Idea of Plato and of Aristotle.

1. *The Logical Principle.* Concerning the universal principle, this bold mind, Aristotle tells us (Metaph. IV. 3 and 7), first uttered the great saying: "Being and non-being are the same; everything is and yet is not." The truth only is as the unity of distinct opposites and, indeed, of the pure opposition of being and non-being; but with the Eleatics we have the abstract understanding that Being is alone the truth. We say, in place of using the expression of Heraclitus, that the Absolute is the unity of being and non-being. When we understand that proposition as that "Being is and yet is not," this does not seem to make much sense, but only to imply complete negation and want of thought. But we have another sentence that gives the meaning of the principle better. For Heraclitus says: "Everything is in a state of flux; nothing subsists nor does it ever remain the same." And Plato further says of Heraclitus: "He compares things to the current of a river: no one can go twice into the same stream,"[61] for it flows on and other water is disturbed. Aristotle tells us (Met. IV. 5) that his successors even said "it could not once be entered," for it changed directly; what is, is not again. Aristotle (De Cœlo, III. 1) goes on to say that Heraclitus declares that "there is only one that remains, and from out of this all else is formed; all except this one is not enduring (*παγίως*)."

This universal principle is better characterized as Becoming, the truth of Being; since everything is and is not, Heraclitus hereby expressed that everything is Becoming. Not merely does origination belong to it, but passing away as well; both are not independent, but identical. It is a great advance in thought to pass from Being to Becoming, even if, as the first unity of opposite determinations, it is still abstract. Because in this relationship both must be unrestful and therefore contain within themselves the principle of life, the lack of motion which Aristotle has demonstrated in the earlier philosophies is supplied, and this last is even made to be the principle. This philosophy is thus not one past and gone; its principle is essential, and is to be found in the beginning of my Logic, immediately after Being and Nothing. The recognition of the fact that Being and non-being are abstractions devoid of truth, that the first truth is to be found in Becoming, forms a great advance. The understanding comprehends both as having truth and value in isolation; reason, on the other hand, recognizes the one in the other, and sees that in the one its "other" is contained. If we do not take the conception of existence as complete, the pure Being of simple thought in which everything definite is denied, is the absolute negative; but nothing is the same, or just this self-identity. We here have an absolute transition into the opposite which Zeno did not reach, for he remained at the proposition, "From nothing, comes nothing." With Heraclitus, however, the moment of negativity is immanent, and the Notion of Philosophy as complete is therefore dealt with.

In the first place we have here the abstract idea of Being and non-being in a form altogether immediate and general; but when we look closer, we find that Heraclitus also conceived of the opposites and their unification in a more definite manner. He says: "The opposites are combined in the self-same one, just as honey is both sweet and bitter." Sextus remarks of this (Pyrrh. Hyp. I. 29, §§ 210, 211; II. 6, § 63): "Heraclitus, like the Sceptics,

proceeds from ordinary ideas; no one will deny that healthy men call honey sweet, while those who are sick will say it is bitter." If it is only sweet, it cannot alter its nature in another individual; it would in all places and even to the jaundiced patient be sweet. Aristotle (De mundo, 5) quotes this from Heraclitus: "Join together the complete whole and the incomplete" (the whole makes itself the part, and the meaning of the part is to become the whole), "what coincides and what conflicts, what is harmonious and what discordant, and from out of them all comes one, and from one, all." This one is not an abstraction, but the activity of dividing itself into opposites; the dead infinite is a poor abstraction as compared with the depths of Heraclitus. All that is concrete, as that God created the world, divided Himself, begot a Son, is contained in this determination. Sextus Empiricus mentions (adv. Math. IX. 337) that Heraclitus said: "The part is something different from the whole and is yet the same as the whole; substance is the whole and the part, the whole in the universe and the part in this living being." Plato says in his Symposium (p. 187, Steph.; p. 397, Bekk.) of Heraclitus' principle: "The one, separated from itself, makes itself one with itself like the harmony of the bow and the lyre." He then makes Eryximachus, who speaks in the Symposium, criticize this thus: "In harmony there is discord, or it arises from opposites; for harmony does not arise from height and depth in that they are different, but from their union through the art of music." But this does not contradict Heraclitus, who means the same thing. That which is simple, the repetition of a tone, is no harmony; difference is clearly necessary to harmony, or a definite antithesis; for it is the absolute becoming and not mere change. The real fact is that each particular tone is different from another — not abstractly so from any other, but from *its* other — and thus it also can be one. Each particular only is, in so far as its opposite is implicitly contained in its Notion. Subjectivity is thus the "other" of objectivity and not of a piece of paper, which would

be meaningless; since each is the “other” of the “other” as its “other,” we here have their identity. This is Heraclitus’ great principle; it may seem obscure, but it is speculative. And this to the understanding which maintains the independence of Being and non-being, the subjective and objective, the real and the ideal, is always difficult and dim.

2. *Natural Philosophy.* In his system Heraclitus did not rest content with thus expressing himself in Notions, or with what is purely logical. But in addition to this universal form in which he advanced his principle, he gave his idea a real and more natural form, and hence he is still reckoned as belonging to the Ionic school of natural philosophers. However, as regards this form of reality, historians are at variance; most of them, and amongst others, Aristotle (Met. I. 3, 8), say that he maintained fire to be the existent principle; others, according to Sextus (adv. Math. IX. 360; X. 233), say it was air, and others again assert that he made vapour to be the principle rather than air;[62] even time is, in Sextus (adv. Math. X. 216), given as the primary existence. The question arises as to how this diversity is to be comprehended. It must not be believed that all these accounts are to be ascribed to the inaccuracy of historians, for the witnesses are of the best, like Aristotle and Sextus Empiricus, who do not speak casually of these forms, but definitely, without, however, remarking upon any such differences and contradictions. We seem to have a better reason in the obscurity of the writing of Heraclitus, which might, by the confusion of its expression, give occasion to misunderstanding. But when regarded closer, this difficulty, which is evident when merely looked at superficially, disappears; it is in the profoundly significant conceptions of Heraclitus that the true way out of this difficulty manifests itself. Heraclitus could no longer, like Thales, express water, air or anything similar as an absolute principle — he could no longer do so in the form of a primeval element from which the rest proceeds — because he thought of Being as identical

with non-being, or the infinite Notion; thus the existent, absolute principle cannot with him come forth as a definite and actual thing such as water, but must be water in alteration, or as process only.

a. Understanding the abstract process as time, Heraclitus said: "Time is the first corporeal existence," as Sextus (adv. Math. X. 231, 232) puts it. Corporeal is an unfortunate expression; the Sceptics frequently pick out the crudest expressions or make thoughts crude in the first place so that they may afterwards dispense with them. Corporeal here means abstract sensuousness; time, as the first sensuous existence, is the abstract representation of process. It is because Heraclitus did not rest at the logical expression of Becoming, but gave to his principle the form of the existent, that it was necessary that time should first present itself to him as such; for in the sensuously perceptible it is the first form of Becoming. Time is pure Becoming as perceived, the pure Notion, that which is simple, and the harmony issuing from absolute opposites; its essential nature is to be and not to be in one unity, and besides this, it has no other character. It is not that time *is* or *is not*, for time *is* non-being immediately in Being and Being immediately in non-being: it is the transition out of Being into non-being, the abstract Notion, but in an objective form, i.e. in so far as it is for us. In time there is no past and future, but only the now, and this is, but is not as regards the past; and this non-being, as future, turns round into Being. If we were to say how that which Heraclitus recognized as principle, might, in the pure form in which he recognized it, exist for consciousness, we could mention nothing else but time; and it quite accords with the principle of thought in Heraclitus to define time as the first form of Becoming.

b. But this pure, objective Notion must realize itself more fully, and thus we find in fact, that Heraclitus determined the process in a more markedly physical manner. In time we have the moments of Being and non-being manifested as negative only, or as vanishing immediately; if we wish to

express both these moments as one independent totality, the question is asked, which physical existence corresponds to this determination. To Heraclitus the truth is to have grasped the essential being of nature, i.e. to have represented it as implicitly infinite, as process in itself; and consequently it is evident to us that Heraclitus could not say that the primary principle is air, water, or any such thing. They are not themselves process, but fire is process; and thus he maintains fire to be the elementary principle, and this is the real form of the Heraclitean principle, the soul and substance of the nature-process. Fire is physical time, absolute unrest, absolute disintegration of existence, the passing away of the "other," but also of itself; and hence we can understand how Heraclitus, proceeding from his fundamental determination, could quite logically call fire the Notion of the process.

c. He further made this fire to be a real process; because its reality is for itself the whole process, the moments have become concretely determined. Fire, as the metamorphosis of bodily things, is the transformation and exhalation of the determinate; for this process Heraclitus used a particular word — evaporation (*ἀναθυμίασις*) — but it is rather transition. Aristotle (De anim. I. 2) says of Heraclitus in this regard, that, according to his view, "the soul is the principle because it is evaporation, the origination of everything; it is what is most incorporeal and always in a state of flux." This is quite applicable to the primary principle of Heraclitus.

Furthermore he determined the real process in its abstract moments by separating two sides in it— "the way upwards (*ὁδὸς ἄνω*) and the way downwards (*ὁδὸς κάτω*)" — the one being division, in that it is the existence of opposites, and the other the unification of these existent opposites. Corresponding to these, he had, according to Diogenes (IX. 8), the further determinations "of enmity and strife (*πόλεμος, ἔρις*), and

friendship and harmony (*ὁμολογία*, *εἰρήνη*); of these two, enmity and strife is that which is the principle of the origination of differences; but what leads to combustion is harmony and peace.” In enmity amongst men, the one sets himself up independently of the other, or is for himself and realizes himself; but unity and peace is sinking out of independence into indivisibility or non-reality. Everything is thre-fold and thereby real unity; nature is the never-resting, and the all is the transition out of the one into the other, from division into unity, and from unity into division.

The more detailed accounts of this real process are, in great measure, deficient and contradictory. In this connection, it is in some accounts[63] said of Heraclitus that he defined it thus: “Of the forms taken by fire there is first of all the sea, and then of it half is the earth and the other half the lightning flash (*πρηστήρ*),” the fire which springs up. This is general and very obscure. Diogenes Laertius (IX. 9) says: “Fire is condensed into moisture, and when concrete it becomes water; water hardens into earth and this is the way downwards. The earth then again becomes fluid, and from it moisture supervenes, and from this the evaporation of the sea, from which all else arises; this is the way upwards. Water divides into a dark evaporation, becoming earth, and into what is pure, sparkling, becoming fire and burning in the solar sphere; what is fiery becomes meteors, planets and stars.” These are thus not still, dead stars, but are regarded as in Becoming, as being eternally productive. We thus have, on the whole, a metamorphosis of fire. These oriental, metaphorical expressions are, however, in Heraclitus not to be taken in their strictly sensuous signification, and as if these changes were present to the outward observation; but they depict the nature of these elements by which the earth eternally creates its suns and comets.

Nature is thus a circle. With this in view, we find Heraclitus, according to Clement of Alexandria (Strom. V. 14, p. 711), saying: “The universe was made neither by God nor man, but it ever was and is, and will be, a living

fire, that which, in accordance with its laws, (*μέτρῳ*) kindles and goes out." We now understand what Aristotle says of the principle being the soul, since the latter is evaporation; that is to say, fire, as this self-moving process of the world, is the soul. Another statement follows, which is also found in Clement of Alexandria (Strom. VI. 2, p. 746): "To souls (to the living) death is the becoming water; to water death is the becoming earth; on the other hand from earth, water arises, and from water, the soul." Thus, on the whole, this process is one of extinction, of going back from opposition into unity, of the re-awakening of the former, and of issuing forth from one. The extinction of the soul, of the fire in water, the conflagration that finally results, some, and amongst others, Diogenes Laertius (IX. 8), Eusebius (Præp. Evang. XIV. 3) and Tennemann (Vol. I. p. 218), falsely assert to be a conflagration of the world. What Heraclitus is said to have spoken of as a conflagration of this world, was thought to be an imaginary idea that after a certain time — as, according to our ideas, at the end of the world — the world would disappear in flames. But we see at once from passages which are most clear,[64] that this conflagration is not meant, but that it is the perpetual burning up as the Becoming of friendship, the universal life and the universal process of the universe. In respect of the fact that, according to Heraclitus, fire is the animating, or the soul, we find in Plutarch (De esu. carn. I. p. 995, ed. Xyl.) an expression which may seem odd, namely, that "the driest soul is the best." We certainly do not esteem the most moist the best, but, on the other hand, the one which is most alive; however dry here signifies fiery and thus the driest soul is pure fire, and this is not lifeless but life itself.

These are the principal moments of the real life-process; I will stop here a moment because we here find expressed the whole Notion of speculative reflection regarding Nature. In this Notion, one moment and one element goes over into the other; fire becomes water, water earth and fire. The

contention about the transmutation and immutability of the elements is an old one; in this conception the ordinary, sensuous science of nature separates itself from natural philosophy. In the speculative point of view, which is that of Heraclitus, the simple substance in fire and the other elements in itself becomes metamorphosed; in the other, all transition is abolished and only an external separation of what is already there is maintained. Water is just water, fire is fire, &c. If the former point of view upholds transmutation, the latter believes in the possibility of demonstrating the opposite; it no longer, indeed, maintains water, fire, &c., to be simple realities, for it resolves them into hydrogen, oxygen, &c., but it asserts their immutability. It justly asserts that what is asserted and implied in the speculative point of view, must also have the truth of actuality; for if to be the speculative means to be the very nature and principle of its elements, this must likewise be present. We are wrong in representing the speculative to be something existent only in thought or inwardly, which is no one knows where. It is really present, but men of learning shut their eyes to it because of their limited point of view. If we listen to their account, they only observe and say what they see; but their observation is not true, for unconsciously they transform what is seen through their limited and stereotyped conception; the strife is not due to the opposition between observation and the absolute Notion, but between the one Notion and the other. They show that changes — such as that of water into earth — are non-existent. Even in modern times this transformation was indeed maintained, for when water was distilled, a residuum of earth was found. On this subject, however, Lavoisier carried on a number of very conclusive researches; he weighed all the receptacles, and it was shown that the residuum proceeded from the vessels. There is a superficial process that does not carry us beyond the determinate nature of substance. They say in reference to it, “water does not change into air but only into moisture, and

moisture always condenses back into water again.” But in this they merely fix on a one-sided, insufficient process, and give it out to be the absolute process. In the real process of nature they, however, found by experience that the crystal dissolved gives water, and in the crystal, water is lost and solidifies, or becomes the so-called water of crystallization; they found that the evaporation of the earth is not to be found as moisture, in outward form in the air, for air remains quite pure, or hydrogen entirely disappears in pure air; they have sought in vain to find hydrogen in the atmospheric air. Similarly they discovered that quite dry air in which they can show neither moisture nor hydrogen, passes into mist, rain, &c. These are their observations, but they spoilt all their perceptions of changes by the fixed conception which they brought with them of whole and part, and of consistence out of parts, and of the previous presence as such, of what manifests itself in coming into existence. When the crystal dissolved reveals water, they say, “it is not that water has arisen, for it was already present there.” When water in its decomposition reveals hydrogen and oxygen, that means, according to them, “these last have not arisen for they were already there as such, as the parts of which the water subsists.” But they can neither demonstrate water in crystal nor oxygen and hydrogen in water, and the same is true of “latent heat.” As we find in all expression of perception and experience, as soon as men speak, there is a Notion present; it cannot be withheld, for in consciousness there always is a touch of universality and truth. For the Notion is the real principle, but it is only to cultured reason that it is absolute Notion, and not if it remains, as here, confined in a determinate form. Hence these men necessarily attain to their limits, and they are troubled because they do not find hydrogen in air; hygrometers, flasks full of air brought down from heights by an air-balloon, do not show it to exist. And similarly the water of crystallization is no longer water, but is changed into earth.

To come back to Heraclitus, there is only one thing wanting to the process, which is that its simple principle should be recognized as universal Notion. The permanence and rest which Aristotle gives, may be missed. Heraclitus, indeed, says that everything flows on, that nothing is existent and only the one remains; but that is the Notion of the unity which only exists in opposition and not of that reflected within itself. This one, in its unity with the movement of the individuals, is the genus, or in its infinitude the simple Notion as thought; as such, the Idea has still to be determined, and we shall thus find it again as the *νοῦς* of Anaxagoras. The universal is the immediate simple unity in opposition which goes back into itself as a process of differences; but this is also found in Heraclitus; he called this unity in opposition Fate (*εἱμαρμένη*) or Necessity.[65] And the Notion of necessity is none other than this, that determinateness constitutes the principle of the existent as individual, but in that very way, relates it to its opposite: this is the absolute "connection (*λόγος*) that permeates the Being of the whole." He calls this "the ethereal body, the seed of the Becoming of everything";[66] that to him is the Idea, the universal as reality, as process at rest.

3. *Relation of the Principle to Consciousness.* There is still something else to consider, and that is what position in this principle Heraclitus gives to consciousness; his philosophy has, on the whole, a bent towards a philosophy of nature, for the principle, although logical, is apprehended as the universal nature-process. How does this *λόγος* come to consciousness? How is it related to the individual soul? I shall explain this here in greater detail: it is a beautiful, natural, childlike manner of speaking truth of the truth. The universal and the unity of the principle of consciousness and of the object, and the necessity of objectivity, make their first appearance here. Several passages from Heraclitus are preserved respecting his views of knowledge. From his principle that everything that is, at the same time is

not, it immediately follows that he holds that sensuous certainty has no truth; for it is the certainty for which something exists as actual, which is not so in fact. Not this immediate Being, but absolute mediation, Being as thought of, Thought itself, is the true Being. Heraclitus in this relation says of sensuous perception — according to Clement of Alexandria — (Strom. III. 3, p. 520): “What we see waking is dead, but what we see sleeping, a dream,” and in Sextus (adv. Math. VII. 126, 127), “Men’s eyes and ears are bad witnesses, for they have barbarous souls. Reason (*λόγος*) is the judge of truth, not the arbitrary, but the only divine and universal judge” — this is the measure, the rhythm, that runs through the Being of everything. Absolute necessity is just the having the truth in consciousness; but every thought, or what proceeds from the individual, every relation in which there is only form and which has the content of the ordinary idea, is not such; what is so is the universal understanding, the developed consciousness of necessity, the identity of subjective and objective. Heraclitus says in this connection, according to Diogenes (IX. 1): “Much learning (*πολυμαθίν*) does not instruct the mind, else it had instructed Hesiod, Pythagoras, Xenophanes and Hecatæus. The only wisdom is to know the reason that reigns over all.”

Sextus (adv. Math. VII. 127-133), further describes the attitude of the subjective consciousness, of particular reason, to the universal, to this nature-process. That attitude has still a very physical appearance, resembling the state of mind we suppose in men who are mad or asleep. The waking man is related to things in a universal way, which is in conformity with the relation of the things and is the way in which others also regard them, and yet he still retains his independence. If, and in so far as I stand in the objectively intelligent connection of this state of mind, I am, just because of this externality, in finitude; but waking, I have the knowledge of the necessity of a connection in the form of objectivity, the

knowledge of the universal existence, and thus the Idea in finite form. Sextus puts this in definite form: “Everything that surrounds us is logical and intelligent” — yet not therefore accompanied by consciousness. “If we draw this universal reality through our breath, we shall be intelligent, but we are so waking only, sleeping we are in oblivion.” The waking consciousness of the outer world, what belongs to the sphere of the understanding, is rather what may be called a condition; but here it is taken as the whole of rational consciousness. “For in sleep the channels of feeling are closed and the understanding that is in us is prevented from uniting (*συμφυΐας*) with the surroundings; the breath is the only connection (*πρόσφυσις*) maintained, and it may be compared to a root.” This breath is thus distinguished from the universal breath, i.e. from the being of another for us. Reason is this process with the objective: when we are not in connection with the whole, we only dream. “Separated, the understanding loses the power of consciousness (*μνημονικὴν δύναμιν*) that it formerly had.” The mind as individual unity only, loses objectivity, is not in individuality universal, is not the Thought which has itself as object. “In a waking condition, however, the understanding — gazing through the channels of sense as though it were through a window, and forming a relationship with the surroundings — maintains the logical power.” We here have the ideal in its native simplicity. “In the same way as coals which come near fire, themselves take fire, but apart from it, go out, the part which is cut off from the surroundings in our bodies becomes, through the separation, almost irrational.” This confutes those who think that God gives wisdom in sleep or in somnambulism. But in connection with the many channels it becomes similar to the whole. This whole, the universal and divine understanding, in unity with which we are logical, is, according to Heraclitus, the essence of truth. Hence that which appears as the universal to all, carries with it conviction, for it has part in the universal and divine

Logos, while what is subscribed to by an individual carries with it no conviction from the opposite cause. He says in the beginning of his book on Nature: "Since the surroundings are reason, men are irrational both before they hear and when they first hear. For since what happens, happens according to this reason, they are still inexperienced when they search the sayings and the works which I expound, distinguishing the nature of everything and explaining its relations. But other men do not know what they do awake, just as they forget what they do in sleep." Heraclitus says further: "We do and think everything in that we participate in the divine understanding (*λόγος*). Hence we must follow the universal understanding. But many live as if they had an understanding (*φρόνησιν*) of their own; the understanding is, however, nothing but interpretation" (being conscious) "of the manner in which all is ordered. Hence in so far as we participate in the knowledge (*μνήμης*) of it, we are in the truth; but in so far as we are singular (*ἰδιάσωμεν*) we are in error." Great and important words! We cannot speak of truth in a truer or less prejudiced way. Consciousness as consciousness of the universal, is alone consciousness of truth; but consciousness of individuality and action as individual, an originality which becomes a singularity of content or of form, is the untrue and bad. Wickedness and error thus are constituted by isolating thought and thereby bringing about a separation from the universal. Men usually consider, when they speak of thinking something, that it must be something particular, but this is quite a delusion.

However much Heraclitus may maintain that there is no truth in sensuous knowledge because all that exists is in a state of flux, and that the existence of sensuous certainty is not while it is, he maintains the objective method in knowledge to be none the less necessary. The rational, the true, that which I know, is indeed a withdrawal from the objective as from what is sensuous, individual, definite and existent; but what reason knows within

itself is necessity or the universal of being; it is the principle of thought, as it is the principle of the world. It is this contemplation of truth that Spinoza in his Ethics (P. II. propos. XLIV., coroll. II. p. 118, ed. Paul), calls "a contemplation of things in the guise of eternity." The being-for-self of reason is not an objectless consciousness, or a dream, but a knowledge, that which is for itself; but this being-for-self is awake, or is objective and universal, *i.e.* is the same for all. The dream is a knowledge of something of which I alone know; fancy may be instanced as just such a dream. Similarly it is by feeling that something is for me alone, and that I have something in me as in this subject; the feeling may profess to be ever so elevated, yet it really is the case that for me as this subject, it is what I feel, and not an object independent of me. But in truth, the object is for me something essentially free, and I am for myself devoid of subjectivity; similarly this object is no imaginary one made an object by me alone, but is in itself a universal.

There are, besides, many other fragments of Heraclitus, solitary expressions, such as his saying, "men are mortal gods, and gods immortal men; living is death to the former and dying is their life."[67] Life is the death of the gods, death is the life of the gods; the divine is the rising through thought above mere nature which belongs to death. Hence Heraclitus also says, according to Sextus (adv. Math. VII., 349): "the power of thinking is outside the body," which, in a remarkable way, Tennemann makes into: "outside of men." In Sextus (Pyrrh. Hyp. III. 24, § 230) we further read: "Heraclitus says that both life and death are united in our life as in our death; for if we live, our souls are dead and buried in us, but if we die, our souls arise and live." We may, in fact, say of Heraclitus what Socrates said: "What remains to us of Heraclitus is excellent, and we must conjecture of what is lost, that it was as excellent." Or if we wish to consider fate so just

as always to preserve to posterity what is best, we must at least say of what we have of Heraclitus, that it is worthy of this preservation.

E. Empedocles, Leucippus and Democritus.

WE SHALL TAKE Leucippus and Democritus with Empedocles; in them there is manifested the ideality of the sensuous and also universal determinateness or a transition to the universal. Empedocles was a Pythagorean Italian, whose tendencies were Ionic; Leucippus and Democritus, who incline to the Italians, in that they carried on the Eleatic school, are more interesting. Both these philosophers belong to the same philosophic system; they must be taken together as regards their philosophic thought and considered thus.[68] Leucippus is the older, and Democritus perfected what the former began, but it is difficult to say what properly speaking belongs to him historically. It is certainly recorded that he developed Leucippus' thought, and there is, too, some of his work preserved, but it is not worthy of quotation. In Empedocles we see the commencement of the determination and separation of principles. The becoming conscious of difference is an essential moment, but the principles here have in part the character of physical Being, and though partaking also of ideal Being, this form is not yet thought-form. On the other hand we find in Leucippus and Democritus the more ideal principles, the atom and the Nothing, and we also find thought-determination more immersed in the objective — that is, the beginning of a metaphysics of body; or pure Notions possess the significance of the material, and thus pass over thought into objective form. But the teaching is, on the whole, immature, and is incapable of giving satisfaction.

1. Leucippus and Democritus.

Nothing is accurately known of the circumstances of Leucippus' life, not even where he was born. Some, like Diogenes Laertius (IX. 30), make him out to be an Eleatic; others to have belonged to Abdera (because he was with Democritus), or to Melos — Melos is an island not far from the Peloponnesian coast — or else, as is asserted by Simplicius in writing on Aristotle's Physics (p. 7), to Miletus. It is definitely stated that he was a disciple and a friend of Zeno; yet he seems to have been almost contemporaneous with him as well as with Heraclitus.

It is less doubtful that Democritus belonged to Abdera in Thrace, on the Aegean Sea, a town that in later times became so notorious on account of foolish actions. He was born, it would appear, about the 80th Olympiad (460 B.C.), or Olympiad 77, 3 (470 B.C.); the first date is given by Apollodorus (Diog. Laert. IX. 41), the other by Thrasyllus; Tennemann (Vol. I. p. 415) makes his birth to fall about the 71st Olympiad (494 B.C.). According to Diogenes Laertius (IX. 34), he was forty years younger than Anaxagoras, lived to the time of Socrates, and was even younger than he — that is supposing him to have been born, not in Olympiad 71, but in Olympiad 80. His connection with the Abderites has been much discussed, and many bad anecdotes are told regarding it by Diogenes Laertius. That he was very rich, Valerius Maximus (VIII. 7, ext. 4) judges from the fact that his father entertained the whole of Xerxes' army on its passage to Greece. Diogenes tells (IX. 35, 36) that he expended his means, which were considerable, on journeys to Egypt and in penetrating into the East, but this last is not authentic. His possessions are stated to have amounted to a hundred talents, and if an Attic talent was worth about from 1000 to 1200 thalers, he must undoubtedly have been able to get far enough with that. It is always said that he was a friend and disciple of Leucippus, as Aristotle relates (Met. I. 4), but where they met is not told. Diogenes (IX. 39) goes on: "After he returned from his journeys into his own country, he lived very

quietly, for he had consumed all his substance, but he was supported by his brother and attained to high honour amongst his countrymen" — not through his philosophy, but— "by some prophetic utterances. According to the law, however, he who ran through his father's means could not have a place in the paternal burial-place. To give no place to the calumniator or evil speaker" — as though he had spent his means through extravagance— "he read his work *Διάκοσμος* to the Abderites, and the latter gave him a present of 500 talents, had his statue publicly erected, and buried him with great pomp when, at 100 years old, he died." That this was also an Abderite jest, those who left us this narrative, at least, did not see.

Leucippus is the originator of the famous atomic system which, as recently revived, is held to be the principle of rational science. If we take this system on its own account, it is certainly very barren, and there is not much to be looked for in it; but it must be allowed that we are greatly indebted to Leucippus, because, as it is expressed in our ordinary physics, he separated the universal and the sensuous, or the primary and the secondary, or the essential and the nonessential qualities of body. The universal quality means, in speculative language, the fact that the corporeal is really universally determined through the Notion or the principle of body: Leucippus understood the determinate nature of Being, not in a superficial manner, but in a speculative. When it is said that body has those universal qualities, such as form, impenetrability and weight, we think that the indeterminate conception of body is the essence, and that its essence is something other than these qualities. But speculatively, essential existence is just universal determinations; they are existent in themselves, or the abstract content and the reality of existence. To body as such, there is nothing left for the determination of reality but pure singularity; but it is the unity of opposites, and the unity of these predicates constitutes its reality.

Let us recollect that in the Eleatic philosophy Being and non-being were looked at as in opposition; that only Being is, and non-being, in which category we find motion, change, &c., is not. Being is not as yet the unity turning back, and turned back into itself, like Heraclitus' motion and the universal. It may be said of the point of view that difference, change, motion, &c., fall within sensuous, immediate perception, that the assertion that only Being is, is as contradictory to appearances as to thought; for the nothing, that which the Eleatics abolished, is. Or within the Heraclitean Idea, Being and non-being are the same; Being is, but non-being, since it is one with Being, is as well, or Being is both the predicate of Being and of non-being. But Being and non-being are both expressed as having the qualities of objectivity, or as they are for sensuous perception, and hence they are the opposition of full and empty. Leucippus says this; he expresses as existent what was really present to the Eleatics. Aristotle says (Met. I. 4): "Leucippus and his friend Democritus maintain that the full and the empty are the elements, and they call the one the existent, and the other the non-existent; that is, the full and solid are the existent, the empty and rare, the non-existent. Hence they also say that Being is no more than non-being because the empty is as well as the bodily; and these form the material sources of everything." The full has the atom as its principle. The Absolute, what exists in and for itself, is thus the atom and the empty (*τὰ ἄτομα καὶ τὸ κενόν*): this is an important, if at the same time, an insufficient explanation. It is not atoms as we should speak of them, such, for example, as we represent to ourselves as floating in the air, that are alone the principle, for the intervening nothing is just as essential. Thus here we have the first appearance of the atomic system. We must now give the further signification and determination of this principle.

a. The Logical Principle

The principal point of consideration is the One, existent for itself: this determination is a great principle and one which we have not hitherto had. Parmenides establishes Being or the abstract universal; Heraclitus, process; the determination of being-for-self belongs to Leucippus. Parmenides says that the nothing does not exist at all; with Heraclitus Becoming existed only as the transition of Being into nothing where each is negated; but the view that each is simply at home with itself, the positive as the self-existent one and the negative as empty, is what came to consciousness in Leucippus, and became the absolute determination. The atomic principle in this manner has not passed away, for it must from this point of view always exist; the being-for-self must in every logical philosophy[69] be an essential moment and yet it must not be put forward as ultimate. In the logical progression from Being and Becoming to this thought-determination, Being as existent here and now[70] certainly first appears, but this last belongs to the sphere of finality and hence cannot be the principle of Philosophy. Thus, though the development of Philosophy in history must correspond to the development of logical philosophy, there will still be passages in it which are absent in historical development. For instance, if we wished to make Being as existent here the principle, it would be what we have in consciousness — there are things, these things are finite and bear a relation to one another — but this is the category of our unthinking knowledge, of appearance. Being-for-self, on the other hand, is, as Being, simple relation to itself, but through negation of the other-Being. If I say I am for myself, I not only am, but I negate in me all else, exclude it from me, in so far as it seems to me to be external. As negation of other being, which is just negation in relation to me, being-for-self is the negation of negation and thus affirmation; and this is, as I call it, absolute negativity in which mediation indeed is present, but a mediation which is just as really taken away.

The principle of the One is altogether ideal and belongs entirely to thought, even though we wish to say that atoms exist. The atom may be taken materially, but it is supersensuous, purely intellectual. In our times, too, more especially through the instrumentality of Gassendi, this conception of atoms has been renewed. The atoms of Leucippus are, however, not molecules, the small particles of Physics. In Leucippus, according to Aristotle, (De gen. et corr. I. 8) there is to be found the idea that "atoms are invisible because of the smallness of their body," which is much like the way in which molecules are now-a-days spoken of: but this is merely a way of speaking of them. The One can neither be seen nor shown with magnifying glasses or measures, because it is an abstraction of thought; what is shown is always matter that is put together. It is just as futile when, as in modern times, men try by the microscope to investigate the inmost part of the organism, the soul, and think they can discover it by means of sight and feeling. Thus the principle of the One is altogether ideal, but not in the sense of being in thought or in the head alone, but in such a way that thought is made the true essence of things. Leucippus understood it so, and his philosophy is consequently not at all empirical. Tennemann (Vol. 1, p. 261), on the other hand, says, quite wrongly, "The system of Leucippus is opposed to that of the Eleatics; he recognizes the empirical world as the only objective reality, and body as the only kind of existence." But the atom and the vacuum are not things of experience; Leucippus says that it is not the senses through which we become conscious of the truth, and thereby he has established an idealism in the higher sense and not one which is merely subjective.

b. The Constitution of the World

However abstract this principle might be to Leucippus, he was anxious to make it concrete. The meaning of atom is the individual, the indivisible; in

another form the One is thus individuality, the determination of subjectivity. The universal and, on the other side, the individual, are great determinations which are involved in everything, and men first know what they have in these abstract determinations, when they recognize in the concrete that even there they are predominant. To Leucippus and Democritus this principle, which afterwards came to light with Epicurus, remained physical; but it also appears in what is intellectual. Mind indeed, is also an atom and one; but as one within itself, it is at the same time infinitely full. In freedom, right and law, in exercising will, our only concern is with this opposition of universality and individuality. In the sphere of the state the point of view that the single will is, as an atom, the absolute, may be maintained; the more modern theories of the state which also made themselves of practical effect, are of this kind. The state must rest on the universal, that is, on the will that exists in and for itself; if it rests on that of the individual, it becomes atomic and is comprehended in accordance with the thought-determination of the one, as is the case in Rousseau's *Contrat Social*. From what Aristotle tells us in the passage last quoted, Leucippus' idea of all that is concrete and actual is further this: "The full is nothing simple, for it is an infinitely manifold. These infinitely many, move in the vacuum, for the vacuum exists; their conglomeration brings about origination" (that is, of an existing thing, or what is for the senses), "disintegration and separation result in passing away." All other categories are included here. "Activity and passivity subsist in the fact, that they are contiguous; but their contiguity is not their becoming one, for from that which is truly" (abstractly) "one there does not come a number, nor from that which is truly many, one." Or, it may be said, they are in fact neither passive nor active, "for they merely abide through the vacuum" without having as their principle, process. Atoms thus are, even in their apparent union in that which we call things, separated from one another through the vacuum

which is purely negative and foreign to them, *i.e.* their relation is not inherent in themselves, but is with something other than them, in which they remain what they are. This vacuum, the negative in relation to the affirmative, is also the principle of the movement of atoms; they are so to speak solicited by the vacuum to fill up and to negate it.

These are the doctrines of the atomists. We see that we have reached the extreme limits of these thoughts, for when relation comes into question, we step beyond them. Being and non-being, as something thought, which, when represented for consciousness as differing in regard to one another, are the plenum and the vacuum, have no diversity in themselves; for the plenum has likewise negativity in itself; as independent, it excludes what is different; it is one and infinitely many ones, while the vacuum is not exclusive, but pure continuity. Both these opposites, the one and continuity, being now settled, nothing is easier to imagine than that atoms should float in existent continuity, now being separated and now united; and thus that their union should be only a superficial relation, or a synthesis that is not determined through the inherent nature of what is united, but in which these self-existent beings really remain separated still. But this is an altogether external relationship; the purely independent is united to the independent, and thus a mechanical combination alone results. All that is living, spiritual, &c., is then merely thrown together; and change, origination, creation, are simple union.

However highly these principles are to be esteemed as a forward step, they at once reveal to us their total inadequacy, as is also the case when we enter with them on further concrete determinations. Nevertheless, we need not add what is in great measure added by the conception of a later date, that once upon a time, there was a chaos, a void filled with atoms, which afterwards became united and orderly, and that the world thereby arose; it is now and ever that what implicitly exists is the plenum and the vacuum. The

satisfying point of view which natural science found in such thoughts, is just the simple fact that in these the existent is in its antithesis as what is thought and what is opposed to thought, and is hereby what exists in and for itself. The Atomists are therefore, generally speaking, opposed to the idea of the creation and maintenance of this world by means of a foreign principle. It is in the theory of atoms that science first feels released from the sense of having no foundation for the world. For if nature is represented as created and held together by another, it is conceived of as not existent in itself, and thus as having its Notion outside itself, *i.e.* its principle or origin is foreign to it and it has no principle as such, only being conceivable from the will of another; as it is, it is contingent, devoid of necessity and Notion in itself. In the conception of the atomist, however, we have the conception of the inherency of nature, that is to say, thought finds itself in it, or its principle is in itself something thought, and the Notion finds its satisfaction in conceiving and establishing it as Notion. In abstract existence, nature has its ground in itself and is simply for itself; the atom and the vacuum are just such simple Notions. But we cannot here see or find more than the formal fact that quite general and simple principles, the antithesis between the one and continuity, are represented.

If we proceed from a wider, richer point of view in nature, and demand that from the atomic theory, it, too, must be made comprehensible, the satisfaction at once disappears and we see the impossibility of getting any further. Hence we must get beyond these pure thoughts of continuity and discontinuity. For these negations, the units, are not in and for themselves; the atoms are indivisible and like themselves, or their principle is made pure continuity, so that they may be said to come directly into one clump. The conception certainly keeps them separate and gives them a sensuously represented Being; but if they are alike, they are, as pure continuity, the same as what is empty. But that which is, is concrete and determined. How

then can diversity be conceived of from these principles? Whence comes the determinate character of plants, colour, form? The point is, that though these atoms as small particles may be allowed to subsist as independent, their union becomes merely a combination which is altogether external and accidental. The determinate difference is missed; the one, as that which is for itself, loses all its determinateness. If various matters, electrical, magnetic and luminous, are assumed, and, at the same time, a mechanical shifting about of molecules, on the one hand unity is quite disregarded, and, on the other, no rational word is uttered in regard to the transition of phenomena, but only what is tautological.

Since Leucippus and Democritus wished to go further, the necessity of a more definite distinction than this superficial one of union and separation was introduced, and they sought to bring this about by ascribing diversity to atoms, and, indeed, by making their diversity infinite. Aristotle (Met. I. 4) says: "This diversity they sought to determine in three ways. They say that atoms differ in figure, as A does from N; in order" (place) "as AN from NA; in position" — as to whether they stand upright or lie— "as Z from N. From these all other differences must come." We see that figure, order and posture are again external relationships, indifferent determinations, *i.e.* unessential relations which do not affect the nature of the thing in itself nor its immanent determinateness, for their unity is only in another. Taken on its own account, this difference is indeed inconsistent, for as the entirely simple one, the atoms are perfectly alike, and thus any such diversity cannot come into question.

We here have an endeavour to lead the sensuous back into few determinations. Aristotle (De gen. et corr. I. 8) says in this connection of Leucippus: "He wished to bring the conception of the phenomenal and sensuous perception nearer, and thereby represented movement, origination

and decease, as existent in themselves.” In this we see no more than that actuality from him receives its rights, while others speak only of deception. But when Leucippus in the end represents the atom as also fashioned in itself, he brings existence certainly so much nearer to sensuous perception, but not to the Notion; we must, indeed, go on to fashioning, but so far we are still a long way off from the determination of continuity and discretion. Aristotle (De sensu, 4) therefore says: “Democritus, and most of the other ancient philosophers are, when they speak of what is sensuous, very awkward, because they wish to make all that is felt into something tangible; they reduce everything to what is evident to the sense of touch, black being rough, and white smooth.” All sensuous qualities are thus only led back to form, to the various ways of uniting molecules which make any particular thing capable of being tasted or smelt; and this endeavour is one which is also made by the atomists of modern times. The French particularly, from Descartes onward, stand in this category. It is the instinct of reason to understand the phenomenal and the perceptible, only the way is false; it is a quite unmeaning, undetermined universality. Since figure, order, posture and form, constitute the only determination of what is in itself, nothing is said as to how these moments are experienced as colour, and indeed variety of colour, &c.; the transition to other than mechanical determinations is not made, or it shows itself to be shallow and barren.

How it was that Leucippus, from these poor principles of atoms and of the vacuum, which he never got beyond, because he took them to be the absolute, hazarded a construction of the whole world (which may appear to us as strange as it is empty), Diogenes Laertius tells us (IX. 31-33) in an account which seems meaningless enough. But the nature of the subject allows of little better, and we can do no more than observe from it the barrenness of this conception. It runs thus: “Atoms, divergent in form, propel themselves through their separation from the infinite, into the great

vacuum.” (Democritus adds to this, “by means of their mutual resistance (*ἀντιτυπία*) and a tremulous, swinging motion (*παλμός*).”)[71] “Here gathered, they form one vortex (*δίνην*) where, by dashing together and revolving round in all sorts of ways, the like are separated off with the like. But since they are of equal weight, when they cannot, on account of their number, move in any way, the finer go into outer vacuum, being so to speak forced out; and the others remain together and, being entangled, run one against another, and form the first round system. But this stands apart like a husk that holds within it all sorts of bodies; since these, in pressing towards the middle, make a vortex movement, this encircling skin becomes thin, because from the action of the vortex, they are continually running together. The earth arises in this way, because these bodies, collected in the middle, remain together. That which encircles and which is like a husk, again becomes increased by means of the adherence of external bodies, and since it also moves within the vortex, it draws everything with which it comes in contact to itself. The union of some of these bodies again forms a system, first the moist and slimy, and then the dry, and that which circles in the vortex of the whole; after that, being ignited, they constitute the substance of the stars. The outer circle is the sun, the inner the moon,” &c. This is an empty representation; there is no interest in these dry, confused ideas of circle-motion, and of what is later on called attraction and repulsion, beyond the fact that the different kinds of motion are looked at as the principle of matter.

c. The Soul

Finally Aristotle relates (De anim. I. 2) that in regard to the soul, Leucippus and Democritus said that “it is spherical atoms.” We find further from Plutarch (De plac. phil. IV. 8) that Democritus applied himself to the relation borne by consciousness to the explanation, amongst other things, of

the origin of feelings, because with him, the conceptions that from things fine surfaces, so to speak, free themselves, and fly into the eyes, ears, &c., first began. We see that, thus far, Democritus expressed the difference between the moments of implicit Being and Being-for-another more distinctly. For he said, as Sextus tells us (adv. Math. VII. 135): "Warmth exists according to opinion (*νόμῳ*), and so do cold and colour, sweet and bitter: only the indivisible and void are truthful (*ἐτεῇ*)." That is to say, only the void and indivisible and their determinations are implicit; unessential, different Being, such as warmth, &c., is for another. But by this the way is at once opened up to the false idealism that means to be done with what is objective by bringing it into relation with consciousness, merely saying of it that it is *my* feeling. Thereby sensuous individuality is, indeed, annulled in the form of Being, but it still remains the same sensuous manifold; a sensuously notionless manifold of feeling is established, in which there is no reason, and with which this idealism has no further concern.

2. Empedocles.

The fragments of Empedocles left, have several times been collected. Sturz of Leipzig collected above 400 verses.[72] Peyron arranged a collection of fragments of Empedocles and Parmenides,[73] which was put into print in Leipzig in 1810. In Wolff's Analects, a treatise is to be found on Empedocles by Ritter.

Empedocles' birthplace was Agrigentum in Sicily, while Heraclitus belonged to Asia Minor. We thus come back to Italy, for our history changes about between these two sides; from Greece proper, as the middle point, we have as yet had no philosophies at all. Empedocles, according to Tennemann (Vol. I. p. 415), flourished about the 80th Olympiad (460 B.C.). Sturz (pp. 9, 10) quotes Dodwell's words: (De ætate Pythag. p. 220), which indicate that Empedocles was born in Olympiad 77, 1 (472 B.C.). They are

as follows: “In the second year of the 85th Olympiad Parmenides had reached his 65th year, so that Zeno was born in the second year of the 75th Olympiad;[74] thus he was six years older than his fellow-student Empedocles, for the latter was only one year old when Pythagoras died in the first or second year of the 77th Olympiad.” Aristotle says (Met. I. 3): “In age Empedocles is subsequent to Anaxagoras, but his works are earlier.” But not only did he philosophize earlier as regards time, that is, at a younger age, but in reference to the stage reached by the Notion, his philosophy is earlier and less mature than that of Anaxagoras.

From Diogenes’ accounts of his life (VIII. 59, 60-73), he also seems to have been a kind of magician and sorcerer, like Pythagoras. During his life he was much respected by his fellow-citizens, and, after his death, a statue was erected to him in his native town; his fame extended very far. He did not live apart, like Heraclitus, but in the exercise of great influence on the affairs of the town of Agrigentum, like Parmenides in Elea. He acquired the credit, after the death of Meton, the ruler of Agrigentum, of bringing about a free constitution and equal rights to all citizens. He likewise frustrated several attempts which were made by people of Agrigentum to seize upon the rulership of their city; and when the esteem of his fellow-citizens rose so high that they offered him the crown, he rejected their offers, and lived ever after amongst them as a respected private individual. Both of his life and death much which was fabulous was told. Seeing that he was famous in life, we are told that he wished not to appear to die an ordinary death, as a proof that he was not a mortal man, but had merely passed out of sight. After a feast he is said either to have suddenly disappeared, or else to have been on Etna with his friends, and suddenly to have been seen of them no more. But what became of him was revealed by the fact that one of his shoes was thrown up by Etna, and found by one of his friends; this made it clear that he threw himself into Etna, thereby to withdraw himself from the

notice of mankind, and to give rise to the idea that he did not really die, but that he was taken up amongst the gods.

The origin and occasion for this fable seems to lie in a poem in which there are several verses that, taken alone, make great professions. He says, according to Sturz, (p. 530: Reliquiæ *τῶν καθαρμῶν*, v. 364-376): —

“Friends who dwell within the fort on yellow Acragas
And who in the best of works are busy, I greet you!
To you I am an immortal god, no more a mortal man,
Do ye not see how that where’er I go, all honour me,
My head being ‘circled round with diadems and crowns of green?
When so decked out, I show myself in towns of wealth,
Men and women pray to me. And thousands follow
My steps, to seek from me the way to bliss,
Others ask for prophecies; others again,
Healing words for ailments manifold beseech.
But what is this to me — as though ‘twere anything
By art to conquer much corrupted man.”

But, taken in the context, this laudation means that I am highly honoured, but what is the value of that to me; it expresses weariness of the honour given him by men.

Empedocles had Pythagoreans as pupils, and went about with them; he is sometimes considered to have been a Pythagorean like Parmenides and Zeno, but this is the only ground for such a statement. It is a question whether he belonged to the League; his philosophy has no resemblance to the Pythagorean. According to Diogenes Laertius (VIII. 56), he was also called Zeno’s fellow-pupil. There have, indeed, been many isolated reflections of a physical kind preserved to us, as also some words of exhortation, and in him thought as penetrating within reality, and the

knowledge of nature seem to have attained to greater breadth and compass; we find in him, however, less speculative depth than in Heraclitus, but a Notion more imbued with the point of view of reality, and a culture derived from natural philosophy or the contemplation of nature. Empedocles is more poetic than definitely philosophical; he is not very interesting, and much cannot be made of his philosophy.

As to the particular Notion which governs it, and which really begins in it to appear, we may call it Combination or Synthesis. It is as combination that the unity of opposites first presents itself; this Notion, first opening up with Heraclitus, is, while in a condition of rest, conceived of as combination, before thought grasps the universal in Anaxagoras. Empedocles' synthesis, as a completion of the relationship, thus belongs to Heraclitus, whose speculative Idea, though in reality, is process, but this is so without the individual moments in reality being mutually related as Notions. Empedocles' conception of synthesis holds good to the present day. He also is the originator of the common idea that has even come down to us, of regarding the four known physical elements of fire, air, water, and earth, as fundamental; by chemists they are certainly no longer held to be elements, because they understand by elements a simple chemical substance. I will now give Empedocles' ideas shortly, and draw the many units mentioned into the connection of a whole.

His general ideas Aristotle[75] shortly sums up thus: "To the three elements, fire, air, and water, each of which was in turn considered as the principle from which everything proceeded, Empedocles added the Earth as the fourth corporeal element, saying that it is these which always remain the same, never becoming, but being united and separated as the more or the less, combining into one and coming out of one." Carbon, metal, &c., are not something existing in and for itself which remains constant and never becomes; thus nothing metaphysical is signified by them. But with

Empedocles this undoubtedly is the case: every particular thing arises through some kind of union of the four. These four elements, to our ordinary idea, are not so many sensuous things if we consider them as universal elements; for, looked at sensuously, there are various other sensuous things. All that is organic, for example, is of another kind; and, further, earth as one, as simple, pure earth, does not exist, for it is in manifold determinateness. In the idea of four elements we have the elevation of sensuous ideas into thought.

Aristotle further says in reference to the abstract Notion of their relation to one another (Met. I. 4), that Empedocles did not only require the four elements as principles, but also Friendship and Strife, which we have already met with in Heraclitus; it is at once evident that these are of another kind, because they are, properly speaking, universal. He has the four natural elements as the real, and friendship and strife as the ideal principles, so that six elements, of which Sextus[76] often speaks, make their appearance in lines that Aristotle (Met. II. 4) and Sextus (adv. Math. VII. 92) have preserved: —

"With the earth, we see the earth, with water, water,
With air, heavenly air, with fire, eternal fire,
With love, love is seen, and strife with sorrowful strife."

Through our participation in them they become for us. There we have the idea that spirit, the soul, is itself the unity, the very totality of elements, in which the principle of earth relates to earth, water to water, love to love, &c.[77] In seeing fire, the fire is in us for whom objective fire is, and so on.

Empedocles also speaks of the process of these elements, but he did not comprehend it further; the point to be remarked is that he represented their unity as a combination. In this synthetic union, which is a superficial

relation devoid of Notion, being partly related and partly unrelated, the contradiction necessarily results that at one time the unity of elements is established and at another, their separation: the unity is not the universal unity in which they are moments, being even in their diversity one, and in their unity different, for these two moments, unity and diversity, fall asunder, and union and separation are quite indeterminate relationships. Empedocles says in the first book of his poem on Nature, as given by Sturz (p. 517, v. 106-109): "There is no such thing as a Nature, only a combination and separation of what is combined; it is merely called Nature by men." That is to say, that which constitutes anything, as being its elements or parts, is not as yet called its nature, but only its determinate unity. For example, the nature of an animal is its constant and real determinateness, its kind, its universality, which is simple. But Empedocles does away with nature in this sense, for every thing, according to him, is the combination of simple elements, and thus not in itself the universal, simple and true: this is not what is signified by us when we speak of nature. Now this nature in which a thing moves in accordance with its own end, Aristotle (De gen. et corr. II. 6) misses in Empedocles; in later times this conception was still further lost. Because the elements were thus existent simply in themselves, there was, properly speaking, no process established in them, for in process they are only vanishing moments, and not existent in themselves. Being thus implicit, they must have been unchangeable, or they could not constitute themselves into a unity; for in the one their subsistence, or their implicit existence would be destroyed. But because Empedocles says that things subsist from these elements, he immediately establishes their unity.

These are the principal points in Empedocles' philosophy. I will quote the remarks that Aristotle (Met. I. 4) makes in this regard.

(*α*) "If we wish to follow this up, and do so in accordance with the understanding, not merely stumbling over it like Empedocles, we should say that friendship is the principle of good and strife the principle of evil, so that in a measure we may assert that Empedocles maintained — and was the first to do so — that the evil and the good are the absolute principles, because the good is the principle of all good, and the bad the principle of all evil." Aristotle shows the trace of universality present here; for to him it may be termed essential in dealing with the Notion of the principle, that which is in and for itself. But this is only the Notion, or the thought which is present in and for itself; we have not yet seen such a principle, for we find it first in Anaxagoras. If Aristotle found the principle of motion missed in ancient philosophers, in the Becoming of Heraclitus, he again missed in Heraclitus the still deeper principle of the Good, and hence wished to discover it in Empedocles. By the good the "why" is to be understood, that which is an end in and for itself, which is clearly established in itself, which is on its own account, and through which all else is; the end has the determination of activity, the bringing forth of itself, so that it, as end to itself, is the Idea, the Notion that makes itself objective and, in its objectivity, is identical with itself. Aristotle thus entirely controverts Heraclitus, because his principle is change alone, without remaining like self, maintaining self, and going back within self.

(*β*) Aristotle also says in criticizing further the relationship and determination of these two universal principles of Friendship and Strife, as of union and separation, that "Empedocles neither adequately made use of them nor discovered in them what they involved (*ἐξευρίσκει τὸ ὁμολογούμενον*); for with him friendship frequently divides and strife unites. That is, when the All falls asunder through strife amongst the elements, fire is thereby united into one, and so is each of the other elements." The separation of the elements which are comprised within the

All, is just as necessarily the union amongst themselves of the parts of each element; that which, on the one hand, is the coming into separation, as independent, is at the same time something united within itself. “But when everything through friendship goes back into one, it is necessary that the parts of each element undergo separation again.” The being in one is itself a manifold, a diverse relation of the four diversities, and thus the going together is likewise a separation. This is the case generally with all determinateness, that it must in itself be the opposite, and must manifest itself as such. The remark that, speaking generally, there is no union without separation, no separation without union, is a profound one; identity and non-identity are thought-determinations of this kind which cannot be separated. The reproach made by Aristotle is one that lies in the nature of the thing. And when Aristotle says that Empedocles, although younger than Heraclitus, “was the first to maintain such principles, because he did not assert that the principle of motion is one, but that it is different and opposed,” this certainly relates to the fact that he thought it was in Empedocles that he first found design, although his utterances on the subject were dubious.

(*γ*) As to the real moments in which this ideal realizes itself, Aristotle further says, “He does not speak of them as four” — equivalents in juxtaposition— “but on the contrary as two; fire he puts by itself on the one side, and the three others, earth, air, and water, on the other.” What would be most interesting is the determination of their relationship.

(*δ*) In what deals with the relationship of the two ideal moments, friendship and strife, and of the four real elements, there is thus nothing rational, for Empedocles, according to Aristotle (Met. XII. 10), did not properly separate, but co-ordinated them, so that we often see them in proximity and counted as having equal value; but it is self-evident that

Empedocles also separated these two sides, the real and the ideal, and expressed thought as their relation.

(*ε*) Aristotle says with justice (De gen. et corr. I. 1) that "Empedocles contradicts both himself and appearances. For at one time he maintains that none of the elements springs out of the other, but all else comes from them; and, at another time, he makes them into a whole through friendship, and again destroys this unity through strife. Thus through particular differences and qualities, one becomes water, the other fire, &c. Now if the particular differences are taken away (and they can be taken away since they have arisen), it is evident that water arises from earth, and the reverse. The All was not yet fire, earth, water, and air, when these were still one, so that it is not clear whether he made the one or the many to be, properly speaking, real existence." Because the elements become one, their special character, that through which water is water, is nothing in itself, that is, they are passing into something different; but this contradicts the statement that they are the absolute elements, or that they are implicit. He considers actual things as an intermingling of elements, but in regard to their first origin, he thinks that everything springs from one through friendship and strife. This customary absence of thought is in the nature of synthetic conceptions; it now upholds unity, then multiplicity, and does not bring both thoughts together; as sublated, one is also not one.[78]

F. Anaxagoras.

With Anaxagoras[79] a light, if still a weak one, begins to dawn, because the understanding is now recognized as the principle. Aristotle says of Anaxagoras (Met. I. 3): “But he who said that reason (*νοῦς*), in what lives as also in nature, is the origin of the world and of all order, is like a sober man as compared with those who came before and spoke at random (*εἰκῆ*).” As Aristotle says, hitherto philosophers may “be compared to the fencers who fence in an unscientific way. Just as the latter often make good thrusts in their struggle, though not by any skill, these philosophers seem to speak without any knowledge of what they say.” Now if Anaxagoras, as a sober man amongst drunkards, was the first to reach this consciousness — for he says that pure thought is the actually existent universal and true — he yet, to a considerable extent, still thrusts into space.

The connection of his philosophy with what precedes is as follows: In Heraclitus’ Idea as motion, all moments are absolutely vanishing. Empedocles represents the gathering together of this motion into a unity, but into a synthetic unity; and with Leucippus and Democritus it is the same. With Empedocles, however, the moments of this unity are the existent elements of fire, water, &c., and with the others, pure abstractions, implicit being, thoughts. But in this way universality is directly asserted, for the opposing elements have no longer any sensuous support. We have had Being, Becoming, the One, as principles; they are universal thoughts and not sensuous, nor are they figures of the imagination; the content and its parts are, however, taken from what is sensuous, and they are thoughts in some sort of a determination. Anaxagoras now says that it is not gods, sensuous principles, elements, or thoughts — which really are

determinations of reflection — but that it is the Universal, Thought itself, in and for itself, without opposition, all embracing, which is the substance or the principle. The unity as universal, returns from the opposition into itself, while in the synthesis of Empedocles, what is opposed is still apart from it and independent, and Thought is not Being. Here, however, Thought as pure, free process in itself, is the self-determining universal, and is not distinguished from conscious thought. In Anaxagoras quite new ground is thus opened up.

Anaxagoras concludes this period, and after him a fresh one begins. In accordance with the favourite idea of there being a genealogical descent of principles from the teacher to the taught, because he was an Ionian, he is often represented as perpetuating the Ionic school, and as an Ionic philosopher: Hermotimus of Clazomenæ, too, was his teacher. To support this theory Diogenes Laertius (II. 6) makes him a disciple of Anaximenes, whose birth is, however, placed in Ol. 55-58, or about sixty years earlier than that of Anaxagoras.

Aristotle says (Met. I. 3) that Anaxagoras first began by these determinations to express absolute reality as understanding. Aristotle and others after him, such as Sextus (adv. Math. IX. 7), mention the bare fact that Hermotimus gave rise to this conception, but it was clearly due to Anaxagoras. Little is gained if such a fact were true, since we learn no more about the philosophy of Hermotimus; it cannot have been much. Others have made numerous historical researches respecting this Hermotimus. The name we have already mentioned amongst those of whom it is said that Pythagoras existed in them before he lived as Pythagoras. We also have a story of Hermotimus to the effect that he possessed the peculiar gift of being able to make his soul quit his body. But this did him bad service in the end, since his wife, with whom he had a dispute, and who besides knew very well how matters stood, showed to their acquaintances this soul-

deserted body as dead, and it was burnt before the soul reinstated itself — which soul must have been astonished.[80] It is not worth while to investigate what lies at the ground of these ancient stories, i.e. into how we should regard the matter: we may think of it as implying a state of ecstasy.

We must consider the life of Anaxagoras before his philosophy. Anaxagoras, according to Diogenes (II. 7), born in Ol. 70 (500 B.C.), comes earlier than Democritus, and in age also precedes Empedocles, yet, on the whole, he was contemporaneous with these, as also with Parmenides; he was as old as Zeno, and lived somewhat earlier than Socrates, but still they were acquainted with one another. His native town was Clazomenæ, in Lydia, not very far from Colophon and Ephesus, and situated on an isthmus by which a great peninsula is connected with the mainland. His life is shortly summed up in the statement that he devoted himself to the study of the sciences, withdrew from public affairs; according to Valerius Maximus (VIII. 7, extr. 6) he made numerous journeys, and finally, according to Tennemann (Vol. I. pp. 300, 415), in the forty-fifth year of his age, in the 81st Olympiad (456 B.C.), and at a propitious time, he came to Athens.

With him we thus find Philosophy in Greece proper, where so far there had been none, and coming, indeed, as far as Athens; hitherto either Asia Minor or Italy had been the seat of Philosophy, though, when the inhabitants of Asia Minor fell under Persian rule, with their loss of freedom, it expired amongst them. Anaxagoras, himself a native of Asia Minor, lived in the important period between the war of the Medes and the age of Pericles, principally in Athens, which had now reached the zenith of its greatness, for it was both the head of Grecian power, and the seat and centre of the arts and sciences. Athens, after the Persian wars, brought the greater part of the Greek islands into subjection, as also a number of maritime towns in Thrace, and even further into the Black Sea. As the greatest artists collected in Athens, so also did the most noted philosophers and sophists

live there — a circle of luminaries in the arts and sciences such as we have in Æschylus, Sophocles, Aristophanes, Thucydides, Diogenes of Apollonia, Protagoras, Anaxagoras, and others from Asia Minor. Pericles then ruled the State, and raised it to that height of splendour which may be called the golden age in Athenian life; Anaxagoras, although living in the most flourishing time of Athenian life, touches on its decay, or rather reaches the first threatening of that decay, which ended in a total extermination of this beautiful life.

What is of special interest at this time is the opposition between Athens and Lacedæmon, the two Greek nations which contended with one another for the foremost place in Greece; here we must therefore allude to the principles of these celebrated States. While the Lacedæmonians had no arts or sciences, Athens had to thank the character of its constitution, and of its whole spirit, for the fact that it was the seat of the sciences and fine arts. But the constitution of Lacedæmon is also worthy of high esteem, for it regulated and restrained the high Doric spirit, and its principal feature was that all personal peculiarity was subordinated, or rather sacrificed, to the general aim of the life of the State, and the individual had the consciousness of his honour and sufficiency only in the consciousness of working for the State. A people of such genuine unity, in whom the will of the individual had, properly speaking, quite disappeared, were united by an indestructible bond, and Lacedæmon was hence placed at the head of Greece, and obtained the leadership, which, we find, it held among the Argives in the days of Troy. This is a great principle which must exist in every true State, but which with the Lacedæmonians retained its one-sided character; this one-sidedness was avoided by the Athenians, and by that means they became the greater. In Lacedæmon personality proper was so much disregarded that the individual could not have free development or expression; individuality was not recognized, and hence not brought into

harmony with the common end of the State. This abrogation of the rights of subjectivity, which, expressed in his own way, is also found in Plato's Republic, was carried very far with the Lacedæmonians. But the universal is living spirit only in so far as the individual consciousness finds itself as such within it; the universal is not constituted of the immediate life and being of the individual, the mere substance, but formed of conscious life. As individuality which separates itself from the universal is powerless and falls to the ground, the one-sided universal, the morality of individuality cannot stand firm. The Lacedæmonian spirit, which had not taken into account the freedom of consciousness, and whose universal had isolated itself therefrom, had hence to see it break forth in opposition to the universal; and though the first to come forward as the liberators of Greece from its tyranny were the Spartans, whom even Athens thanks for the expulsion of the descendants of Pisistratus, their relationship to their confederates soon passes into that of common, mean, tyranny. Within the State it likewise ends in a harsh aristocracy, just as the fixed equilibrium of property (each family retaining its inheritance, and through forbidding the possession of money, or trade and commerce, preventing the possibility of inequality in riches) passes into an avarice which, as opposed to this universal, is brutal and mean. This essential moment of particularity, not being taken into the State, and hence not made legal and moral (moral first of all), comes forth as vice. In a rational organization all the elements of the Idea are present; if the liver were isolated as bile it would become not more, and not less active, but becoming antagonistic, it would isolate itself from the corporate economy of the body. Solon, on the contrary, gave to the Athenians not only equality of laws and unity of spirit in their constitution (which was a purer democracy than in Sparta), but although each citizen had his substantial consciousness in unity with the laws of the State, he also gave free play to the individual mind, so that each might do as he would,

and might find expression for himself. Solon entrusted the executive to the people, not to the Ephors, and this became self-government after the displacement of the tyrants, and thus in truth a free people arose; the individual had the whole within himself, as he had his consciousness and action in the whole. Thus we see in this principle the formation of free consciousness and the freedom of individuality in its greatness. The principle of subjective freedom appears at first, however, still in unison with the universal principle of Greek morality as established by law, and even with mythology; and thus in its promulgation, because the genius of its conceptions could develop freely, it brought about these masterpieces in the beautiful plastic arts, and the immortal works of poetry and history. The principle of subjectivity had, thus far, not taken the form that particularity, as such, should be set free, and that its content should be a subjectively particular, at least distinguished from the universal principle, universal morality, universal religion, universal laws. Thus we do not see the carrying out of isolated ideas, but the great, moral, solid, divine content made in these works object for consciousness, and generally brought before consciousness. Later we shall find the form of subjectivity becoming free for itself, and appearing in opposition to the substantial, to morality, religion, and law.

The basis of this principle of subjectivity, though it is still a merely general one, we now see in Anaxagoras. But amongst this noble, free, and cultured people of Athens, he who had the happiness to be first, was Pericles, and this circumstance raised him in the estimation of the individual to a place so high that few could reach it. Of all that is great amongst men, the power of ruling over the will of men who have but one will, is the greatest, for this controlling individuality must be both the most universal and the most living — a lot for a mortal being than which hardly any better can be found. His individuality was, according to Plutarch, (in Pericle 5) as

deep as it was perfect; as serious (he never laughed), as full of energy and restfulness: Athens had him the whole day long. Thucydides has preserved some of Pericles' speeches to the people which allow of few works being compared to them. Under Pericles the highest culture of the moral commonwealth is to be found, the juncture where individuality is still under and also in the universal. Presently individuality prevails, because its activity falls into extremes, since the state as state, is not yet independently organized within itself. Because the essence of the Athenian State was the common spirit, and the religious faith of individuals in this constituted their essence, there disappears with the disappearance of this faith, the inner Being of the people, since the spirit is not in the form of the Notion as it is in our states. The speedy transition to this last is the *νοῦς*, subjectivity, as Being, self-reflection. When Anaxagoras at this time, the principle of which has just been given, came to Athens, he was sought out by Pericles, and, as his friend, lived in very intimate relations with him, before the latter occupied himself with public affairs. But Plutarch (in Pericle 4, 16) also relates that Anaxagoras came to want because Pericles neglected him — did not supply the illuminating lamp with oil.

A more important matter is that Anaxagoras (as happened later with Socrates and many other philosophers) was accused of despising those whom the people accepted as gods. The prose of the understanding came into contact with the poetic, religious point of view. It is distinctly said by Diogenes Laertius (II. 12) that Anaxagoras believed the sun and stars to be burning stones; and he is, according to Plutarch, (in Pericle, 6) blamed for having explained something that the prophets stated to be a marvellous omen, in a natural way; it quite tallies with this that he is said to have foretold that on the day of Ægos-Potamos, where the Athenians lost their last fleet against Lysander, a stone should fall from heaven.[81] The general remark might be made of Thales, Anaximander, &c., that the sun, moon,

earth and stars were counted as mere things, i.e. as objects external to mind, and that they no longer held them to be living gods, but represented them in different ways — which ideas, for the rest, deserve no further consideration, since these matters belong properly to ordinary learning. Things may be derived from thought; thought really brings about the result that certain objects which may be called divine, and certain conceptions of these which may be called poetic, together with the whole range of superstitious beliefs, are demolished — they are brought down to being what are called natural things. For in thought, as the identity of itself and of Being, mind knows itself as the truly actual, so that for mind in thought, the unspiritual and material is brought down to being mere things, to the negative of mind. All the ideas of those philosophers have this in common, that nature is through them undeified; they brought the poetic view of nature down to the prosaic, and destroyed the poetic point of view which ascribes to all that is now considered to be lifeless, a life proper to itself, perhaps also sensation, and, it may be, a being after the usual order of consciousness. The loss of this point of view is not to be lamented as if unity with nature, pure faith, innocent purity and childlike spirit went with it. Innocent and childlike it may certainly have been, but reason is just the going forth from such innocence and unity with nature. So soon as mind grasps itself, is for itself, it must for that very reason confront the ‘other’ of itself as a negation of consciousness, i.e. look on it as something devoid of mind, an unconscious and lifeless thing, and it must first come to itself through this opposition. There is in this a fixing of self-moving things such as are met with in the myths of the ancients, who relate such tales as that the Argonauts secured the rocks on the Straits of the Hellespont which formerly moved like scissors. Similarly progressive culture consolidated that which formerly was thought to have its own motion and life in itself, and made it into unmoving matter. This transition of the mythical point of view into the prosaic, here

comes to be recognized by the Athenians. A prosaic point of view such as this, assumes that man has requirements quite different from those he formerly had; in this we find traces of the powerful, necessary conversion brought about in the ideas of man through the strengthening of thought, through knowledge of himself, and through Philosophy.

The institution of charges of atheism, which we shall touch upon more fully in dealing with Socrates, is, in Anaxagoras' case, quite comprehensible, from the specific reason that the Athenians, who were envious of Pericles, who contended with him for the first place, and who did not venture to proceed against him openly, took his favourites to law, and sought through charges against his friend, to injure him. Thus his friend Aspasia was brought under accusation, and the noble Pericles had, according to Plutarch (in Pericle, 32), in order to save her from condemnation, to beg the individual citizens of Athens with tears for her acquittal. The Athenian people in their freedom, demanded such acts of the potentates to whom they allowed supremacy, for thereby an acknowledgment was given of their subordination to the people; they thus made themselves the Nemesis in respect to the high place accorded to the great, for they placed themselves in a position of equality with these, while these again made evident their dependence, subjection and powerlessness before the others. What is told about the result of this charge against Anaxagoras is quite contradictory and uncertain: Pericles certainly saved him from condemnation to death. He was either, as some say, condemned only to banishment after Pericles had led him before the people, speaking and entreating for him, after, by reason of his age, attenuation and weakness the sympathy of the people had been aroused; or else, as others say, with the help of Pericles, he escaped from Athens and was in absence condemned to death, the judgment never being executed upon him. Others again say that he was liberated, but from the vexation that he felt respecting these charges,

and from apprehension as to their repetition, he voluntarily left Athens. And at about sixty or seventy years of age, he died in Lampsacus in the 88th Olympiad (428 B.C.).[82]

1. *The Universal Principle.* The logical principle of Anaxagoras was that he recognized the *νοῦς* as the simple, absolute essence of the world. The simplicity of the *νοῦς* is not a Being but a universality which is distinguished from itself, though in such a way that the distinction is immediately sublated and the identity is set forth for itself. This universal for itself, sundered, exists in purity only as thought; it exists also in nature as objective existence, but in that case no longer purely for itself, but as having particularity as an immediate in it. Space and time are, for example, the most ideal, universal facts in nature as such, but there is no pure space, no pure time and motion any more than any pure matter — for this universal is immediately defined space, air, earth, &c. In thought, when I say, I am I, or I = I, I certainly distinguish something from me, but the pure unity remains; there is no movement but a distinction which is not distinguished, or the being-for-me. And in all that I think, if the thought has a definite content, it is my thought: I am thus known to myself in this object. This universal which thus exists for itself and the individual, or thought and being, thus, however, come into definite opposition. Here the speculative unity of this universal with the individual should be considered as it is posited as absolute unity, but the comprehension of the Notion itself is certainly not found with the ancients. We need not expect a pure Notion such as one of an understanding realizing itself into a system, organized as a universe.

How Anaxagoras enunciated the Notion of the *νοῦς*, Aristotle (De anim. I. 2) goes on to tell: "Anaxagoras maintains that the soul is the principle of movement. Yet he does not always express himself fully about the soul and *νοῦς*: he seems to separate *νοῦς* and soul from one another, and still he

makes use of them as though they were the same existence, only that by preference he makes the *νοῦς* the principle of everything. He certainly speaks frequently of the *νοῦς* as of the cause of the beautiful and right, but another time he calls it the soul. For it is in all animals, in large as well as small, the higher kind and the lower; it alone of all existence is the simple, unadulterated and pure; it is devoid of pain and is not in community with any other."[83] What we therefore have to do is to show from the principle of motion, that it is the self-moving; and this thought is, as existent for itself. As soul, the self-moving is only immediately individual; the *νοῦς*, however, as simple, is the universal. Thought moves on account of something: the end is the first simple which makes itself result; this principle with the ancients is grasped as good and evil, i.e. end as positive and negative. This determination is a very important one, but with Anaxagoras it was not fully worked out. While in the first place the principles are material, from these Aristotle then distinguishes determination and form, and thirdly he finds in the process of Heraclitus, the principle of motion. Then in the fourth place there comes the reason why, the determination of end, with the *νοῦς*; this is the concrete in itself. Aristotle adds in the above-mentioned passage (p. 192), "according to these men" (the Ionians and others) "and in reference to such causes" (water, fire, &c.), "since they are not sufficient to beget the nature of things, the philosophers are, as already said, compelled by the truth to go on to the principle following (*ἐχομένην*). For neither the earth nor any other principle is capable of explaining the fact that while on the one hand all is good and beautiful, on the other, something else is produced, and those men do not seem to have thought that this was so; nor is it seemly to abandon such matters to hazard (*αὐτομάτῳ*) and to chance." Goodness and beauty express the simple restful Notion, and change the Notion in its movement.

With this principle comes the determination of an understanding as of self-determining activity; this has hitherto been wanting, for the Becoming of Heraclitus, which is only process, is not yet as fate, the independently self-determining. By this we must not represent to ourselves subjective thought; in thinking we think immediately of our thought as it is in consciousness. Here, on the contrary, quite objective thought is meant, active understanding — as we say, there is reason in the world, or we speak of genera in nature which are the universal. The genus animal is the substantial of the dog; the dog itself is this; the laws of nature are themselves nature's immanent essence. The nature is not formed from without as men make a table; this is also made with understanding, but through an understanding outside of this wood. This external form, which is called the understanding, immediately occurs to us in speaking of the understanding; but here the universal is meant, that which is the immanent nature of the object itself. The *νοῦς* is thus not a thinking existence from without which regulates the world; by such the meaning present to Anaxagoras would be quite destroyed and all its philosophic interest taken away. For to speak of an individual, a unit from without, is to fall into the ordinary conception and its dualism; a so-called thinking principle is no longer a thought, but is a subject. But still the true universal is for all that not abstract, but the universal is just the determining in and out of itself of the particular in and for itself. In this activity, which is independently self-determining, the fact is at once implied that the activity, because it constitutes process, retains itself as the universal self-identical. Fire, which, according to Heraclitus, was process, dies away and merely passes over, without independent existence, into the opposite; it is certainly also a circle and a return to fire, but the principle does not retain itself in its determinateness as the universal, seeing that a simple passing into the opposite takes place. This relation to itself in determination which we see

appearing in Anaxagoras, now, however, contains the determination of the universal though it is not formally expressed, and therein we have the end or the Good.

I have just recently (p. 316) spoken of the Notion of the end, yet by that we must not merely think of the form of the end as it is in us, in conscious beings. At first, end, in as far as I have it, is my conception, which is for itself, and the realization of which depends on my wish; if I carry it out, and if I am not unskilful, the object produced must be conformable to the end, containing nothing but it. There is a transition from subjectivity to objectivity through which this opposition is always again sublated. Because I am discontented with my end in that it is only subjective, my activity consists in removing this defect and making it objective. In objectivity the end has retained itself; for instance, if I have the end in view of building a house and am active for that end, the house results in which my end is realized. But we must not, as we usually do, abide at the conception of this subjective end; in this case both I and the end exist independently and externally in relation to each other. In the conception that God, as wisdom, rules the world in accordance with an end, for instance, the end is posited for itself in a wise, figuratively conceiving Being. But the universal of end is the fact that since it is a determination independently fixed, that rules present existence, the end is the truth, the soul of a thing. The Good in the end gives content to itself, so that while it is active with this content, and after it has entered into externality, no other content comes forth than what was already present. The best example of this is presented in life; it has desires, and these desires are its ends; as merely living, however, it knows nothing of these ends, but yet they are first, immediate determinations which are established. The animal works at satisfying these desires, i.e. at reaching the end; it relates itself to external things, partly mechanically, partly chemically. But the character of its activity does not remain

mechanical or chemical; the product is rather the animal itself, which, as its own end, brings forth in its activity only itself, since it negates and overturns those mechanical or chemical relationships. In mechanical and chemical process, on the other hand, the result is something different, in which the subject does not retain itself; but in the end, beginning and end are alike, for we posit the subjective objectively in order to receive it again. Self-preservation is a continual production by which nothing new, but always the old, arises; it is a taking back of activity for the production of itself.

Thus this self-determining activity, which is then active on something else, enters into opposition, but it again negates the opposition, governs it, in it reflects upon itself; it is the end, the thought, that which conserves itself in its self-determination. The development of these moments is the business of Philosophy from henceforth. But if we look more closely as to how far Anaxagoras has got in the development of this thought, we find nothing further than the activity determining from out of itself, which sets up a limit or measure; further than the determination of measure, development does not go. Anaxagoras gives us no more concrete definition of the *νοῦς*, and this we are still left to consider; we thus have nothing more than the abstract determination of the concrete in itself. The above-mentioned predicates which Anaxagoras gives the *νοῦς*, may thus indeed be affirmed, but they are, on their own account, one-sided only.

2. *The Homœomeriæ.* This is the one side in the principle of Anaxagoras; we now have to consider the going forth of the *νοῦς* into further determinations. This remaining part of the philosophy of Anaxagoras at first, however, makes us think that the hopes in which such a principle justified us must be very much diminished. On the other side, this universal is confronted by Being, matter, the manifold generally, potentiality as distinguished from the former as actuality. For if the Good or the end is also

determined as potentiality, the universal, as the self-moving, may rather be called the actual in itself, the being-for-self, as opposed to implicit being, potentiality, passivity. Aristotle says in an important passage (Met. I. 8): "If any one should say of Anaxagoras that he adopted two principles, he would rest his statement on a point respecting which the latter never really clearly defined himself, but which he had necessarily to acknowledge to those who adduced it.... That is, Anaxagoras says that originally everything is mingled.... But where nothing is yet separated, no distinguishing feature is present; such substance is neither a white, black, gray, nor any other colour, but colourless; it has no quality nor quantity nor determination (*τί*). All is mingled except the *νοῦς*; this is unmingled and pure. With this in view, it thus occurs to him to denominate as principles the one, for it alone is single and unmingled, and the other-being (*θάτερον*), what we call the indeterminate, before it has become determined or partakes of any kind of form."

This other principle is celebrated under the name of homœomeries (*ὁμοιομερῆ*), of like parts or homogeneous, in Aristotle's rendering (Met. I. 3, 7); Riemer translates *ἡ ὁμοιομερεια* "the similarity of individual parts to the whole," and *αἱ ὁμοιομέρειαι* "the elementary matter," yet this latter word seems to be of a later origin.[84] Aristotle says, "Anaxagoras sets forth" (in respect of the material) "infinitely many principles, for he maintained that, like water and fire in Empedocles' system, nearly all that is formed of like parts only arises from union and passes away through separation; other arising and passing away there is none, for equal parts remain eternal." That is, the existent, the individual matter, such as bones, metal, flesh, &c., in itself consists of parts like itself — flesh of small particles of flesh, gold of small gold particles, &c. Thus he said at the beginning of his work, "All has been alike" (i.e. unseparated as in a chaos), "and has rested for an infinitude of time; then came the *νοῦς*, and it brought in movement, separated and

brought order into the separated creation (*διεκόσμησεν*), in that it united the like."[85]

The homœomeriæ become clearer if we compare them with the conceptions of Leucippus and Democritus and others. In Leucippus and Democritus, as well as Empedocles, we saw this matter, or the absolute as objective existence, determined so that simple atoms — with the latter the four elements and with the former infinitely many — were set forth as separate only in form; their syntheses and combinations were existing things. Aristotle (De cœlo, III. 3) says further on this point, "Anaxagoras asserts of the elements the opposite to Empedocles. For the latter takes as original principles, fire, air, earth, and water, through whose union all things arise. On the other hand, Anaxagoras maintains what are of like parts such as flesh, bones, or the like to be simple materials; such things as water and fire, on the contrary, are a mixture of the original elements. For any one of these four consists of the infinite admixture of all invisible, existing things of like parts, which hence come forth from these." The principle held good for him as for the Eleatics, that "the like only comes out of the like; there is no transition into the opposite, no union of opposites possible." All change is hence to him only a separation and union of the like; change as true change, would be a Becoming out of the negative of itself. "That is, because Anaxagoras," says Aristotle (Phys. I, 4), "partook of the view of all physicists that it is impossible that anything can come out of nothing, there was nothing left but to admit that what becomes was already present as an existent, but that, on account of its small size, it was imperceptible to us." This point of view is also quite different from the conception of Thales and Heraclitus, in which, not only the possibility, but the actuality of the transformation of these like qualitative differences is essentially maintained. But to Anaxagoras with whom the elements are a mingled chaos formed therefrom, having only an apparent uniformity, concrete things arise

through the severance of these infinitely many principles from such a chaos, since like finds like. Respecting the difference between Empedocles and Anaxagoras, there is further what Aristotle adds in the same place: “The former allows a change (*περίοδον*) in these conditions, the latter only their one appearance.” The conception of Democritus is similar to that of Anaxagoras in so far as that an infinite manifold is the original source. But with Anaxagoras the determination of the fundamental principles appears to contain that which we consider as organized, and to be by no means an independently existent simple; thus perfectly individualized atoms such as particles of flesh and of gold, form, through their coming together, that which appears to be organized. That comes near our ordinary ideas. Means of nourishment, it is thought, contain such parts as are homogeneous to blood, flesh, &c. Anaxagoras hence says, according to Aristotle (De gen. anim. I. 18), “Flesh comes to flesh through food.” Digestion is thus nothing more than the taking up of the homogeneous and separation of the heterogeneous; all nourishment and growth is thus not true assimilation but only increase, because each internal organ of the animal only draws its parts to itself out of the various plants, bodies, &c. Death is, on the other hand, the separation of the like and the mingling with the heterogeneous. The activity of the *νοῦς*, as the sundering of the like out of the chaos and the putting together of the like, as also the setting at liberty again of this like, is certainly simple and relative to itself, but purely formal and thus for itself contentless.

This is the general standpoint of the philosophy of Anaxagoras, and quite the same standpoint which in more recent times reigns in chemistry for instance; flesh is certainly no longer regarded as simple, but as being hydrogen, &c. The chemical elements are oxygen, hydrogen, carbon and metals, &c. Chemistry says, if you want to know what flesh, wood, stone, &c., really are, you must set forth their simple elements, and these are

ultimate. It also says that much is only relatively simple, *e.g.* platinum consists of three or four metals. Water and air were similarly long held to be simple, but chemistry at length analyzed them. From this chemical point of view, the simple principles of natural things are determined as infinitely qualitative and thus accepted as unchangeable and invariable, so that all else consists only of the combination of these simples. Man, according to this, is a collection of carbon and hydrogen, some earth, oxides, phosphorus, &c. It is a favourite idea of the physicists to place in the water or in the air, oxygen and carbon, which exist and only require to be separated. This idea of Anaxagoras certainly also differs from modern chemistry; that which we consider as concrete, is for him qualitatively determined or elementary. Yet he allows, with regard to flesh, that the parts are not all alike. "For this reason, they say," remarks Aristotle (Phys. I. 4; Met. IV. 5), — but not particularly of Anaxagoras— "everything is contained in everything, for they saw everything arise out of everything: it only appears to be different and is called different in accordance with the predominating number of the particular kind of parts which have mingled themselves with others. In truth the whole is not white, or black, or sweet, or flesh, or bones; but the homœomeriæ which have most accumulated in any place, bring about the result that the whole appears to us as this determinate." As thus each thing contains all other things, water, air, bones, fruits, &c., on the other hand, the water contains flesh as flesh, bones, &c. Into this infinitely manifold nature of the principles, Anaxagoras thus goes back; the sensuous has first arisen through the accumulation of all those parts, and in it the one kind of parts then has a predominance.

While he defines absolute existence as universal, we see here that in objective existence, or in matter, universality and thought abandon Anaxagoras. The implicit is to him, indeed, no absolutely sensuous Being; the homœomeriæ are the non-sensuous, *i.e.* the invisible and inaudible, &c.

This is the highest point reached by common physicists in passing from sensuous Being to the non-sensuous, as to the mere negation of the being-for-us; but the positive side is that existent Being is itself universal. The objective is to Anaxagoras certainly the *νοῦς*, but for him the other-Being is a mixture of simple elements, which are neither flesh nor fish, red nor blue; again this simple is not simple in itself, but in its essence consists of homœomeriæ, which are, however, so small that they are imperceptible. The smallness thus does not take away their existence, for they are still there; but existence is just the being perceptible to sight, smell, &c. These infinitely small homœomeriæ undoubtedly disappear in a more complete conception; flesh, for instance, is such itself, but it is also a mixture of everything, *i.e.* it is not simple. Further analysis equally shows how such a conception must, to a greater or lesser degree, become confused; on the one side each form is thus in its main elements, original, and these parts together constitute a corporeal whole; this whole has, however, on the other side, to contain everything in itself. The *νοῦς*, then, is only what binds and separates, what divides and arranges (*das diakosmirende*). This may suffice us; however easily we may get confused with the homœomeriæ of Anaxagoras, we must hold fast to the main determination. The homœomeriæ still form a striking conception, and it may be asked how it conforms with the rest of Anaxagoras' principle.

3. *The Relation of the Two.* Now as to the relation of the *νοῦς* to that matter, both are not speculatively posited as one, for the relation itself is not set forth as one, nor has the Notion penetrated it. Here the ideas become in some measure superficial, and in some measure the conceptions are more consistent as regards the particular, than they at first appear. Because the understanding is the self-determining, the content is end, it retains itself in relation to what is different; it does not arise and pass away although it is in activity. The conception of Anaxagoras that concrete principles subsist and

retain themselves, is thus consistent; he abolishes arising and passing away and accepts only an external change, a uniting together, and a severance of what is so united. The principles are concrete and have content, *i.e.* so many ends; in the change that takes place the principles really retain themselves. Like only goes with like even if the chaotic mixture is a combination of the unlike; but this is only a combination and not an individual, living form which maintains itself, binding like to like. Thus, however rude these ideas are, they are still really in harmony with the *νοῦς*.

But if the *νοῦς* is with Anaxagoras the moving soul in all, it yet remains to the real, as the soul of the world and the organic system of the whole, a mere word. For the living as living, since the soul was conceived of as principle, the ancients demanded no further principle (for it is the self-moving), but for determinateness, which the animal is as element in the system of the whole, they again required only the universal of these determinations. Anaxagoras calls the understanding such a principle, and in fact the absolute Notion, as simple existence, the self-identical in its differences, the dividing, the reality-establishing, must be known as such. But that Anaxagoras showed forth the understanding in the universe, or had grasped it as a rational system — of this not only do we not find a trace, but the ancients expressly say that he simply let the matter pass, just as when we say that the world or nature is a great system, the world is wisely ordered or is generally speaking rational. By this we are shown no more of the realization of this reason or the comprehensibility of the world. The *νοῦς* of Anaxagoras is thus still formal, although the identity of the principle with the realization was recognized. Aristotle (Met. I. 4) recognizes the insufficiency of the Anaxagorean principle: “Anaxagoras, indeed, requires the *νοῦς* for his formation of the world-system; that is, when he has a difficulty in showing the reason for which it is in accordance with necessity,

he brings it in; otherwise he employs anything for the sake of explanation, rather than thought.”

It is nowhere more clearly set forth that the *νοῦς* of Anaxagoras is still formal, than in the well-known passage out of Plato’s Phædo (p. 97-99, Steph.; p. 85-89, Bekk.), which is noteworthy for its exposition of the philosophy of Anaxagoras. Socrates, according to Plato, states most definitely both what the absolute to them was, and why Anaxagoras did not satisfy them. I quote this because it will best of all lead us on to the main conception which we recognize in the philosophic consciousness of the ancients; at the same time it is an example of the loquacity of Socrates. Socrates’ understanding of the *νοῦς* as end is better because its determinations are congenial to him, so that we also see in it the principal forms that appear in Socrates. Plato makes Socrates, in prison, an hour before his death, relate at considerable length his experiences with regard to Anaxagoras: “When I heard it read from a book of Anaxagoras, that he said that the understanding is the disposer of the world and the first cause, I rejoiced in such a cause, and I held that if Mind apportioned out all reality, it would apportion it for the best” (the end would be shown forth). “Now if anyone wished to find the cause of the individual thing, how it becomes, and how it passes away, or how it is, he must discover this from what is best for that thing, whether it is being or in some way suffering or doing.” That the understanding is cause, or that everything is made for the best, means the same thing; this will become clearer from the opposite. It is further said, “For this reason a man has only to consider for himself, as for all others, what is best and most perfect, and then he would of necessity know the worse, for the same science comprises both. Thus reflecting, I rejoiced that I could believe that I had found in Anaxagoras a teacher of the cause of existence” (of the good) “such as I approved of; he would, I believed, tell me whether the earth was flat or round, and if he told me this, he would

show me the cause and necessity of the fact, because he would show me the one or the other as being the better; and if he said that the earth is in the centre, he would show me that it was better that it should be in the centre" (i.e. its implicitly and explicitly determined end, and not utility as an externally determined end). "And when he had shown me this, I should be satisfied though he brought forward no other kind of causes, for the same would hold good for the sun, the moon, and the other stars, their respective velocities, returnings, and other conditions. Because he assigned its cause to each and to all in common, I thought that he would explain what was best for each and what was best for all" (the free, implicitly and explicitly existent Idea, the absolute end). "I would not have given up this hope for a great deal, but seized these writings zealously and read them as soon as possible in order to learn as soon as possible the good and the evil. These bright hopes faded when I saw that he did not require thought at all nor any reason for the formation of things, but had recourse to air, fire, water and many other eccentricities." We here see how to what is best, according to the understanding (the relation of final end), that which we call natural causes is opposed, just as in Leibnitz the operating and the final causes are different.

Socrates explains this in the following way: "It appears to me to be as if some one were to say that Socrates performs all his actions with understanding, and then in going on to give the reasons for each of my actions, were to say that I sit here because my body consists of bones and muscles; the bones are fixed and have joints that divide them (*διαφυὰς*), but the muscles have the power of extending and bending, and they cover the bones with flesh and skin; it is as though he were further to bring forward as the cause of my talking with you, other similar causes, sounds, and air, hearing, and a thousand other things, but omitted to give the true cause" (free independent determination), "which is that the Athenians judged it fit

to condemn me, and therefore I judged it better and more just to sit here and to suffer the punishment which they accorded" (we must recollect that one of his friends had arranged everything for the flight of Socrates, but that he refused to go) "for else, by the dog of Egypt, how long ago would these bones and muscles have gone to Megara or to Boeotia, had they been moved only by their opinion of what was best, and had I not considered it juster and better to bear the punishment which the State laid upon me, instead of escaping and fleeing from it." Plato here correctly places the two kinds of reason and cause in opposition to one another — the cause proceeding from ends, and the inferior, subject, and merely external causes of chemistry, mechanism, &c. — in order to show the discrepancy between them, as here exemplified in the case of a man with consciousness. Anaxagoras seems to define an end and to wish to proceed from it; but he immediately lets this go again and proceeds to quite external causes. "But to call these" (these bones and muscles) "causes is quite improper. If, however, anyone were to say that without having bones and muscles and whatever else I have, I could not do that which I consider best, he would be quite right. But to say that from such causes, I do that which I do, and do with understanding; to say that I do not do it from the choice of what is best — to make such an assertion shows a great want of consideration; it signifies an incapacity to distinguish that the one is the true cause and the other is only that without which the cause could not operate," *i.e.* the conditions.

This is a good example for showing that we miss the end in such modes of explanation. On the other hand, it is not a good example, because it is taken from the kingdom of the self-conscious will, where deliberate and not unconscious end reigns. In this criticism of the Anaxagorean *νοῦς* we can certainly see it generally expressed that Anaxagoras made no application of his *νοῦς* to reality. But the positive element in the conclusion of Socrates

seems, on the other hand, to be unsatisfying, because it goes to the other extreme, namely, to desire causes for nature which do not appear to be in it, but which fall outside of it in consciousness. For what is good and beautiful is partly due to the thought of consciousness as such; end or purposive action is mainly an act of consciousness and not of nature. But in so far as ends become posited in nature, the end, as end, on the other hand, falls outside of it in our judgment only; as such it is not in nature itself, for in it there are only what we call natural causes, and for its comprehension we have only to seek and show causes that are immanent. According to this, we distinguish, for instance, in Socrates the end and ground of his action as consciousness, and the causes of his actual action: and the latter we would undoubtedly seek in his bones, muscles, nerves, &c. Since we banish the consideration of nature in relation to ends — as present in our thought and not existent in nature — we also banish from our consideration teleological explanations in nature formerly admired, *e.g.* that grass grows that animals may eat it, and that these last exist and eat grass, so that we may eat them. The end of trees is said to be that their fruit may be consumed and that they should give us wood for heat; many animals have skins for warm clothing; the sea in northern climates floats timber to the shores because on these shores themselves no wood grows, and the inhabitants can hence obtain it, and so on. Thus presented, the end, the Good, lies outside of the thing itself: the nature of a thing then becomes considered, not in and for itself, but only in relation to another which is nothing to it. Thus, because things are only useful for an end, this determination is not their own but one foreign to them. The tree, the grass, is as natural existence, independent, and this adaptation of it to an end, such as making grass that which is to be eaten, does not concern the grass as grass, just as it does not concern the animal that man should clothe himself in his skin; Socrates may hence seem to miss in Anaxagoras this mode of looking at nature. But this to us familiar

way of regarding the good and expedient is on the one hand not the only one, and does not represent Plato's meaning, while, on the other, it is likewise necessary. We have not to represent the good or the end in so one-sided a manner that we think of it existing as such in the perceiving mind, and in opposition to what is; but set free from this form, we must take it in its essence as the Idea of all existence. The nature of things must be recognized in accordance with the Notion, which is the independent, unfettered consideration of things; and because it is that which things are in and for themselves, it controls the relationship of natural causes. This Notion is the end, the true cause, but that which recedes into itself; it is the implicitly existent first from which movement proceeds and which becomes result; it is not only an end present in the imagination before its actuality exists, but is also present in reality. Becoming is the movement through which a reality or totality becomes; in the animal or plant its essence as universal genus, is that which begins its movement and brings it forth. But this whole is not the product of something foreign, but its own product, what is already present as germ or seed; thus it is called end, the self-producing, that which in its Becoming is already implicitly existent. The Idea is not a particular thing, which might have another content than reality or appear quite different. The opposition is the merely formal opposition of possibility and actuality; the active impelling substance and the product are the same. This realization goes right through the opposition; the negative in the universal is just this process. The genus sets itself in a state of opposition as individual and universal, and thus, in what lives, the genus realizes itself in the opposition of races which are opposed, but whose principle is the universal genus. They, as individuals, aim at their own self-preservation as individuals in eating, drinking, &c., but what they thereby bring to pass is genus. Individuals sublate themselves, but genus is that

which is ever brought forth; plants bring forth only the same plants whose ground is the universal.

In accordance with this, the distinction between what have been badly named natural causes and the final causes has to be determined. Now if I isolate individuality and merely regard it as movement and the moments of the same, I show what are natural causes. For example, where has this life taken its origin? Through the generation of this its father and mother. What is the cause of these fruits? The tree whose juices so distil themselves that the fruit forthwith arises. Answers of this kind give the causes, *i.e.* the individuality opposed to an individuality; but their principle is the genus. Now nature cannot represent essence as such. The end of generation is the sublation of the individuality of Being; but nature which in existence certainly brings about this sublation of individuality, does not set the universal in its place, but another individual. Bones, muscles, &c., bring forth a movement; they are causes, but they themselves are so through other causes, and so on into infinitude. The universal, however, takes them up into itself as moments which undoubtedly appear in movement as causes, though the fundamental ground of these parts actually is the whole. It is not they which come first, but the result into which the juices of the plants, &c., pass, is the first, just as in origination it appears only as product, as seed, that which constitutes the beginning and the end, even though they be in different individuals. Their real nature is the same.

But such a genus is itself a particular genus and is essentially related to another, *e.g.* the Idea of the plant to that of the animal; the universal moves on. This looks like external teleology — that plants are eaten by animals, &c., in which their limitation as genus lies. The genus of the plant has the absolute totality of its realization in the animal, the animal in the conscious existence, just as the earth has it in the plant. This is the system of the whole in which each moment is transitory. The double method of considering the

matter thus is that each Idea is a circle within itself, the plant or the animal the Good of its kind; and, on the other hand, each is a moment in the universal Good. If I consider the animal merely as externally adapted to an end, as created for something else, I consider it in a one-sided way; it is real existence, in and for itself universal. But it is just as one-sided to say that the plant, for instance, is only in and for itself, only end to itself, only shut up within itself and going back into itself. For each idea is a circle which is complete in itself, but whose completion is likewise a passing into another circle; it is a vortex whose middle point, that into which it returns, is found directly in the periphery of a higher circle which swallows it up. Thus, for the first time, we reach the determination of an end in the world which is immanent within it.

These explanations are necessary here, since hereafter we see the speculative Idea coming more into the universal; it was formerly expressed as Being and the moments and movements were called existent. What has to be avoided in this transition is that we should thereby think that Being is given up and that we pass into consciousness as opposed to Being (in so doing the universal would lose all its speculative significance); the universal is immanent in nature. This is the meaning which is present when we represent to ourselves that thought constitutes, orders, &c., the world. It is not, so to speak, the activity of the individual consciousness, in which I stand here on one side and, opposite to me, an actuality, matter, which I form, dispose and order as I will; for the universal, Thought, must abide in Philosophy without this opposition. Being, pure Being, is universal when we thereby keep in mind that Being is absolute abstraction, pure thought; but Being as it is thus set forth as Being, has the significance of the opposite to this Being-reflected-into-itself, to thought and recollection; the universal, on the contrary, has reflection immediately in itself. So far, the ancients really got: it does not seem far. "Universal" is a dry determination;

everyone knows about the universal, but not of it as real existence. Thought, indeed, reaches to the invisibility of the sensuous; not to the positive determinateness of thinking it as universal, but only to the predicateless absolute as to the merely negative; and that is as far as the common ideas of the present day have come. With this discovery of thought we conclude the first Section and enter upon the second period. The profit to be derived from the first period is not very great. Some, indeed, think that there is still some special wisdom in it, but thought is still young, the determinations are thus still poor, abstract and arid. Thought here has but few determinations — water, Being, number, &c. — and these cannot endure; the universal must go forth on its own account as the self-determining activity, and this we find it doing in Anaxagoras alone.

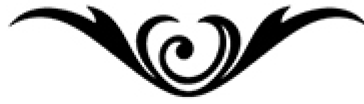
We have still to consider the relationship of the universal as opposed to Being, or consciousness as such in its relation to what is. By Anaxagoras' determination of real existence, this relationship of consciousness is also determined. In this regard nothing satisfactory can be found; for he recognized, on the one hand, thought as real existence, without, however, bringing this thought to bear on ordinary reality. Thus, on the other hand, this is destitute of thought and independent, an infinite number of homœomeriæ, *i.e.* an infinite amount of a sensuous implicit existence, which now, however, is sensuous Being; for existent Being is an accumulation of homœomeriæ. The relationship borne by consciousness to real existence may likewise be various. Anaxagoras could thus either say that the truth is only in thought and in rational knowledge, or that it is sensuous perception; for in this we have the homœomeriæ which are themselves implicit. Thus, in the first place, we find from him — as Sextus tells us, (adv. Math. VII., 89-91) "that the understanding (*λόγος*) is the criterion of the truth; the senses cannot judge of the truth on account of their weakness" — weakness for the homœomeriæ are the infinitely small; the

senses could not grasp them, do not know that they have to be something ideal and thought. A celebrated example of this is given by him according to Sextus (Pyrrh. Hyp. I. 13, §. 33), in the assertion that "the snow is black, for it is water, and water is black." He here asserts the truth in a reason. In the second place, according to Aristotle (Met. III. 7), Anaxagoras is said to have asserted that, "there is a medium between contradiction (*ἀντιφάσεως*); so that everything is untrue. For because the two sides of the opposition are mingled, what is mingled is neither good nor not good, and thus not true." Aristotle also quotes another time from him (Met. III. 5): "That one of his apothegms to his disciples was that to them things were as they supposed them." This may relate to the fact that because existent Being is an accumulation of homœomeriæ which are what really exists, sensuous perception takes things as they are in truth.

There is little more to be made of this. But here we have the beginning of a more distinct development of the relationship of consciousness to Being, the development of the nature of knowledge as a knowledge of the true. The mind has gone forth to express real existence as Thought; and thus real existence as existent, is in consciousness as such; it is implicit but likewise in consciousness. This Being is such only in so far as consciousness recognizes it, and real existence is only the knowledge of it. The mind has no longer to seek existence in something foreign, since it is in itself; for what formerly appeared foreign is Thought, *i.e.* consciousness has this real existence in itself. But this consciousness in opposition is an individual consciousness; thereby in fact, implicit Being is sublated, for the implicit is what is not opposed, not singled out, but universal. It is, indeed, known, but what is, only is in knowledge, or it is no other Being than that of the knowledge of consciousness. We see this development of the universal in which real existence goes right over to the side of consciousness, in the so

much decried worldly wisdom of the Sophists; we may view this as indicating that the negative nature of the universal is now developing.

CHAPTER II. First Period, Second Division: From the Sophists to the Socratics.



IN THIS SECOND division we have first to consider more particularly the Sophists, secondly Socrates, and thirdly the Socratics, while we distinguish from these Plato, and take him along with Aristotle in the third division. The *νοῦς*, which is at first only grasped in a very subjective manner as end, that is to say as that which is end to men, *i.e.* the Good, in Plato and Aristotle became understood in what is on the whole an objective way, as genus or Idea. Because thought has now become set forth as principle, and this at first presents a subjective appearance as being the subjective activity of thought, there now sets in (since the absolute is posited as subject) an age of subjective reflection; *i.e.* there begins in this period — which coincides with the disintegration of Greece in the Peloponnesian war — the principle of modern times.

Since in the *νοῦς* of Anaxagoras, as the still formal self-determining activity, determination is as yet quite undetermined, general and abstract, and along with that contentless throughout, the universal standpoint is the immediate necessity of going on to a content which begins actual determination. But what is this absolute, universal content which abstract thought as self-determining activity gives itself? That is the real question here. Consciousness now confronts the untrammeled thought of those ancient philosophers, whose general ideas we have considered. While hitherto the subject, when it reflected on the absolute, only produced thoughts, and had this content before it, it is now seen that what is here present is not the whole, but that the thinking subject likewise really belongs to the totality of the objective. Furthermore, this subjectivity of

thought has again the double character of at once being the infinite, self-relating form, which as this pure activity of the universal, receives content-determinations; and, on the other hand, as consciousness reflects that it is the thinking subject which is thus positing, of also being a return of spirit from objectivity into itself. Thus if thought, because it immersed itself in the object, had as such, and like the *νοῦς* of Anaxagoras, at first no content, because this stood on the other side, so now, with the return of thought as to the consciousness that the subject is what thinks, we have the other side — that what has to be dealt with is the attainment of a truly absolute content. This content, taken abstractly, may itself be again a double one. Either the "I" is in respect of determination the real when it makes itself and its interests the content, or the content becomes determined as the altogether universal. According to this, we have two questions to deal with, which are — how the determination of what is in and for itself is to be comprehended, and how this is likewise in immediate relation to the "I" as thinking. It comes to pass in Philosophy that although the "I" is the positing, yet the posited content of that which is thought is the object existent in and for itself. If one were to remain at saying that the "I" is that which posits, this would be the false idealism of modern times: in earlier times men did not remain at saying that what is thought is bad because I posit it.

To the Sophists the content is *mine*, and subjective: Socrates grasped the content which is in and for itself, and the followers of Socrates have, in direct connection with him, merely further defined this content.

A. — The Sophists.

THE NOTION, WHICH reason has found in Anaxagoras to be real existence, is the simple negative into which all determination, all that is existent and individual sinks. Before the Notion nothing can exist, for it is simply the predicateless absolute to which everything is clearly a moment only; for it there is thus nothing so to speak permanently fixed and sealed. The Notion is just the constant change of Heraclitus, the movement, the causticity, which nothing can resist. Thus the Notion which finds itself, finds itself as the absolute power before which everything vanishes; and thereby all things, all existence, everything held to be secure, is now made fleeting. This security — whether it be a security of natural Being or the security of definite conceptions, principles, customs and laws — becomes vacillation and loses its stability. As universal, such principles, &c., certainly themselves pertain to the Notion, yet their universality is only their form, for the content which they have, as determinate, falls into movement. We see this movement arising in the so-called Sophists whom we here encounter for the first time. They gave themselves the name *σοφισταί*, as teachers of wisdom, *i.e.* as those who could make wise (*σοφίζειν*). The learning of the Sophists is thus directly the opposite to ours, which only aspires to acquire information and investigate what is and has been — it is a mass of empirical matter, in which the discovery of a new form, a new worm, or other vermin is held to be a point of great importance. Our learned professors are in so far much less responsible than the Sophists; however, Philosophy has nothing to do with this lack of responsibility.

But as regards the relation of the Sophists to what is ordinarily believed, they are, by the healthy human understanding, as much decried as by

morality. By the former this is on account of their theoretic teaching, since it is senseless to say that nothing is; and in respect of practice because they subvert all principles and laws. For the first mentioned, things certainly cannot be left in this confusion of movement and in their negative aspect merely; yet the rest into which they pass is not the restoration of what is moved into its former condition of security, as if in the end the result were the same and the action were a superfluous one. Now the sophistry of common opinion, which is without the culture of thought and without scientific knowledge, is found in the fact that to it its determinations are, as such, held to be existent in and for themselves, and a number of rules of life, maxims, principles, &c., are considered as absolutely fixed truths. Mind itself is, however, the unity of these in many ways limited truths, which in it are all recognized as being present as sublated only, as merely relative truths, *i.e.* with their restrictions, in their limitation, and not as existent in themselves. Hence these truths to the ordinary understanding, are, in fact, no more, for on another occasion it allows and even asserts the opposite to have a value also for consciousness; or it does not know that it says directly the opposite to what it means, its expression being thus only an expression of contradiction. In its actions generally, and not in its bad actions, ordinary understanding breaks these its maxims and its principles itself, and if it leads a rational life, it is properly speaking only a standing inconsistency, the making good of one narrow maxim of conduct through breaking off from others. For example, a statesman of experience and culture is one who knows how to steer a middle course, and has practical understanding, *i.e.* deals with the whole extent of the case before him and not with one side of it, which expresses itself in one maxim only. On the other hand, he, whoever he is, who acts on one maxim, is a pedant and spoils things for himself and others. Most commonly it is thus. For example, we hear it said, “it is certain that the things that I see are; I believe

in their reality." Anyone can say this quite easily. But in fact it is not true that he believes in their reality; really he assumes the contrary. For he eats and drinks them, *i.e.* he is convinced that these things are not in themselves, and their being has no security, no subsistence. Thus common understanding is in its actions better than it thinks, for in action it is Mind as a whole. But it is not here known to itself as Mind, for what comes within its consciousness are definite laws, rules, general propositions, such as by its understanding are esteemed to be the absolute truth, whose limitation it, however, sets aside in action. Now, when the Notion turns to the riches which consciousness thinks to possess, and when the latter is sensible of the danger to its truth without which it would not be, when its fixed realities are destroyed, it is enraged; and the Notion which in this its realization applies itself to the common verities, draws hatred and disdain upon itself. This is the ground of the universal denunciation of the Sophists; a denunciation of healthy human understanding which does not know how else to help itself.

Sophistry is certainly a word of ill-repute, and indeed it is particularly through the opposition to Socrates and Plato that the Sophists have come into such disrepute that the word usually now signifies that, by false reasoning, some truth is either refuted and made dubious, or something false is proved and made plausible. We have to put this evil significance on one side and to forget it. On the other hand, we now wish to consider further from the positive and properly speaking scientific side, what was the position of the Sophists in Greece.

It was the Sophists who now applied the simple Notion as thought (which with Zeno in the Eleatic school had commenced to turn towards its pure counterpart, motion) to worldly objects generally, and with it penetrated all human relations. For it is conscious of itself as the absolute and single reality, and, jealous of all else, exercises its power and rule in this reality as regards all else, since this desires to be considered as the

determinate which is not Thought. The thought identical with itself, thus directs its negative powers towards the manifold determination of the theoretical and the practical, the truths of natural consciousness and the immediately recognized laws and principles; and what to the ordinary conception is established, dissolves itself in it, and in so doing leaves it to particular subjectivity to make itself first and fixed, to relate everything to itself.

Now that this Notion has appeared, it has become a more universal Philosophy, and not so much simple Philosophy as the universal culture of which every man who did not belong to those devoid of thought, partook, and necessarily partook. For we call culture just the Notion as applied in actuality, in so far as it makes its appearance not purely in its abstraction, but in unity with the manifold content of all ordinary conceptions. But in culture, the Notion is the predominant as also the actuating, because in both the determinate is recognized in its limits, in its transition into something else. This culture became the general aim of education, and there were hence a number of teachers of Sophistry. Indeed, the Sophists are the teachers of Greece through whom culture first came into existence in Greece, and thus they took the place of poets and of rhapsodists, who before this were the ordinary instructors. For religion was no instructress, since no teaching was in it imparted; and though priests certainly offered sacrifices, prophesied and interpreted the sayings of the oracle, instruction is something quite different from this. But the Sophists educated men in wisdom, in the sciences, music, mathematics, &c., and this was their foremost aim. Before Pericles appeared in Greece, the desire for culture through thought and through reflection was awakened; men wished to be cultured in their ideas, and in their various relations to guide themselves by thought, and no longer merely through oracles, or through custom, passion, the feelings of the moment. For the end of the State is the universal, under

which the particular is comprehended. Because the Sophists kept in view and enlarged upon this culture, they prosecuted teaching as a special calling, business, or profession, as an office taking the place of schools; they travelled round the towns of Greece, the youth of which was by them instructed.

Now culture is certainly an indefinite expression. It has, however, this meaning, that what free thought is to attain must come out of itself and be personal conviction; it is then no longer believed but investigated — in short, it is the so-called enlightenment of modern times. Thought seeks general principles by which it criticizes everything which is by us esteemed, and nothing has value to us which is not in conformity with these principles. Thus, thought undertakes to compare the positive content with itself, to dissolve the former concrete of belief; on one side to split the content up, and, on the other, to isolate these individualities, these particular points of view and aspects, and to secure them on their own account. These aspects, which are properly not independent, but only moments of a whole, when detached from it, relate themselves to themselves, and in this way assume the form of universality. Any one of them can thus be elevated to a reason, *i.e.* to a universal determination, which is again applied to particular aspects. Thus, in culture, it is requisite that men should be acquainted with the universal points of view which belong to a transaction, event, &c., that this point of view and thereby the thing, should be grasped in a universal way, in order to afford a present knowledge of what is in question. A judge knows the various laws, *i.e.* the various legal points of view under which a thing is to be considered; these are already for him universal aspects through which he has a universal consciousness, and considers the matter in a universal way. A man of culture thus knows how to say something of everything, to find points of view in all. Greece has to thank the Sophists for this culture, because they taught men to exercise thought as to what

should have authority for them, and thus their culture was culture in philosophy as much as in eloquence.

In order to reach this double end, the Sophists were one in their desire to be wise. To know what constitutes power amongst men and in the State, and what I have to recognize as such, is counted as wisdom; and because I know the power, I also know how to direct others in conformity with my end. Hence the admiration that Pericles and other statesmen excited, just because they knew their own standpoint, and had the power of putting others in their proper place. That man is powerful who can deduce the actions of men from the absolute ends which move them. The object of the Sophists has thus been to teach what is the mainspring of the world, and since Philosophy alone knows that this is the universal thought which resolves all that is particular, the Sophists were also speculative philosophers. Learned in the proper sense they hence were not, because there were as yet no positive sciences without Philosophy, such as in their aridity did not concern all mankind and man's essential aspects.

They further had the most ordinary practical end, to give a consciousness of that which is involved in the moral world and which satisfies man. Religion taught that the gods are the powers which rule over men. Immediate morality recognized the rule of laws; man was to find satisfaction in conforming to laws, and was to assume that others also find satisfaction because they follow these laws. But from the reflection which here breaks in, it no longer satisfies man to obey law as an authority and external necessity, for he desires to satisfy himself in himself, to convince himself, through his reflection, of what is binding upon him, what is his end and what he has to do for this end. Thus the impulses and desires that man has, become his power; and only inasmuch as he affords them satisfaction does he become satisfied. Now the Sophists taught how these powers could be moved in empirical man, for the good as ordinarily recognized, no longer

determined them. Rhetoric, however, teaches how circumstances may be made subject to such forces; it even makes use of the wrath and passions of the hearer in order to bring about a conclusion. Thus the Sophists were more especially the teachers of oratory, and that is the aspect in which the individual could make himself esteemed amongst the people as well as carry out what was best for the people; this certainly characterizes a democratic constitution, in which the citizens have the ultimate decision. Because, in this way, oratory was one of the first requirements for the rule of a people, or for making something clear to them through their ordinary ideas, the Sophists trained men for common Greek life, for citizenship and for statesmen, without appearing to prepare State officials for an examination in specific subjects. For the particular characteristic of eloquence is to show the manifold points of view existing in a thing, and to give force to those which harmonize with what appears to me to be most useful; it thus is the art of putting forward various points of view in the concrete case, and placing others rather in the shade. Aristotle's *Topica* comes to mind in the connection, inasmuch as it gives the categories or thought-determinations (*τόπους*), according to which we have to regard things in order to learn to speak; but the Sophists were the first to apply themselves to a knowledge of these.

This is the position taken up by the Sophists. But we find a perfectly definite picture of their further progress and procedure in Plato's Protagoras. Plato here makes Protagoras express himself more precisely respecting the art of the Sophists. That is to say, Plato in this dialogue represents that Socrates accompanies a young man named Hippocrates, who desires to place himself under Protagoras, then newly arrived in Athens, for instruction in the science of the Sophists. On the way, Socrates now asks Hippocrates what is this wisdom of the Sophists which he wishes to learn. Hippocrates at first replies Rhetoric, for the Sophist is one who knows how

to make men clever (*δεινόν*) in speech. In fact, what is most striking in a man or people of culture is the art of speaking well, or of turning subjects round and considering them in many aspects. The uncultivated man finds it unpleasant to associate with people who know how to grasp and express every point of view with ease. The French are good speakers in this sense, and the Germans call their talking prattle; but it is not mere talk that brings about this result, for culture is also wanted. We may have mastered a speech quite completely, but if we have not culture, it is not good speaking. Men thus learn French, not only to be able to speak French well, but to acquire French culture. What is to be obtained from the Sophists is thus the power of keeping the manifold points of view present to the mind, so that the wealth of categories by which an object may be considered, immediately occurs to it. Socrates, indeed, remarks that the principle of the Sophists is not hereby determined in a sufficiently comprehensive way, and thus it is not sufficiently known what a Sophist is, "yet," he says, "we have a desire to go on."[86] For likewise, if anyone wishes to study Philosophy, he does not as yet know what Philosophy is, else he would not need to study it.

Having reached Protagoras with Hippocrates, Socrates finds him in an assemblage of the foremost Sophists and surrounded by listeners, "walking about and like an Orpheus entrancing all men by his words, Hippias sitting meanwhile on a chair with not so many round him, and Prodicus lying amongst a great number of admirers." After Socrates brought before Protagoras the request to have Hippocrates placed under his instruction, in order that he might by him be taught how to become eminent in the State, he also asks whether they might speak with him in public or alone. Protagoras praises his discretion, and replies that they act wisely to make use of this precaution. For because the Sophists wandered about the towns, and thus youths, deserting fathers and friends, followed them in view of improving themselves through their intercourse with them, they drew upon

themselves much envy and ill-will — for everything new is hated. On this point Protagoras speaks at length: "I assert that the art of the Sophists is old; but that those of the ancients who practised it in fear of giving offence" (for the uncultured world is antagonistic to the cultured) "veiled and concealed it. One section, like Homer and Hesiod, taught it in their poetry; others, like Orpheus and Musæus, through mysteries and oracles. Some, I believe, like Iccus of Tarentum, and the Sophist now living and unsurpassed — Herodicus, of Selymbria — in gymnastics, but many more through music." We see that Protagoras usually describes the end of mental culture as being to bring about morality, presence of mind, sense of order and general capacity. He adds: "all those who feared envy arising against the sciences, required such veils and screens. But I think that they do not attain their end, for men of penetration in the State see the end appearing through, while the people notice nothing, and only quote the others. If people behave so, they make themselves more hated, and appear to be impostors. I have therefore taken the opposite way, and openly acknowledge (*ὁμολογῶ*), and do not deny that I am a Sophist" (Protagoras first used the name of Sophist), "and that my business is to give men culture (*παιδεύειν*)."[87]

Further on, where the arts which Hippocrates was to acquire under Protagoras' instruction were discussed, Protagoras answered Socrates: "What you ask is sensible, and I like to answer a sensible question. Hippocrates will not have the same experience that he would have with other teachers (*σοφιστῶν*). These latter are at variance with (*λωβῶνται*) their pupils, for they take them against their wills straight back to the arts and sciences which they just wished to escape, inasmuch as they teach them arithmetic, geometry and music. But he who comes to me will be instructed in nothing else than that in which he comes to be instructed." Thus the youths came freely, with the wish to be made men of culture through his instruction, and in the hope that he, as teacher, knew the way to succeed in

so doing. As to his general aim, Protagoras says, “The instruction consists in bringing about a right perception and understanding (*εὐβουλία*) of the best way of regulating one’s own family affairs, and similarly as regards citizenship, in qualifying men both to speak on the affairs of the State, and to do the best for the State.” Thus two interests are here apparent, that of the individual and that of the State. Now Socrates expresses dissent and surprise at Protagoras’ assertion as to imparting instruction in political aptitude. “I thought that the political virtues could not be learned,” for it is Socrates’ main tenet that virtue cannot be taught. And Socrates now brings forward the following argument, after the manner of the Sophists appealing to experience. “Those who are masters of the art of politics cannot impart that art to others. Pericles, the father of these youths, gave them instruction in all that instructors could teach; but not in the science for which he is celebrated; here he left them free to wander in the chance of their lighting upon wisdom. Similarly other great statesmen did not teach it to others, whether friends or strangers.”[88]

Protagoras now replied that it could be taught, and shows the reason why great statesmen did not give this instruction, while he asks whether he is to speak as an elder to younger men in a myth, or whether he should give his reasons. The company left the matter to him and he began with the following myth of everlasting interest: “The gods commanded Prometheus and Epimetheus to adorn the world and confer on it its qualities and powers. Epimetheus imparted strength, power of flight, arms, clothing, herbs and fruits, but in some incomprehensible way he gave all to the beasts, so that nothing remained to men. Prometheus saw them unclothed, unarmed, helpless, when the moment came in which the form of man had to go forth into the light. Then he stole fire from heaven, the arts of Vulcan and Minerva, to equip man for his needs. But political wisdom was wanting, and, living without any common bond, they were in a constant state of strife

and misery. Then Zeus gave the command to Hermes to grant reverence" (natural obedience, honour, docility, respect of children for parents, and of men for higher and better natures), "and justice. Hermes asks, 'How shall I impart them? To individuals, as particular arts are distributed, just as some have a knowledge of medicine sufficient for assisting others?' But Zeus answers that it must be to all, for no body of men (*πόλις*) can exist if only a few partake of those qualities. And it shall be the law that whoever cannot acknowledge authority and justice must be exterminated as a plague to the State. Hence the Athenians when they wish to build, call builders into counsel, and when they contemplate any other business, those who have experience in it, but when they wish to come to a decision or make a regulation in State affairs, they admit all. For all must partake of this virtue or no State could exist. Thus if anyone is inexperienced in the art of flute-playing and yet professes to be a master in it, he is justly thought to be mad. But in justice it is otherwise; if anyone is not just and confesses it, he is thought to be mad. He must profess to be so, for everybody must either share in it or be shut out from social life."[89]

For the fact that this political science is also so constituted "that everyone by education and diligence (*ἐξ ἐπιμελείας*) may acquire it," Protagoras gives additional reasons in the following argument: "No one blames or punishes on account of a defect or evil that has come to anyone by nature or by chance. But defects and faults which can be removed through diligence, exercise and teaching are considered to be blameworthy and punishable. Impiety and injustice are of this description and, generally speaking, all that opposes public virtue. Men guilty of these sins are thus reproached; they are punished in the idea that they had the power to remove the wrong and still more to acquire political virtue through diligence and teaching. Thus men do not punish on account of what is past — excepting as we strike a vicious beast on the head — but on account of what is to

come, so that neither the one who committed the crime nor any other misled by his example, should do the same again. Thus it is in this implied that virtue can be acquired through education and exercise.”[90] This is a good argument for the teachability of virtue.

As to the statement of Socrates that men such as Pericles, who were famed for their political virtues, did not impart these to their children and friends, Protagoras in the first place says that it may on the other hand be replied, that in these virtues all men are instructed by all men. Political virtue is so constituted that it is the common province of all; this one essential for all men is justice, temperance, and holiness — in one word, whatever comprises manly virtue. In it no particular education from men of eminence is thus required. The children are from their earliest infancy exhorted and admonished to do what is good, and are accustomed to that which is right. Instruction in music and gymnastics contributes to temper the indulgence of self-will and pleasure, and to accustom men to conform to a law or rule; and the reading of the poets who enforce this does the same. When man steps outside this circle of education, he enters into that of the constitution of a State which likewise contributes to keep everyone within the bounds of law and order, so that political virtue is a result of the education of youth. But the objection that distinguished men did not impart their distinction to their children and friends, Protagoras answered secondly and very well as follows: “Let us say that in a State all the citizens had to become flute-players, all would be instructed in the art; some would be distinguished, many good, some mediocre, a few perhaps bad, and yet all would have a certain amount of skill. But it might very well be the case that the son of an artist should be a bad player, for the distinction depends on particular talents, and a particularly good natural capacity. From very skilful players very unskilful might descend, and conversely, but all would have a certain knowledge of the flute, and all would certainly be infinitely better

than those who were quite ignorant of the art. Similarly all, even the worst citizens of a rational State are better and juster than citizens of a State where there is no culture nor justice nor law, in a word, where there is no necessity to bring them up to be just. For this superiority they have to thank the education given in their State."[91] All these are quite good examples and striking arguments which are not at all worse than Cicero's reasoning — *a natura insitum*. The arguments of Socrates and the development of these arguments are, on the contrary, examples based upon experience, and are often not better than what is here placed in the mouth of a Sophist.

What now confronts us is the question of how far this may be inadequate, and particularly how far Socrates and Plato came into collision with the Sophists and constituted the antagonism to them. For the claim made by the Sophists in Greece was that they had given a higher culture to their people; for this, indeed, great credit was ascribed to them in Greece, but they were met by the reproach that was encountered by all culture. That is to say, because the Sophists were masters of argument and reasoning, and were within the stage of reflective thought, they wished, passing from the particular to the universal, to awaken attention through examples and illustrations to what in his experience and to his mind appears to man to be right. This, the necessary course of free, thinking reflection, which with us has also been adopted by culture, must, however, necessarily lead beyond implicit trust and unrestricted faith in the current morality and religion. The statement that the Sophists thereby fell into one-sided principles rests upon the fact that in Greek culture the time had not yet come when, out of thinking consciousness itself, the ultimate principles had become manifested, and thus there was something firm to rest upon, as is the case with us in modern times. Because, on the one hand, the need of subjective freedom existed merely to give effect to that which man himself perceives and finds present in his reason (thus laws, religious ideas, only in so far as I

recognize them through my thought), on the other hand, no fixed principle had so far been found in thought; thought was rather reasoning, and what remained indeterminate could thus only be fulfilled through self-will. It is otherwise in our European world where culture is, so to speak, introduced under the protection and in presupposition of a spiritual religion, *i.e.* not of a religion of the imagination, but by presupposing a knowledge of the eternal nature of Spirit and of the absolute end, of the end of man, to be in a spiritual way actual and to posit himself in unity with the absolute spirit. Thus here there is a groundwork of a fixed spiritual principle which thus satisfies the needs of the subjective mind; and from this absolute principle all further relationships, duties, laws, &c., are established. Consequently culture cannot receive the variety of direction — and hence the aimlessness — of the Greeks and of those who extended culture over Greece, the Sophists. As regards the religion of the imagination, as regards the undeveloped principle of the Greek State, culture was able to divide itself into many points of view, or it was easy to it to represent particular subordinate points of view as highest principles. Where, on the contrary, as is the case with us, a universal aim so high, indeed the highest possible, floats before the imagination, a particular principle cannot so easily reach this rank, even if the reflection of reason attains to the position of determining and recognizing from itself what is highest; for the subordination of special principles is already determined, although in form our enlightenment may have the same standpoint as that of the Sophists.

As regards content, the standpoint of the Sophists differed from that of Socrates and Plato, in that the mission of Socrates was to express the beautiful, good, true, and right, as the end and aim of the individual, while with the Sophists the content was not present as an ultimate end, so that all this was left to the individual will. Hence came the evil reputation obtained by the Sophists through the antagonism of Plato, and this is certainly their

defect. As to their outward lives, we know that the Sophists accumulated great riches;[92] they became very proud, and some of them lived very luxuriously. But in respect of the inward life, reasoning thought has, in distinction to Plato, this prevailing characteristic, that it makes duty, that which has to be done, not come from the Notion of the thing as determined in and for itself; for it brings forward external reasons through which right and wrong, utility and harmfulness, are distinguished. To Plato and Socrates, on the other hand, the main point is that the nature of the conditions should be considered, and that the Notion of the thing in and for itself should become evolved. Socrates and Plato wished to bring forward this Notion as opposed to the consideration of things from points of view and reasonings which are always merely particular and individual, and thus opposed to the Notion itself. The distinction in the two points of view is thus that cultured reasoning only belongs, in a general way, to the Sophists, while Socrates and Plato determined thought through a universal determination (the Platonic Idea), or something fixed, which mind finds eternally in itself.

If sophistry is bad in the sense that it signifies a quality of which only bad men are guilty, it is at the same time much more common than this would imply; for all argumentative reasoning, adducing of arguments and counterarguments, bringing into prominence particular points of view, is sophistry. And just as utterances of the Sophists are adduced against which nothing can be said (as they are by Plato), men of our day are urged to all that is good for the very reasons that are reasons to the Sophists. Thus it is said, “do not cheat, else you lose your credit, hence your wealth,” or, “be temperate, or you will spoil your appetite and have to suffer.” Or for punishment men give the external reasons of improvement, &c.; or else an action is defended on external grounds taken from the result. If, on the other hand, firmly rooted principles lie at the foundation — as in the Christian

Religion, although men now remember this no longer — it is said, “the grace of God in respect of holiness, &c., thus directs the life of men;” and these external grounds fall away. Sophistry thus does not lie so far from us as we think. When educated men discuss matters now-a-days, it may seem all very good, but it is in no way different from what Socrates and Plato called sophistry — although they themselves have adopted this standpoint as truly as did the Sophists. Educated men fall into it when they judge of concrete cases in which a particular point of view determines the result, and we must in ordinary life do the same if we wish to make up our minds in action. If duties and virtues are advocated as in sermons (this is so in most sermons), we must hear such reasons given. Other speakers, such as those in parliament, likewise make use of arguments and counterarguments similar to these, through which they try to persuade and convince. On the one hand something definite is in question, such as the constitution, or a war, and from the fixed direction thus given, certain provisions have to be deduced consistently; but this consistency, on the other, soon disappears, just because the matter can be arranged either this way or that, and thus particular points of view always are decisive. Men likewise make use of good arguments, after the manner of the Sophists, against Philosophy. There are, they say, various philosophies, various opinions, and this is contrary to the one Truth; the weakness of human reason allows of no knowledge. What is Philosophy to the feelings, mind, and heart? Abstract thinking about such matters produces abstruse results which are of no use in the practical life of man. We no longer apply the word sophistry thus, but it is the way of the Sophists not to take things as they are, but to bring about their proofs by arguments derived from feelings as ultimate ends. We shall see this characteristic of the Sophists more clearly still in Socrates and Plato.

With such reasoning men can easily get so far as to know (where they do not, it is owing to the want of education — but the Sophists were very well educated) that if arguments are relied upon, everything can be proved by argument, and arguments for and against can be found for everything; as particular, however, they throw no light upon the universal, the Notion. Thus what has been considered the sin of the Sophists is that they taught men to deduce any conclusion required by others or by themselves; but that is not due to any special quality in the Sophists, but to reflective reasoning. In the worst action there exists a point of view which is essentially real; if this is brought to the front, men excuse and vindicate the action. In the crime of desertion in time of war, there is, for example, the duty of self-preservation. Similarly in more modern times the greatest crimes, assassination, treachery, &c., have been justified, because in the purpose there lay a determination which was actually essential, such as that men must resist the evil and promote the good. The educated man knows how to regard everything from the point of view of the good, to maintain in everything a real point of view. A man does not require to make great progress in his education to have good reasons ready for the worst action; all that has happened in the world since the time of Adam has been justified by some good reason.

It appears that the Sophists were conscious of this reasoning, and knew, as educated men, that everything could be proved. Hence in Plato's Gorgias it is said that the art of the Sophists is a greater gift than any other; they could convince the people, the senate, the judges, of what they liked.[93] The advocate has similarly to inquire what arguments there are in favour of the party which claims his help, even if it be the opposite one to that which he wished to support. That knowledge is no defect, but is part of the higher culture of the Sophists; and if uneducated men naturally form conclusions from external grounds which are those alone coming to their knowledge,

they may perhaps be mainly determined by something besides what they know (by their integrity, for instance). The Sophists thus knew that on this basis nothing was secure, because the power of thought treated everything dialectically. That is the formal culture which they had and imparted, for their acquaintanceship with so many points of view shook what was morality in Greece (the religion, duties, and laws, unconsciously exercised), since through its limited content, that came into collision with what was different. Once it was highest and ultimate, then it was deposed. Ordinary knowledge thus becomes confused, as we shall see very clearly in Socrates, for something is held to be certain to consciousness, and then other points of view which are also present and recognized, have similarly to be allowed; hence the first has no further value, or at least loses its supremacy. We saw in the same way, how bravery, which lies in the hazarding of one's life, is made dubious by the duty of preserving life, if put forward unconditionally. Plato quotes several examples of this unsettling tendency, as when he makes Dionysodorus maintain: "Whoever gives culture to one who does not possess knowledge, desires that he should no longer remain what he is. He desires to direct him to reason, and this is to make him not the same as he is." And Euthydemus, when the others say that he lies, answers, "Who lies, says what is not; men cannot say what is not, and thus no one can lie."[94] And again Dionysodorus says, "You have a dog, this dog has young, and is a father; thus a dog is your father, and you are brother to its young."[95] Sequences put together thus are constantly found in critical treatises.

With this comes the question which the nature of thought brings along with it. If the field of argument, that which consciousness holds to be firmly established, is shaken by reflection, what is man now to take as his ultimate basis? For something fixed there must be. This is either the good, the universal, or the individuality, the arbitrary will of the subject; and both

may be united, as is shown later on in Socrates. To the Sophists the satisfaction of the individual himself was now made ultimate, and since they made everything uncertain, the fixed point was in the assertion, “it is my desire, my pride, glory, and honour, particular subjectivity, which I make my end.” Thus the Sophists are reproached for countenancing personal affections, private interests, &c. This proceeds directly from the nature of their culture, which, because it places ready various points of view, makes it depend on the pleasure of the subject alone which shall prevail, that is, if fixed principles do not determine. Here the danger lies. This takes place also in the present day where the right and the true in our actions is made to depend on good intention and on my own conviction. The real end of the State, the best administration and constitution, is likewise to demagogues very vague.

On account of their formal culture, the Sophists have a place in Philosophy; on account of their reflection they have not. They are associated with Philosophy in that they do not remain at concrete reasoning, but go on, at least in part, to ultimate determinations. A chief part of their culture was the generalization of the Eleatic mode of thought and its extension to the whole content of knowledge and of action; the positive thus comes in as, and has become, utility. To go into particulars respecting the Sophists would lead us too far; individual Sophists have their place in the general history of culture. The celebrated Sophists are very numerous; the most celebrated amongst them are Protagoras, Gorgias, and also Prodicus, the teacher of Socrates, to whom Socrates ascribes the well-known myth of “The choice of Hercules”[96] — an allegory, beautiful in its own way, which has been repeated hundreds and thousands of times. I will deal only with Protagoras and Gorgias, not from the point of view of culture, but in respect of proving further how the general knowledge which they extended to everything, has, with one of them, the universal form which makes it pure

science. Plato is the chief source of our acquaintanceship with the Sophists, for he occupied himself largely with them; then we have Aristotle's own little treatise on Gorgias; and Sextus Empiricus, who preserved for us much of the philosophy of Protagoras.

1. Protagoras.

Protagoras, born at Abdera,[97] was somewhat older than Socrates; little more is known of him, nor, indeed, could there be much known. For he led a uniform life, since he spent it in the study of the sciences; he appeared in Greece proper as the first public teacher. He read his writings[98] like the rhapsodists and poets, the former of whom sang the verses of others, and the latter their own. There were then no places of learning, no books from which men could be taught, for to the ancients, as Plato says,[99] "the chief part of culture" (*ραιδείας*) "consisted in being skilled" (*δεινόν*) "in poetry," just as with us fifty years ago the principal instruction of the people consisted of Bible History and Biblical precepts. The Sophists now gave, in place of a knowledge of the poets, an acquaintanceship with thought. Protagoras also came to Athens and there lived for long, principally with the great Pericles, who also entered into this culture. Indeed, the two once argued for a whole day as to whether the dart or the thrower or he who arranged the contest was guilty of the death of a man who thus met his death.[100] The dispute is over the great and important question of the possibility of imputation; guilt is a general expression, the analysis of which may undoubtedly become a difficult and extensive undertaking. In his intercourse with such men, Pericles developed his genius for eloquence; for whatever kind of mental occupation may be in question, a cultivated mind can alone excel in it; and true culture is only possible through pure science. Pericles was a powerful orator, and we see from Thucydides how deep a knowledge he had of the State and of his people. Protagoras had the same

fate as Anaxagoras, in being afterwards banished from Athens. The cause of this sentence was a work written by him beginning, “As to the gods, I am not able to say whether they are or are not; for there is much which prevents this knowledge, both in the obscurity of the matter, and in the life of man which is so short.” This book was also publicly burned in Athens by command of the State, and, so far as we know, it was the first to be treated so. At the age of seventy or ninety years Protagoras was drowned while on a voyage to Sicily.[101]

Protagoras was not, like other Sophists, merely a teacher of culture, but likewise a deep and solid thinker, a philosopher who reflected on fundamental determinations of an altogether universal kind. The main point in his system of knowledge he expressed thus: “Man is the measure of all things; of that which is, that it is; of that which is not, that it is not.”[102] On the one hand, therefore, what had to be done was to grasp thought as determined and as having content; but, on the other, to find the determining and content-giving; this universal determination then becomes the standard by which everything is judged. Now Protagoras’ assertion is in its real meaning a great truth, but at the same time it has a certain ambiguity, in that as man is the undetermined and many-sided, either he may in his individual particularity, as this contingent man, be the measure, or else self-conscious reason in man, man in his rational nature and his universal substantiality, is the absolute measure. If the statement is taken in the former sense, all is self-seeking, all self-interest, the subject with his interests forms the central point; and if man has a rational side, reason is still something subjective, it is “he.” But this is just the wrong and perverted way of looking at things which necessarily forms the main reproach made against the Sophists — that they put forward man in his contingent aims as determining; thus with them the interest of the subject in its particularity, and the interest of the same in its substantial reason are not distinguished.

The same statement is brought forward in Socrates and Plato, but with the further modification that here man, in that he is thinking and gives himself a universal content, is the measure. Thus here the great proposition is enunciated on which, from this time forward, everything turns, since the further progress of Philosophy only explains it further: it signifies that reason is the end of all things. This proposition further expresses a very remarkable change of position in asserting that all content, everything objective, is only in relation to consciousness; thought is thus in all truth expressed as the essential moment, and thereby the Absolute takes the form of the thinking subjectivity which comes before us principally in Socrates. Since man, as subject, is the measure of everything, the existent is not alone, but is for my knowledge. Consciousness is really the producer of the content in what is objective, and subjective thinking is thus really active. And this view extends even to the most modern philosophy, as when, for instance, Kant says that we only know phenomena, *i.e.* that what seems to us to be objective reality, is only to be considered in its relation to consciousness, and does not exist without this relation. The fact that the subject as active and determining brings forth the content, is the important matter, but now the question comes as to how the content is further determined — whether it is limited to the particularity of consciousness or is determined as the universal, the existent in and for itself. God, the Platonic Good, is certainly at first a product of thought, but in the second place He is just as really in and for Himself. Since I, as existent, fixed and eternal, only recognize what is in its content universal, this, posited as it is by me, is likewise the implicitly objective, not posited by me.

Protagoras himself shows us much more of what is implied in his theory, for he says, “Truth is a manifestation for consciousness. Nothing is in and for itself one, but everything has a relative truth only,” *i.e.* it is what it is but for another, which is man. This relativity is by Protagoras expressed in a

way which seems to us in some measure trivial, and belongs to the first beginnings of reflective thought. The insignificant examples which he adduces (like Plato and Socrates when they follow out in them the point of view of reflection), by way of explanation, show that in Protagoras' understanding what is determined is not grasped as the universal and identical with self. Hence the exemplifications are taken mostly from sensuous manifestation. "In a wind it may be that one person is cold and another is not; hence of this wind we cannot tell whether in itself it is cold or hot."[103] Frost and heat are thus not anything which exist, but only are in their relation to a subject; were the wind cold in itself, it would always be so to the subject. Or again, "if we have here six dice, and place by them four others, we should say of the former that there are more of them. But, again, if we put twelve by them we say that these first six are the fewer."[104] Because we say of the same number that it is more and fewer, the more and the less is merely a relative determination; thus what is the object, is so in the idea present to consciousness only. Plato, on the contrary, considered one and many, not like the Sophists in their distinction, but as being one and the same.

Plato says further on this point, that the white, warm, &c., or everything that we say of things, does not exist for itself, but that the eye, sensation, is necessary to make it for us. This reciprocal movement is what first creates the white, and in it the white is not a thing in itself, but what we have present is a seeing eye, or, to speak generally, sight, and particularly the seeing of white, the feeling of warmth, &c. Undoubtedly warmth, colour, &c., really are only in relation to another, but the conceiving mind divides itself into itself and into a world in which each also has its relation. This objective relativity is expressed better in the following way. If the white were in itself, it would be that which brought forth the sensation of it; it would be the action or the cause, and we, on the contrary, the passive and

receptive. But the object which thus requires to be active, is not active until it enters into (*ξυνέλθῃ*) relation with the passive; similarly the passive is only in relation to the active. Thus what is said in defining anything never concerns the thing as in itself, but clearly only as being related to something else. Nothing is thus constituted in and for itself as it appears, but the truth is just this phenomenon to which our activity contributes. As things appear to the healthy man they are thus not in themselves, but for him; as they appear to the sick or deranged man, they are to him, without our being able to say that as they appear to him, they are not true.[105] We feel the awkwardness of calling any such thing true, for after all the existent, if related to consciousness, is yet not related to it as fixed, but to sensuous knowledge; and then this consciousness itself is a condition, *i.e.* something which passes away. Protagoras rightly recognized this double relativity when he says, "Matter is a pure flux, it is not anything fixed and determined in itself, for it can be everything, and it is different to different ages and to the various conditions of waking and sleep, &c."[106] Kant separates himself from this standpoint only in that he places the relativity in the "I," and not in objective existence. The phenomenon is, according to him, nothing but the fact of there being outside an impulse, an unknown *x*, which first receives these determinations through our feeling. Even if there were an objective ground for our calling one thing cold and another warm, we could indeed say that they must have diversity in themselves, but warmth and cold first become what they are in our feeling. Similarly it can only be in our conception that things are outside of us, etc. But if the experience is quite correctly called a "phenomenon," *i.e.* something relative, because it does not come to pass without the determinations of the activity of our senses, nor without categories of thought, yet that one, all-pervading, universal, which permeates all experience, which to Heraclitus was necessity, has to be brought into consciousness.

We see that Protagoras possesses great powers of reflective thought, and indeed reflection on consciousness came to consciousness with Protagoras. But this is the form of manifestation which was again taken by the later sceptics. The phenomenal is not sensuous Being, for because I posit this as phenomenal, I assert its nullity. But the statements "What is, is only for consciousness," or "The truth of all things is the manifestation of them in and for consciousness," seem quite to contradict themselves. For it appears as though a contradiction were asserted — first that nothing is in itself as it appears, and then that it is true as it appears. But objective significance must not be given to the positive, to what is true, as if, for example, this were white in itself because it appears so; for it is only this manifestation of the white that is true, the manifestation being just this movement of the self-abrogating sensuous Being, which, taken in the universal, stands above consciousness as truly as above Being. The world is consequently not only phenomenal in that it is for consciousness, and thus that its Being is only one relative to consciousness, for it is likewise in itself phenomenal. The element of consciousness which Protagoras has demonstrated, and owing to which the developed universal has in it the moment of the negative Being-for-another, has thus indeed to be asserted as a necessary moment; but taken for itself, alone and isolated, it is one-sided, since the moment of implicit Being is likewise essential.

2. Gorgias.

This scepticism reached a much deeper point in Gorgias of Leontium in Sicily, a man of great culture, and also distinguished as a statesman. During the Peloponnesian war he was, in Ol. 88, 2 (427 B.C.), a few years after Pericles' death in Ol. 87, 4, sent from his native town to Athens.[107] And when he attained his object, he went through many other Greek towns, such as Larissa in Thessaly, and taught in them. Thus he obtained great wealth,

along with much admiration, and this lasted till his death at over a hundred years of age.

He is said to have been a disciple of Empedocles, but he also knew the Eleatics, and his dialectic partakes of the manner and method of the latter; indeed Aristotle, who preserves this dialectic, in the work *De Xenophane, Zenone et Gorgia*, which has indeed only come to us in fragments, deals with them together. Sextus Empiricus also gives us in full the dialectic of Gorgias. He was strong in the dialectic requisite for eloquence, but his preeminence lies in his pure dialectic respecting the quite universal categories of Being and non-being, which indeed is not like that of the Sophists. Tiedemann (Geist. der Spec. Phil. vol. I. p. 362) says very falsely: "Gorgias went much further than any man of healthy mind could go." Tiedemann could say of every philosopher that he went further than healthy human understanding, for what men call healthy understanding is not Philosophy, and is often far from healthy. Healthy human understanding possesses the modes of thought, maxims, and judgments of its time, the thought-determinations of which dominate it without its being conscious thereof. In this way Gorgias undoubtedly went further than healthy understanding. Before Copernicus it would have been contrary to all healthy human understanding if anyone had said that the earth went round the sun, or before the discovery of America, if it were said that there was a continent there. In India or in China a republic would even now be contrary to all healthy understanding. The dialectic of Gorgias moves more purely in Notion than that found in Protagoras. Since Protagoras asserted the relativity, or the non-implicit nature of all that is, this only exists in relation to another which really is essential to it; and this last, indeed, is consciousness. Gorgias' demonstration of the non-implicitness of Being is purer, because he takes in itself what passes for real existence without

presupposing that other, and thus shows its own essential nullity and separates therefrom the subjective side and Being as it is for the latter.

Gorgias' treatise "On Nature," in which he composes his dialectic, falls, according to Sextus Empiricus (adv. Math. VII. 65), into three parts. "In the first he proves that" (objectively) "nothing exists, in the second" (subjectively), "that assuming that Being is, it cannot be known; and in the third place" (both subjectively and objectively), "that were it to exist and be knowable, no communication of what is known would be possible." Gorgias was a congenial subject to Sextus, but the former still proved, and this is what the Sceptics ceased to do. Here very abstract thought-determinations regarding the most speculative moments of Being and non-being, of knowledge, and of bringing into existence, of communicating knowledge, are involved; and this is no idle talk, as was formerly supposed, for Gorgias' dialectic is of a quite objective kind, and is most interesting in content.

a. "If anything is," (this "anything" is, however, a makeshift that we are in the habit of using in our conversation, and which is, properly speaking, inappropriate, for it implies an opposition of subject and predicate, while at present the "is" alone is in question) — then "if it *is*" (and now it becomes for the first time defined as subject) "it is either the existent or the non-existent, or else existence and non-existence. It is now evident of these three that they are not."[108]

α. "That which is not, is not; for if Being belonged to it, there would at the same time be existence and non-existence. That is, in so far as it is thought of as non-existent, it is not; but in so far as it *is* the non-existent, it must exist. But it cannot at the same time be and not be. Again, if the non-existent is, the existent is not, for the two are opposed. Thus, if Being pertained to non-being, non-being would belong to Being. But if Being does

not exist, no more does non-being."[109] This is with Gorgias a characteristic mode of reasoning.[110]

β. "But in proving," Aristotle adds to the passages just quoted, "that the existent is not, he follows Melissus and Zeno." This is the dialectic already brought forward by them. "If Being is, it is contradictory to predicate a quality to it, and if we do this, we express something merely negative about it."

αα. For Gorgias says: "What is, either is in itself (*ἀΐδιον*) being without beginning, or it has originated," and he now shows that it could neither be the one nor the other, for each leads to contradiction. "It cannot be the former, for what is in itself has no beginning, and is the infinite," and hence likewise undetermined and indeterminable. "The infinite is nowhere, for if it is anywhere, that in which it is, is different from it." Where it is, it is in another, "but that is not infinite which is different from another, and contained in another. Just as little is it contained in itself, for then that in which it is, and that which is therein, would be the same. What it is in, is the place; that which is in this, is the body; but that both should be the same is absurd. The infinite does not thus exist."[111] This dialectic of Gorgias regarding the infinite is on the one hand limited, because immediate existence has certainly no beginning and no limit, but asserts a progression into infinitude; the self-existent Thought, the universal Notion, as absolute negativity, has, however, limits in itself. On the other hand, Gorgias is quite right, for the bad, sensuous infinite is nowhere present, and thus does not exist, but is a Beyond of Being; only we may take what Gorgias takes as a diversity of place, as being diversity generally. Thus, instead of placing the infinite, like Gorgias, sometimes in another, sometimes within itself, *i.e.* sometimes maintaining it to be different, sometimes abrogating the diversity, we may say better and more universally, that this sensuous infinite

is a diversity which is always posited as different from the existent, for it is just the being different from itself.

"In the same way Being has not originated, because it must then have come either from the existent or from the non-existent. From the existent it did not arise, for then it would be already; just as little from the non-existent, because this cannot beget anything."[112] The sceptics followed this up further. The object to be contemplated hence ever becomes posited under determinations with 'either' 'or,' which then contradict one another. But that is not the true dialectic, because the object resolves itself into those determinations only; when nothing follows respecting the nature of the object itself, then, as is already proved, the object must be necessarily in one determination, and not in and for itself.

ββ. In a similar way Gorgias shows "of what exists, that it must either be one or many; but neither is possible. For as one, it would have a certain magnitude, or continuity, or number, or body, but all this is not one, but different, divisible. Every sensuous one is, in fact, necessarily another, a manifold. If it is not one, it cannot be many, for the many is many ones."[113]

γ. "Similarly both, Being and non-being, cannot exist at the same time. If one exists as much as the other, they are the same, and therefore neither of them is, for the non-being does not exist, and hence neither does the Being, since it is identical with it. Nor can they, on the other hand, both exist, for if they are identical, I cannot express them both,"[114] and thus both do not exist, for if I express both, I differentiate. This dialectic, which Aristotle (De Xenoph. &c., c. 5) likewise designates as peculiar to Gorgias, has its truth. In speaking of Being and non-being, we always say the opposite to what we wish. Being and non-being are the same, just as they are not the same; if they are the same, I speak of the two as different: if different, I express the same predicate of them, diversity. This dialectic is not to be despised by us, as if it dealt with empty abstractions, for these categories are, on the one

hand, in their purity the most universal, and if, on the other hand, they are not the ultimate, yet it is always Being or non-being that are in question; they are not, however, definitely fixed and divided off, but are self-abrogating. Gorgias is conscious that they are vanishing moments, while the ordinary unconscious conception also has present to it this truth, but knows nothing about it.

b. The relation of the conceiver to conception, the difference between conception and Being, is a subject which is in our mouths to-day. "But if there is an 'is,' it is unknowable and unthinkable, for what is presented is not the existent" but only a presentation. "If what is presented is white, it is the case that white is presented; if what is presented is not the really existent, it is the case that what is, is not presented. For if what is presented is the real existent, everything that is presented also exists, but no one says that if a flying man, or waggon riding on the sea were presented to us, it would exist. Further, if what is presented is the existent, the non-existent is not presented, for opposites are in opposition. But this non-existent is everywhere presented as it is in Scylla and the Chimæra.[115] Gorgias on the one hand pronounces a just polemic against absolute realism, which, because it represents, thinks to possess the very thing itself, when it only has a relative, but he falls, on the other hand, into the false idealism of modern times, according to which thought is always subjective only, and thus not the existent, since through thought an existent is transformed into what is thought."

c. We finally have the basis of the dialectic of Gorgias in respect of the third point, that knowledge cannot be imparted, in this: "If the existent were presented, it could still not be expressed and imparted. Things are visible, audible, &c., or are experienced. The visible is grasped through sight, the audible through hearing, and not the contrary way; thus, the one cannot be indicated by the other. Speech, by which the existent has to be expressed, is

not the existent; what is imparted is thus not the existent, but only words.[116] In this manner Gorgias' dialectic is the laying hold of this difference exactly as again occurred in Kant; if I maintain this difference, certainly that which is, cannot be known."

This dialectic is undoubtedly impregnable to those who maintain sensuous Being to be real. But its truth is only this movement to posit itself negatively as existent, and the unity is the reflection that the existent, comprehended also as non-existent, becomes, in this comprehension of it, universal. That this existent cannot be imparted, must likewise be held most strongly, for *this* individual cannot be expressed. Philosophic truth is thus not only expressed as if there were another truth in sensuous consciousness; but Being is present in that philosophic truth expresses it. The Sophists thus also made dialectic, universal Philosophy, their object, and they were profound thinkers.

B. — Socrates.

CONSCIOUSNESS HAD REACHED this point in Greece, when in Athens the great form of Socrates, in whom the subjectivity of thought was brought to consciousness in a more definite and more thorough manner, now appeared. But Socrates did not grow like a mushroom out of the earth, for he stands in continuity with his time, and thus is not only a most important figure in the history of Philosophy — perhaps the most interesting in the philosophy of antiquity — but is also a world-famed personage. For a mental turning-point exhibited itself in him in the form of philosophic thought. If we shortly recall the periods already passed over, we find that the ancient Ionic philosophers certainly thought, but without reflecting on the thought or defining its product as thought. The Atomists made objective existence into thoughts, but these were to them only abstractions, pure entities. Anaxagoras, on the other hand, raised thought as such, into a principle which thereby presented itself as the all-powerful Notion, as the negative power over all that is definite and existent. Protagoras finally expresses thought as real existence, but it is in this its movement, which is the all-resolving consciousness, the unrest of the Notion. This unrest is in itself at the same time something restful or secure. But the fixed point of motion as such, is the 'I,' for it has the moments of movement outside of it; as the self-retaining, which only abrogates what is different, the 'I' is negative unity, but just in that very way individual, and not yet the universal reflected within itself. Now we here find the ambiguity of dialectic and sophistry, which rests in the fact that if the objective disappears, the signification of the fixed subjective is either that of the individual opposed to the objective, and thereby the contingent and lawless will, or that of the

objective and universal in itself. Socrates expresses real existence as the universal 'I,' as the consciousness which rests in itself; but that is the good as such, which is free from existent reality, free from individual sensuous consciousness of feeling and desire, free finally from the theoretically speculative thought about nature, which, if indeed thought, has still the form of Being and in which I am not certain of my existence.

Socrates herein adopted firstly the doctrine of Anaxagoras that thought, the understanding, is the ruling and self-determining universal, though this principle did not, as with the Sophists, attain the form of formal culture or of abstract philosophizing. Thus, if with Socrates, as with Protagoras, the self-conscious thought that abrogates all that is determined, was real existence, with Socrates this was the case in such a way that he at the same time grasped in thought rest and security. This substance existing in and for itself, the self-retaining, has become determined as end, and further as the true and the good.

To this determination of the universal, we have, in the second place, to add that this good, which has by me to be esteemed as substantial end, must be known by me; with this the infinite subjectivity, the freedom of self-consciousness in Socrates breaks out. This freedom which is contained therein, the fact that consciousness is clearly present in all that it thinks, and must necessarily be at home with itself, is in our time constantly and plainly demanded; the substantial, although eternal and in and for itself, must as truly be produced through me; but this my part in it is only the formal activity. Thus Socrates' principle is that man has to find from himself both the end of his actions and the end of the world, and must attain to truth through himself. True thought thinks in such a way that its import is as truly objective as subjective. But objectivity has been the significance of substantial universality, and not of external objectivity; thus truth is now posited as a product mediated through thought, while untrained morality, as

Sophocles makes Antigone say (vers. 454-457), is “the eternal law of the Gods”:

“And no one knew from whence it came.”

But though in modern times we hear much said of immediate knowledge and belief, it is a misconception to maintain that their content, God, the Good, Just, &c., although the content of feeling and conception, is not, as spiritual content, also posited through thought. The animal has no religion, because it only feels; but what is spiritual rests on the mediation of thought, and pertains to man.

Since Socrates thus introduces the infinitely important element of leading back the truth of the objective to the thought of the subject, just as Protagoras says that the objective first is through relation to us, the battle of Socrates and Plato with the Sophists cannot rest on the ground that these, as belonging to the old faith, maintained against the others the religion and customs of Greece, for the violation of which Anaxagoras was condemned. Quite the contrary. Reflection, and the reference of any judgment to consciousness, is held by Socrates in common with the Sophists. But the opposition into which Socrates and Plato were in their philosophy necessarily brought in regard to the Sophists, as the universal philosophic culture of the times, was as follows: — The objective produced through thought, is at the same time in and for itself, thus being raised above all particularity of interests and desires, and being the power over them. Hence because, on the one hand, to Socrates and Plato the moment of subjective freedom is the directing of consciousness into itself, on the other, this return is also determined as a coming out from particular subjectivity. It is hereby implied that contingency of events is abolished, and man has this outside within him, as the spiritual universal. This is the true, the unity of subjective and objective in modern terminology, while the Kantian ideal is only phenomenal and not objective in itself.

In the third place Socrates accepted the Good at first only in the particular significance of the practical, which nevertheless is only one mode of the substantial Idea; the universal is not only for me, but also, as end existent in and for itself, the principle of the philosophy of nature, and in this higher sense it was taken by Plato and Aristotle. Of Socrates it is hence said, in the older histories of Philosophy, that his main distinction was having added ethics as a new conception to Philosophy, which formerly only took nature into consideration. Diogenes Laertius, in like manner says (III., 56), that the Ionics founded natural philosophy, Socrates ethics, and Plato added to them dialectic. Now ethics is partly objective, and partly subjective and reflected morality (Sittlichkeit und Moralität),[117] and the teaching of Socrates is properly subjectively moral, because in it the subjective side, my perception and meaning, is the prevailing moment, although this determination of self-positing is likewise sublated, and the good and eternal is what is in and for itself. Objective morality is, on the contrary, natural, since it signifies the knowledge and doing of what is in and for itself good. The Athenians before Socrates were objectively, and not subjectively, moral, for they acted rationally in their relations without knowing that they were particularly excellent. Reflective morality adds to natural morality the reflection that this is the good and not that; the Kantian philosophy, which is reflectively moral, again showed the difference.

Because Socrates in this way gave rise to moral philosophy, all succeeding babblers about morality and popular philosophy constituted him their patron and object of adoration, and made him into a cloak which should cover all false philosophy. As he treated it, it was undoubtedly popular; and what contributed to make it such was that his death gave him the never-failing interest derived from innocent suffering. Cicero (Tusc. Quæst. V. 4), whose manner of thought was, on the one hand, of the present, and who, on the other hand, had the belief that Philosophy should yield

itself up, and hence succeeded in attaining to no content in it, boasted of Socrates (what has often enough been said since) that his most eminent characteristic was to have brought Philosophy from heaven to earth, to the homes and every-day life of men, or, as Diogenes Laertius expresses it (II. 21), “into the market place.” There we have what has just been said. This would seem as if the best and truest Philosophy were only a domestic or fireside philosophy, which conforms to all the ordinary ideas of men, and in which we see friends and faithful ones talk together of righteousness, and of what can be known on the earth, without having penetrated the depths of the heavens, or rather the depths of consciousness. But this last is exactly what Socrates, as these men themselves indicate, first ventured to do. And it was not incumbent on him to reflect upon all the speculations of past Philosophy, in order to be able to come down in practical philosophy to inward thought. This gives a general idea of his principle.

We must examine more closely this noteworthy phenomenon, and begin with the history of Socrates’ life. This is, however, closely intertwined with his interest in Philosophy, and the events of his life are bound up with his principles. We have first of all to consider the beginning of his life only. Socrates, whose birth occurs in the fourth year of the 77th Olympiad (469 B.C.), was the son of Sophroniscus, a sculptor, and of Phænarete, a midwife. His father brought him up to sculpture, and it is said that Socrates acquired skill in the art, and long after, statues of draped Graces, found in the Acropolis, were ascribed to him. But his art did not satisfy him; a great desire for Philosophy, and love of scientific research, got possession of him. He pursued his art merely to get money for a necessary subsistence, and to be able to apply himself to the study of the sciences; and it is told of Crito, an Athenian, that he defrayed the cost of Socrates’ instruction by masters in all the arts. During the exercise of his art, and specially after he gave it up altogether, he read the works of ancient philosophers in so far as he could

get possession of them. At the same time he attended Anaxagoras' instructions, and, after his expulsion from Athens, at which time Socrates was thirty-seven years old, those of Archelaus, who was regarded as Anaxagoras' successor, besides those of Sophists celebrated in other sciences. Amongst these he heard Prodicus, a celebrated teacher of oratory, whom, according to Xenophon (Memorab. II. c. 1, §§ 21, 34), he mentions with affection, and other teachers of music, poetry, etc. He was esteemed as on all sides a man of culture, who was instructed in everything then requisite thereto.[118]

Another feature in his life was that he fulfilled the duty of protecting his country, which rested on him as an Athenian citizen. Hence he made three campaigns in the Peloponnesian war, which occurred during his life. The Peloponnesian war led to the dissolution of Greek life, inasmuch as it was preparatory to it; and what took place politically was by Socrates carried out in thinking consciousness. In these campaigns he not only acquired the fame of a brave warrior, but, what was best of all, the merit of having saved the lives of other citizens. In the first, he was present at the tedious siege of Potidæa in Thrace. Here Alcibiades had already attached himself to him, and, according to Plato, he recited in the Banquet (p. 219-222, Steph.; p. 461-466, Bekk.), a eulogy on Socrates for being able to endure all toil, hunger and thirst, heat and cold, with mind at rest and health of body. In an engagement in this campaign he saw Alcibiades wounded in the midst of the enemy, lifted him up, forced his way through, and saved both him and his arms. The generals rewarded him with a wreath, which was the prize of the bravest; Socrates did not, however, take it, maintaining that it was given to Alcibiades. In this campaign it is said that once, sunk in deep meditation, he stood immovable on one spot the whole day and night, until the morning sun awoke him from his trance — a condition in which he is said often to have been. This was a cataleptic state, which may bear some relation to

magnetic somnambulism, in which Socrates became quite dead to sensuous consciousness. From this physical setting free of the inward abstract self from the concrete bodily existence of the individual, we have, in the outward manifestation, a proof of how the depths of his mind worked within him. In him we see pre-eminently the inwardness of consciousness that in an anthropological way existed in the first instance in him, and became later on a usual thing. He made his other campaign in Bœotia at Delium, a small fortification which the Athenians possessed not far from the sea, and where they had an unfortunate, though not an important engagement. Here Socrates saved another of his favourites, Xenophon; he saw him in the flight, for Xenophon, having lost his horse, lay wounded on the ground. Socrates took him over his shoulders, carried him off, defending himself at the same time with the greatest tranquillity and presence of mind from the pursuing enemy. Finally he made his last campaign at Amphipolis in Edonis, on the Strymonian Bay.[119]

Besides this, he occupied various civil offices. At the time when the democratic constitution of Athens hitherto existing, was taken away by the Lacedemonians, who now introduced everywhere an aristocratic and indeed tyrannical rule, whereby they in great measure put themselves at the head of affairs, he was chosen for the council, which, as a representative body, took the place of the people. Here he distinguished himself by his immovable firmness in what he held to be right as against the wills of the thirty tyrants, as formerly against the will of the people. For he sat in the tribunal which condemned the ten generals to death, because, as admirals at the battle of Arginusæ, though they certainly had conquered, yet, being kept back through storm, they had not dragged out the bodies nor buried them on the shore, and because they neglected to erect trophies; *i.e.* really because they did not stand their ground, and thus appeared to have been beaten. Socrates alone did not agree with this decision, declaring himself more emphatically

against the people than against the rulers.[120] To-day he fares badly who says anything against the people. “The people have excellent intelligence, understand everything, and have only the most excellent intentions.” As to rulers, governments, ministers, it is self-evident that “they understand nothing, and only desire and bring forth what is bad.”

Along with these to him more accidental relationships to the State, in which he acted only from the ordinary sense of citizenship, without spontaneously making the affairs of the State his real business, or pressing on to the head of public affairs, the real business of his life was to discuss moral philosophy with any who came in his way. His philosophy, which asserts that real existence is in consciousness as a universal, is still not a properly speculative philosophy, but remained individual; yet the aim of his philosophy was that it should have a universal significance. Hence we have to speak of his own individual being, of his thoroughly noble character, which usually is depicted as a complete catalogue of the virtues adorning the life of a private citizen; and these virtues of Socrates are certainly to be looked at as his own, and as made habitual to him by his own will. It has to be noted that with the ancients these qualities have generally more of the character of virtue, because with the ancients, in ordinary morality, individuality, as the form of the universal, was given free scope, so that virtues were regarded more as the actions of the individual will, and thus as personal qualities; while with us they seem to be less what is meritorious to the individual, or what comes from himself as this unit. We are accustomed to think of them much more as what exists, as duty, because we have a fuller consciousness of the universal, and consider the pure individual, the personal inward consciousness, as real existence and duty. With us virtues are hence actually either elements in our dispositions and nature, or they have the form of the universal and of what is necessary; but with Socrates they have the form, not of ordinary morality or of a natural or necessary

thing, but of an independent determination. It is well known that his appearance indicated naturally low and hateful qualities, which, as indeed he says, he himself subdued.

He lived amongst his fellow-citizens, and stands before us as one of those great plastic natures consistent through and through, such as we often see in those times — resembling a perfect classical work of art which has brought itself to this height of perfection. Such individuals are not made, but have formed themselves into what they are; they have become that which they wished to be, and are true to this. In a real work of art the distinguishing point is that some idea is brought forth, a character is presented in which every trait is determined by the idea, and, because this is so, the work of art is, on the one hand, living, and, on the other, beautiful, for the highest beauty is just the most perfect carrying out of all sides of the individuality in accordance with the one inward principle. Such works of art are also seen in the great men of every time. The most plastic individual as a statesman is Pericles, and round him, like stars, Sophocles, Thucydides, Socrates, &c., worked out their individuality into an existence of its own — into a character which regulated their whole being, and which was one principle running throughout the whole of their existence. Pericles alone lived with the sole end of being a statesman. Plutarch (in Pericle, c. 5, 7) says of him that, from the time that he devoted himself to the business of the State, he laughed no more, and never again went to a feast. Thus, too, Socrates formed himself, through his art and through the power of self-conscious will, into this particular character, and acquired this capacity for the business of his life. Through his principle he attained that far-reaching influence which has lasted to the present day in relation to religion, science, and justice, for since his time the genius of inward conviction has been the basis which must be fundamental. And since this principle proceeded from the plasticity of his character, it is very inappropriate when Tennemann

regrets (Vol. II. p. 26) “that though we know what he was, we do not know how he became such.”

Socrates was a peaceful, pious example of the moral virtues — of wisdom, discretion, temperance, moderation, justice, courage, inflexibility, firm sense of rectitude in relation to tyrants and people; he was equally removed from cupidity and despotism. His indifference to money was due to his own determination, for, according to the custom of the times, he could acquire it through the education of youth, like other teachers. On the other side, this acquisition was purely matter of choice, and not, as with us, something which is accepted, so that to take nothing would be to break through a custom, thus to present the appearance of wishing to become conspicuous, and to be more blamed than praised. For this was not yet a State affair; it was under the Roman emperors that there first were schools with payment. This moderation of his life was likewise a power proceeding from conscious knowledge, but this is not a principle found to hand, but the regulation of self in accordance with circumstances; in company he was, however, a good fellow. His sobriety in respect to wine is best depicted in Plato’s “Symposium,” in a very characteristic scene in which we see what Socrates called virtue. Alcibiades there appears, no longer sober, at a feast given by Agathon, on the occasion of a success which his tragedy had obtained on the previous day at the games. Since the company had drunk much on the first day of the feast, the assembled guests, amongst whom was Socrates, this evening took a resolution, in opposition to the Greek custom at meals, to drink little. Alcibiades, finding that he was coming in amongst abstemious men, and that there was no one else in his own frame of mind, made himself king of the feast, and offered the goblet to the others, in order to bring them into the condition reached by himself; but with Socrates he said that he could do nothing, because he remained as he was, however much he drank. Plato then makes the individual who tells what happened at

the Banquet, also tell that he, with the others, at last fell asleep on the couch, and as he awoke in the morning, Socrates, cup in hand, still talked with Aristophanes and Agathon about comedy and tragedy, and whether one man could write both comedies and tragedies, and then went at the usual time into the public places, to the Lyceum, as if nothing had happened, and walked about the whole day as usual.[121] This is not a moderation which exists in the least possible enjoyment, no aimless abstemiousness and self-mortification, but a power belonging to consciousness, which keeps its self-possession in bodily excess. We see from this that we have not to think of Socrates throughout after the fashion of the litany of moral virtues.

His behaviour to others was not only just, true, open, without rudeness, and honourable, but we also see in him an example of the most perfect Attic urbanity; i.e. he moves in the freest possible relations, has a readiness for conversation which is always judicious, and, because it has an inward universality, at the same time always has the right living relationship to the individual, and bears upon the case on which it operates. The intercourse is that of a most highly cultured man who, in his relation to others, never places anything personal in all his wit, and sets aside all that is unpleasant. Thus Xenophon's, but particularly Plato's Socratic Dialogues belong to the highest type of this fine social culture.

Because the philosophy of Socrates is no withdrawal from existence now and here into the free, pure regions of thought, but is in a piece with his life, it does not proceed to a system; and the manner of his philosophizing, which appears to imply a withdrawal from actual affairs as it did to Plato, yet in that very way gives itself this inward connection with ordinary life. For his more special business was his philosophic teaching, or rather his philosophic social intercourse (for it was not, properly speaking, teaching) with all; and this outwardly resembled ordinary Athenian life in which the

greater part of the day was passed without any particular business, in loitering about the market-place, or frequenting the public Lyceum, and there partly partaking of bodily exercises, and partly and principally, talking with one another. This kind of intercourse was only possible in the Athenian mode of life, where most of the work which is now done by a free citizen — by a free republican and free imperial citizen alike — was performed by slaves, seeing that it was deemed unworthy of free men. A free citizen could in Athens certainly be a handicraftsman, but he had slaves who did the work, just as a master now has workmen. At the present day such a life of movement would not be suitable to our customs. Now Socrates also lounged about after this manner, and lived in this constant discussion of ethical questions.[122] Thus what he did was what came naturally to him, and what can in general be called moralizing; but its nature and method was not that of preaching, exhortation or teaching; it was not a dry morality. For amongst the Athenians and in Attic urbanity, this had no place, since it is not a reciprocal, free, and rational relationship. But with all men, however different their characters, he entered on one kind of dialogue, with all that Attic urbanity which, without presumption on his part, without instructing others, or wishing to command them, while maintaining their perfect right to freedom, and honouring it, yet causes all that is rude to be suppressed.

1. *The Socratic Method.* In this conversation Socrates' philosophy is found, as also what is known as the Socratic method, which must in its nature be dialectic, and of which we must speak before dealing with the content. Socrates' manner is not artificial; the dialogues of the moderns, on the contrary, just because no internal reason justifies their form, are necessarily tedious and heavy. But the principle of his philosophy falls in with the method itself, which thus far cannot be called method, since it is a mode which quite coincides with the moralizing peculiar to Socrates. For the chief content is to know the good as the absolute, and that particularly in

relation to actions. Socrates gives this point of view so high a place, that he both puts aside the sciences which involve the contemplation of the universal in nature, mind, &c., himself, and calls upon others to do the same.[123] Thus it can be said that in content his philosophy had an altogether practical aspect, and similarly the Socratic method, which is essential to it, was distinguished by the system of first bringing a person to reflection upon his duty by any occasion that might either happen to be offered spontaneously, or that was brought about by Socrates. By going to the work-places of tailors and shoemakers, and entering into discourse with them, as also with youths and old men, Sophists, statesmen, and citizens of all kinds, he in the first place took their interests as his topic — whether these were household interests, the education of children, or the interests of knowledge or of truth. Then he led them on from a definite case to think of the universal, and of truths and beauties which had absolute value, since in every case, from the individual's own thoughts, he derived the conviction and consciousness of that which is the definite right. This method has two prominent aspects, the one the development of the universal from the concrete case, and the exhibition of the notion which implicitly exists in every consciousness,[124] and the other is the resolution of the firmly established, and, when taken immediately in consciousness, universal determinations of the sensuous conception or of thought, and the causing of confusion between these and what is concrete.

a. If we proceed from the general account of Socrates' method to a nearer view, in the first place its effect is to inspire men with distrust towards their presuppositions, after faith had become wavering and they were driven to seek that which is, in themselves. Now whether it was that he wished to bring the manner of the Sophists into disrepute, or that he was desirous to awaken the desire for knowledge and independent thought in the youths whom he attracted to himself, he certainly began by adopting the

ordinary conceptions which they considered to be true. But in order to bring others to express these, he represents himself as in ignorance of them, and, with a seeming ingenuousness, puts questions to his audience as if they were to instruct him, while he really wished to draw them out. This is the celebrated Socratic irony, which in his case is a particular mode of carrying on intercourse between one person and another, and is thus only a subjective form of dialectic, for real dialectic deals with the reasons for things. What he wished to effect was, that when other people brought forward their principles, he, from each definite proposition, should deduce as its consequence the direct opposite of what the proposition stated, or else allow the opposite to be deduced from their own inner consciousness without maintaining it directly against their statements. Sometimes he also derived the opposite from a concrete case. But as this opposite was a principle held by men as firmly as the other, he then went on to show that they contradicted themselves. Thus Socrates taught those with whom he associated to know that they knew nothing; indeed, what is more, he himself said that he knew nothing, and therefore taught nothing. It may actually be said that Socrates knew nothing, for he did not reach the systematic construction of a philosophy. He was conscious of this, and it was also not at all his aim to establish a science.

On the one view, this irony seems to be something untrue. But when we deal with objects which have a universal interest, and speak about them to one and to another, it is always the case that one does not understand another's conception of the object. For every individual has certain ultimate words as to which he presupposes a common knowledge. But if we really are to come to an understanding, we find it is these presuppositions which have to be investigated. For instance, if in more recent times belief and reason are discussed as the subjects of present intellectual interest, everyone pretends that he knows quite well what reason, &c., is, and it is considered

ill-bred to ask for an explanation of this, seeing that all are supposed to know about it. A very celebrated divine, ten years ago,[125] published ninety theses on reason, which contained very interesting questions, but resulted in nothing, although they were much discussed, because one person's assertions issued from the point of view of faith, and the other's from that of reason, and each remained in this state of opposition, without the one's knowing what the other meant. Thus what would make an understanding possible is just the explanation of what we think is understood, without really being so. If faith and knowledge certainly differ from one another at the first, yet through this declaration of their notional determinations the common element will at once appear; in that way questions like these and the trouble taken with them may, for the first time, become fruitful; otherwise men may chatter this way and that for years, without making any advance. For if I say I know what reason, what belief is, these are only quite abstract ideas; it is necessary, in order to become concrete, that they should be explained, and that it should be understood that what they really are, is unknown. The irony of Socrates has this great quality of showing how to make abstract ideas concrete and effect their development, for on that alone depends the bringing of the Notion into consciousness.

In recent times much has been said about the Socratic irony which, like all dialectic, gives force to what is taken immediately, but only in order to allow the dissolution inherent in it to come to pass; and we may call this the universal irony of the world. Yet men have tried to make this irony of Socrates into something quite different, for they extended it into a universal principle; it is said to be the highest attitude of the mind, and has been represented as the most divine. It was Friedrich von Schlegel who first brought forward this idea, and Ast repeated it, saying, "The most ardent love of all beauty in the Idea, as in life, inspires Socrates' words with inward, unfathomable life." This life is now said to be irony! But this irony

issues from the Fichtian philosophy, and is an essential point in the comprehension of the conceptions of most recent times. It is when subjective consciousness maintains its independence of everything, that it says, "It is I who through my educated thoughts can annul all determinations of right, morality, good, &c., because I am clearly master of them, and I know that if anything seems good to me I can easily subvert it, because things are only true to me in so far as they please me now." This irony is thus only a trifling with everything, and it can transform all things into show: to this subjectivity nothing is any longer serious, for any seriousness which it has, immediately becomes dissipated again in jokes, and all noble or divine truth vanishes away or becomes mere triviality. But the Greek gaiety, as it breathes in Homer's poems, is ironical, for Eros mocks the power of Zeus and of Mars; Vulcan, limping along, serves the gods with wine, and brings upon himself the uncontrollable laughter of the immortal gods. Juno boxes Diana's ears. Thus, too, there is irony in the sacrifices of the ancients, who themselves consumed the best; in the pain that laughs, in the keenest joy which is moved to tears, in the scornful laughter of Mephistopheles, and in every transition from one extreme to another — from what is best to what is worst. Sunday morning may be passed in deep humility, profoundest contrition and self-abasement, in striking the breast in penitence, and the evening in eating and drinking to the full, going the round of pleasures, thus allowing self to re-assert its independence of any such subjection. Hypocrisy, which is of the same nature, is the truest irony. Socrates and Plato were falsely stated to be the originators of this irony, of which it is said that it is the "inmost and deepest life," although they possessed the element of subjectivity; in our time it was not permitted to us to give effect to this irony. Ast's "inmost, deepest life" is just the subjective and arbitrary will, the inward divinity which knows itself to be exalted above all. The divine is said to be the purely negative attitude,

the perception of the vanity of everything, in which my vanity alone remains. Making the consciousness of the nullity of everything ultimate, might indeed indicate depth of life, but it only is the depth of emptiness, as may be seen from the ancient comedies of Aristophanes. From this irony of our times, the irony of Socrates is far removed; as is also the case with Plato, it has a significance which is limited. Socrates' premeditated irony may be called a manner of speech, a pleasant rallying; there is in it no satirical laughter or pretence, as though the idea were nothing but a joke. But his tragic irony is his opposition of subjective reflection to morality as it exists, not a consciousness of the fact that he stands above it, but the natural aim of leading men, through thought, to the true good and to the universal Idea.

b. Now the second element is what Socrates has called the art of midwifery — an art which came to him from his mother.[126] It is the assisting into the world of the thought which is already contained in the consciousness of the individual — the showing from the concrete, unreflected consciousness, the universality of the concrete, or from the universally posited, the opposite which already is within it. Socrates hence adopts a questioning attitude, and this kind of questioning and answering has thus been called the Socratic method; but in this method there is more than can be given in questions and replies. For the answer seems occasionally to be quite different from what was intended by the question, while in printed dialogue, answers are altogether under the author's control; but to say that in actual life people are found to answer as they are here made to do, is quite another thing. To Socrates those who reply may be called pliable youths, because they reply directly to the questions, which are so formed that they make the answer very easy, and exclude any originality in reply. To this plastic manner, which we see in the method of Socrates, as represented by Plato and Xenophon, it is objected that we do not answer in

the same relation in which the questioner asks; while, with Socrates, the relation which the questioner adopts is respected in the reply. The other way, which is to bring forward another point of view, is undoubtedly the spirit of an animated conversation, but such emulation is excluded from this Socratic method, in which the principal matter is to keep to the point. The spirit of dogmatism, self-assertion, stopping short when we seem to get into difficulties, and escaping from them by a jest, or by setting them aside — all these attitudes and methods are here excluded; they do not constitute good manners, nor do they have a place in Socrates' dialogues. In these dialogues, it is hence not to be wondered at that those questioned answered so precisely to the point, while in the best modern dialogues there is always an arbitrary element.

This difference concerns only what is external and formal. But the principal point, and the reason why Socrates set to work with questions in bringing the good and right into consciousness in universal form, was that he did not proceed from what is present in our consciousness in a simple form through setting forth the conception allied to it in pure necessity, which would be a deduction, a proof or, speaking generally, a consequence following from the conception. But this concrete, as it is in natural consciousness without thinking of it, or universality immersed in matter, he analyzed, so that through the separation of the concrete, he brought the universal contained therein to consciousness as universal. We see this method also carried on to a large extent in Plato's dialogues, where there is, in this regard, particular skill displayed. It is the same method which forms in every man his knowledge of the universal; an education in self-consciousness, which is the development of reason. The child, the uncultured man, lives in concrete individual ideas, but to the man who grows and educates himself, because he thereby goes back into himself as thinking, reflection becomes reflection on the universal and the permanent

establishment of the same; and a freedom — formerly that of moving in concrete ideas — is now that of so doing in abstractions and in thoughts. We see such a development of universal from particular, where a number of examples are given, treated in a very tedious way. For us who are trained in presenting to ourselves what is abstract, who are taught from youth up in universal principles, the Socratic method of so-called deference, with its eloquence, has often something tiresome and tedious about it. The universal of the concrete case is already present to us as universal, because our reflection is already accustomed to the universal, and we do not require, first of all, to take the trouble of making a separation; and thus, if Socrates were now to bring what is abstract before consciousness, we should not require, in order to establish it as universal, that all these examples should be adduced, so that through repetition the subjective certainty of abstraction might arise.

c. The next result of this method of procedure may be that consciousness is surprised that what it never looked for should be found in consciousness. If we reflect, for example, on the universally known idea of Becoming, we find that what becomes is not and yet it is; it is the identity of Being and non-being, and it may surprise us that in this simple conception so great a distinction should exist.

The result attained was partly the altogether formal and negative one of bringing home to those who conversed with Socrates, the conviction that, however well acquainted with the subject they had thought themselves, they now came to the conclusion, "that what we knew has refuted itself." Socrates thus put questions in the intent that the speaker should be drawn on to make admissions, implying a point of view opposed to that from which he started. That these contradictions arise because they bring their ideas together, is the drift of the greater part of Socrates' dialogues; their main tendency consequently was to show the bewilderment and confusion which

exist in knowledge. By this means, he tries to awaken shame, and the perception that what we consider as true is not the truth, from which the necessity for earnest effort after knowledge must result. Plato, amongst others, gives these examples in his Meno (p. 71-80, Steph.; p. 327-346, Bekk.). Socrates is made to say, “By the gods, tell me what is virtue.” Meno proceeds to make various distinctions: “Man’s virtue is to be skilful in managing state affairs, and thereby to help friends and harm foes; woman’s to rule her household; other virtues are those of boys, of young men, of old men,” &c. Socrates interrupts him by saying, that it is not that about which he inquires, but virtue in general, which comprehends every thing in itself. Meno says “It is to govern and rule over others.” Socrates brings forward the fact that the virtue of boys and slaves does not consist in governing. Meno says that he cannot tell what is common in all virtue. Socrates replies that it is the same as figure, which is what is common in roundness, squareness, &c. There a digression occurs. Meno says, “Virtue is the power of securing the good desired.” Socrates interposes that it is superfluous to say the good, for from the time that men know that something is an evil, they do not desire it; and also the good must be acquired in a right way. Socrates thus confounds Meno, and he sees that these ideas are false. The latter says, “I used to hear of you, before I knew you, that you were yourself in doubt (*ἀπορεῖς*), and also brought others into doubt, and now you cast a spell on me too, so that I am at my wits’ end (*ἀπορίας*). You seem, if I may venture to jest, to be like the torpedo fish, for it is said of it that it makes torpid (*ναρκᾷν*) those who come near it and touch it. You have done this to me, for I am become torpid in body and soul, and I do not know how to answer you, although I have talked thousands of times about virtue with many persons, and, as it seemed to me, talked very well. But now I do not know at all what to say. Hence you do well not to travel amongst strangers, for you might be put to death as a magician.” Socrates again wishes to

"inquire." Now Meno says, "How can you inquire about what you say you do not know? Can you have a desire for what you do not know? And if you find it out by chance, how can you know that it is what you looked for, since you acknowledge that, you do not know it?" A number of dialogues end in the same manner, both in Xenophon and Plato, leaving us quite unsatisfied as to the result. It is so in the Lysis, where Plato asks the question of what love and friendship secures to men; and similarly the Republic commences by inquiring what justice is. Philosophy must, generally speaking, begin with a puzzle in order to bring about reflection; everything must be doubted, all presuppositions given up, to reach the truth as created through the Notion.

2. *The Principle of the Good.* This, in short, is Socrates' method. The affirmative, what Socrates develops in the consciousness, is nothing but the good in as far as it is brought forth from consciousness through knowledge — it is the eternal, in and for itself universal, what is called the Idea, the true, which just in so far as it is end, is the Good. In this regard Socrates is opposed to the Sophists, for the proposition that man is the measure of all things, to them still comprehends particular ends, while to Socrates the universal brought forth through free thought is thereby expressed in objective fashion. Nevertheless, we must not blame the Sophists because, in the aimlessness of their time, they did not discover the principle of the Good; for every discovery has its time, and that of the Good, which as end in itself is now always made the starting point, had not yet been made by Socrates. It now seems as if we had not yet shown forth much of the Socratic philosophy, for we have merely kept to the principle; but the main point with Socrates is that his knowledge for the first time reached this abstraction. The Good is nevertheless no longer as abstract as the *νοῦς* of Anaxagoras, but is the universal which determines itself in itself, realizes itself, and has to be realized as the end of the world and of the individual. It

is a principle, concrete within itself, which, however, is not yet manifested in its development, and in this abstract attitude we find what is wanting in the Socratic standpoint, of which nothing that is affirmative can, beyond this, be adduced.

a. As regards the Socratic principle, the first determination is the great determination which is, however, still merely formal, that consciousness creates and has to create out of itself what is the true. This principle of subjective freedom was present to the consciousness of Socrates himself so vividly that he despised the other sciences as being empty learning and useless to mankind; he has to concern himself with his moral nature only in order to do what is best — a one-sidedness which is very characteristic of Socrates. This religion of the Good is to Socrates, not only the essential point to which men have to direct their thoughts, but it is that exclusively. We see him showing how from every individual this universal, this absolute in consciousness may be found as his reality. Here we see law, the true and good, what was formerly present as an existent, return into consciousness. But it is not a single chance manifestation in this individual Socrates, for we have to comprehend Socrates and his manifestation. In the universal consciousness, in the spirit of the people to which he belongs, we see natural turn into reflective morality, and he stands above as the consciousness of this change. The spirit of the world here begins to change, a change which was later on carried to its completion. From this higher standpoint, Socrates, as well as the Athenian people and Socrates in them, have to be considered. The reflection of consciousness into itself begins here, the knowledge of the consciousness of self as such, that it is real existence — or that God is a Spirit, or again, in a cruder and more sensuous form, that God takes human form. This epoch begins where essence is given up as Being — even though it be, as hitherto, abstract Being, Being as thought. But this epoch in a naturally moral people in the highest state of

development, makes its appearance as the destruction threatening them or breaking in upon them unprevented. For its morality, as was usually so with the ancients, consisted in the fact that the Good was present as a universal, without its having had the form of the conviction of the individual in his individual consciousness, but simply that of the immediate absolute. It is the authoritative, present law, without testing investigation, but yet an ultimate ground on which this moral consciousness rests. It is the law of the State; it has authority as the law of the gods, and thus it is universal destiny which has the form of an existent, and is recognized as such by all. But moral consciousness asks if this is actually law in itself? This consciousness turned back within itself from everything that has the form of the existent, requires to understand, to know, that the above law is posited in truth, *i.e.* it demands that it should find itself therein as consciousness. In thus returning into themselves the Athenian people are revealed to us: uncertainty as to existent laws as existent has arisen, and a doubt about what was held to be right, the greatest freedom respecting all that is and was respected. This return into itself represents the highest point reached by the mind of Greece, in so far as it becomes no longer the mere existence of these moralities, but the living consciousness of the same, which has a content which is similar, but which, as spirit, moves freely in it. This is a culture which we never find the Lacedæmonians reach. This deepest life of morality is so to speak a free personal consciousness of morality or of God, and a happy enjoyment of them. Consciousness and Being have here exactly the same value and rank; what is, is consciousness; neither is powerful above another. The authority of law is no oppressive bond to consciousness, and all reality is likewise no obstacle to it, for it is secure in itself. But this return is just on the point of abandoning the content, and indeed of positing itself as abstract consciousness, without the content, and, as existent, opposed to it. From this equilibrium of consciousness and Being, consciousness takes up its position

as independent. This aspect of separation is an independent conception, because consciousness, in the perception of its independence, no longer immediately acknowledges what is put before it, but requires that this should first justify itself to it, *i.e.* it must comprehend itself therein. Thus this return is the isolation of the individual from the universal, care for self at the cost of the State; to us, for instance, it is the question as to whether I shall be in eternal bliss or condemnation, whereas philosophic eternity is present now in time, and is nothing other than the substantial man himself. The State has lost its power, which consisted in the unbroken continuity of the universal spirit, as formed of single individuals, so that the individual consciousness knew no other content and reality than law. Morals have become shaken, because we have the idea present that man creates his maxims for himself. The fact that the individual comes to care for his own morality, means that he becomes reflectively moral; when public morality disappears, reflective morality is seen to have arisen. We now see Socrates bringing forward the opinion, that in these times every one has to look after his own morality, and thus he looked after his through consciousness and reflection regarding himself; for he sought the universal spirit which had disappeared from reality, in his own consciousness. He also helped others to care for their morality, for he awakened in them this consciousness of having in their thoughts the good and true, *i.e.* having the potentiality of action and of knowledge. This is no longer there immediately, but must be provided, just as a ship must make provision of water when it goes to places where none is to be found. The immediate has no further authority but must justify itself to thought. Thus we comprehend the special qualities of Socrates, and his method in Philosophy, from the whole; and we also understand his fate from the same.

This direction of consciousness back into itself takes the form — very markedly in Plato — of asserting that man can learn nothing, virtue

included, and that not because the latter has no relation to science. For the good does not come from without, Socrates shows; it cannot be taught, but is implied in the nature of mind. That is to say, man cannot passively receive anything that is given from without like the wax that is moulded to a form, for everything is latent in the mind of man, and he only seems to learn it. Certainly everything begins from without, but this is only the beginning; the truth is that this is only an impulse towards the development of spirit. All that has value to men, the eternal, the self-existent, is contained in man himself, and has to develop from himself. To learn here only means to receive knowledge of what is externally determined. This external comes indeed through experience, but the universal therein belongs to thought, not to the subjective and bad, but to the objective and true. The universal in the opposition of subjective and objective, is that which is as subjective as it is objective; the subjective is only a particular, the objective is similarly only a particular as regards the subjective, but the universal is the unity of both. According to the Socratic principle, nothing has any value to men to which the spirit does not testify. Man in it is free, is at home with himself, and that is the subjectivity of spirit. As it is said in the Bible, "Flesh of my flesh, and bone of my bone," that which is held by me as truth and right is spirit of my spirit. But what spirit derives from itself must come from it as from the spirit which acts in a universal manner, and not from its passions, likings, and arbitrary desires. These, too, certainly come from something inward which is "implanted in us by nature," but which is only in a natural way our own, for it belongs to the particular; high above it is true thought, the Notion, the rational. Socrates opposed to the contingent and particular inward, that universal, true inward of thought. And Socrates awakened this real conscience, for he not only said that man is the measure of all things, but man as thinking is the measure of all things. With Plato we shall, later on, find it formulated that what man seems to receive he only remembers.

As to the question of what is the Good, Socrates recognized its determination as being not only a determination in particularity to the exclusion of the natural side, as determination is understood in empirical science, but even in relation to the actions of men, he holds the Good to be still undetermined, and the ultimate determinateness, or the determining, is what we may call subjectivity generally. That the Good should be determined, primarily signifies that while, at first, in opposition to the Being of reality, it was a general maxim only, that to which the activity of individuality was still wanting, in the second place it was not permitted to be inert, to be mere thought, but had to be present as the determining and actual, and thus as the effectual. It is such only through subjectivity, through the activity of man. That the Good is a determinate thus further means that individuals know what the Good is, and we call this standpoint reflective morality, while natural morality does right unconsciously. Thus to Socrates virtue is perception. For to the proposition of the Platonic Protagoras that all other virtues have a relationship to one another, but that it is not so with valour, since many brave men are to be found who are the most irreligious, unjust, intemperate and uncultured of people (such as a band of robbers), Plato makes Socrates answer that valour, like all virtues, also is a science, that is, it is the knowledge and the right estimation of what is to be feared.[127] By this the distinctive qualities of valour are certainly not unfolded. The naturally moral and upright man is such without his having considered the matter at all; it is his character, and what is good is securely rooted within him. When, on the other hand, consciousness is concerned, the question arises as to whether I directly desire the good or not. Hence this consciousness of morality easily becomes dangerous, and causes the individual to be puffed up by a good opinion of himself, which proceeds from the consciousness of his own power to decide for the good. The 'I' is then the master, he who chooses the Good, and in that there is the conceit of

my knowing that I am an excellent man. With Socrates this opposition of the good and the subject as choosing is not reached, for what is dealt with is only the determination of the Good and the connection therewith of subjectivity; this last, as an individual person who can choose, decides upon the inward universal. We have here on the one side the knowledge of the Good, but, on the other, it is implied that the subject is good, since this is his ordinary character; and the fact that the subject is such, was by the ancients called virtue.

We understand from this the following criticism which Aristotle makes (Magna Mor. I. 1) on the quality of virtue as expounded by Socrates. He says: "Socrates spoke better of virtue than did Pythagoras, but not quite justly, for he made virtues into a science (*ἐπιστήμας*). But this is impossible, since, though all knowledge has some basis (*λόγος*) this basis only exists in thought. Consequently, he places all the virtues in the thinking (*λογιστικῷ*) side of the soul. Hence it comes to pass that he does away with the feeling (*ἄλογον*) part of the soul, that is, the inclination (*πᾶθος*) and the habits (*ἤθος*)," which, however, also pertain to virtue. "But Plato rightly distinguished the thinking and the feeling sides of the soul." This is a good criticism. We see that what Aristotle misses in the determination of virtue in Socrates, is the side of subjective actuality, which we now call the heart. Certainly virtue is determination in accordance with universal, and not with particular ends, but perception is not the only element in virtue. For in order that the good perceived should be virtue, it must come to pass that the whole man, the heart and mind, should be identical with it, and this aspect of Being or of realization generally, is what Aristotle calls *τὸ ἄλογον*. If we understand the reality of the good as universal morality, substantiality is wanting to the perception; but matter, when we regard the inclination of the individual subjective will as this reality. This double want may also be considered as a want of content and of activity, in so far as to the universal

development is wanting; and in the latter case, determining activity comes before us as negative only in reference to the universal. Socrates thus omits, in characterizing virtue, just what we saw had also disappeared in actuality, that is, first the real spirit of a people, and then reality as the sympathies of the individual. For it is just when consciousness is not yet turned back into itself, that the universal good appears to the individual as the object of his sympathy. To us, on the other hand, because we are accustomed to put on one side the good or virtue as practical reason, the other side, which is opposed to a reflective morality, is an equally abstract sensuousness, inclination, passion, and hence the bad. But in order that the universal should be reality, it must be worked out through consciousness as individual, and the carrying into effect pertains to this individuality. A passion, as for example, love, ambition, is the universal itself, as it is self-realizing, not in perception, but in activity; and if we did not fear being misunderstood, we should say that for the individual the universal is his own interests. Yet this is not the place in which to unravel all the false ideas and contradictions present in our culture.

Aristotle (Eth. Nicom. VI. 13), supplementing the one-sidedness of Socrates, further says of him: "Socrates in one respect worked on right lines, but not in the other. For to call virtue scientific knowledge is untrue, but to say that it is not without scientific basis is right. Socrates made virtues into perceptions (*λόγους*), but we say that virtue exists with perception." This is a very true distinction; the one side in virtue is that the universal of end belongs to thought. But in virtue, as character, the other side, active individuality, real soul, must necessarily come forth; and indeed with Socrates the latter appears in a characteristic form of which we shall speak below (p. 421 et seq.).

b. If we consider the universal first, it has within it a positive and a negative side, which we find both united in Xenophon's "Memorabilia," a

work which aims at justifying Socrates. And if we inquire whether he or Plato depicts Socrates to us most faithfully in his personality and doctrine, there is no question that in regard to the personality and method, the externals of his teaching, we may certainly receive from Plato a satisfactory, and perhaps a more complete representation of what Socrates was. But in regard to the content of his teaching and the point reached by him in the development of thought, we have in the main to look to Xenophon.

The fact that the reality of morality had become shaken in the mind of the people, came to consciousness in Socrates; he stands so high because he gave expression to what was present in the times. In this consciousness he elevated morality into perception, but this action is just the bringing to consciousness of the fact that it is the power of the Notion which sublates the determinate existence and the immediate value of moral laws and the sacredness of their implicitude. When perception likewise positively acknowledges as law that which was held to be law (for the positive subsists through having recourse to laws), this acknowledgment of them always passes through the negative mode, and no longer has the form of absolute being-in-itself: it is, however, just as far from being a Platonic Republic. To the Notion too, because to it the determinateness of laws in the form in which they have value to unperceiving consciousness has dissolved, only the purely implicit universal Good is the true. But since this is empty and without reality, we demand, if we are not satisfied with a dull monotonous round, that again a movement should be made towards the extension of the determination of the universal. Now because Socrates remains at the indeterminateness of the good, its determination means for him simply the expression of the particular good. Then it comes to pass that the universal results only from the negation of the particular good; and since this last is just the existing laws of Greek morality, we have here the doubtlessly right, but dangerous element in perception, the showing in all

that is particular only its deficiencies. The inconsistency of making what is limited into an absolute, certainly becomes unconsciously corrected in the moral man; this improvement rests partly on the morality of the subject and partly on the whole of the social life; and unfortunate extremes resulting in conflict are unusual and unfrequent. But since the dialectic sublates the particular, the abstract universal also becomes shaken.

α. Now as regards the positive side, Xenophon tells us in the fourth book of the Memorabilia (c. 2, § 40), how Socrates, once having made the need for perception sensible to the youths, then actually instructed them, and no longer wandered through mere subtleties in his talk, but taught them the good in the clearest and most open way. That is, he showed them the good and true in what is determined, going back into it because he did not wish to remain in mere abstraction. Xenophon gives an example of this (Memorab. IV. c. 4, §§ 12-16, 25) in a dialogue with the Sophist Hippias. Socrates there asserts that the just man is he who obeys the law, and that these laws are divine. Xenophon makes Hippias reply by asking how Socrates could declare it to be an absolute duty to obey the laws, for the people and the governors themselves often condemn them by changing them, which is allowing that they are not absolute. But Socrates answers by demanding if those who conduct war do not again make peace, which is not, any more than in the other case, to condemn war, for each was just in its turn. Socrates thus says, in a word, that the best and happiest State is that in which the citizens are of one mind and obedient to law. Now this is the one side in which Socrates looks away from the contradiction and makes laws and justice, as they are accepted by each individually, to be the affirmative content. But if we here ask what these laws are, they are, we find, just those which have a value at some one time, as they happen to be present in the State and in the idea; at another time they abrogate themselves as determined, and are not held to be absolute.

β. We hence see this other negative side in the same connection when Socrates brings Euthydemus into the conversation, for he asks him whether he did not strive after the virtue without which neither the private man nor the citizen could be useful to himself or to his people or the State. Euthydemus declares that this undoubtedly is so. But without justice, replies Socrates, this is not possible, and he further asks whether Euthydemus had thus attained to justice in himself. Euthydemus answers affirmatively, for he says that he thinks he is no less just than any other man. Socrates now replies, "Just as workmen can show their work, the just will be able to say what their works are." This he also agrees to, and replies that he could easily do so. Socrates now proposes if this is so to write, "on the one hand under *Δ* the actions of the just, and on the other, under *A*, those of the unjust?" With the approbation of Euthydemus, lies, deceit, robbery, making a slave of a free man, thus fall on the side of the unjust. Now Socrates asks, "But if a general subdues the enemy's State, would this not be justice?" Euthydemus says "Yes." Socrates replies, "Likewise if he deceives and robs the enemy and makes slaves?" Euthydemus has to admit the justice of this. It is thus shown "that the same qualities come under the determination both of justice and of injustice." Here it strikes Euthydemus to add the qualification that he intended that Socrates should understand the action to be only in reference to friends; as regards them it is wrong. Socrates accepts this, but proceeds, "If a general at the decisive moment of the battle saw his own army in fear, and he deceived them by falsely saying that help was coming in order to lead them on to victory, could it be deemed right?" Euthydemus acknowledges that it could. Socrates says, "If a father gives a sick child a medicine which it does not wish to take, in its food, and makes it well through deceit, is this right?" Euthydemus— "Yes." Socrates— "Or is anyone wrong who takes arms from his friend secretly or by force, when he sees him in despair, and in the act of taking his own life?" Euthydemus

has to admit that this is not wrong.[128] Thus it is again shown here, that as regards friends also, the same determinations have to hold good on both sides, as justice as well as injustice. Here we see that abstention from lying, deceit, and robbery, that which we naturally hold to be established, contradicts itself by being put into connection with something different, and something which holds equally good. This example further explains how through thought, which would lay hold of the universal in the form of the universal only, the particular becomes uncertain.

γ. The positive, which Socrates sets in the place of what was fixed and has now become vacillating, in order to give a content to the universal, is, on the one hand, and in opposition to this last, obedience to law (p. 416), that is, the mode of thought and idea which is inconsistent; and, on the other hand, since such determinations do not hold good for the Notion, it is perception, in which the immediately posited has now, in the mediating negation, to justify itself as a determination proceeding out of the constitution of the whole. But it is both true that we do not find this perception present in Socrates, for it remains in its content undetermined, and that in reality it is a contingent, which is seen in the fact, that the universal commands, such as "Thou shalt not kill," are connected with a particular content which is conditioned. Now whether the universal maxim in this particular case has value or not, depends first on the circumstances; and it is the perception which discovers the conditions and circumstances whereby exceptions to this law of unconditioned validity arise. However, because through this contingency in the instances, the fixed nature of the universal principle disappears, since it, too, appears as a particular only, the consciousness of Socrates arrives at pure freedom in each particular content. This freedom, which does not leave the content as it is in its dissipated determination to the natural consciousness, but makes it to be penetrated by the universal, is the real mind which, as unity of the universal

content and of freedom, is the veritable truth. Thus if we here consider further what is the true in this consciousness, we pass on to the mode in which the realization of the universal appeared to Socrates himself.

Even the uneducated mind does not follow the content of its consciousness as this content appears in it; but, as mind, it corrects that which is wrong in its consciousness, and is thus implicitly, if not explicitly as consciousness, free. That is, though this consciousness expresses the universal law, "Thou shalt not kill," as a duty, that consciousness — if no cowardly spirit dwells within it — will still bravely attack and slay the enemy in war. Here, if it is asked whether there is a command to kill one's enemies, the reply would be affirmative, as likewise when a hangman puts to death a criminal. But when in private life we become involved with adversaries, this command to kill one's enemies will not occur to us. We may thus call this the mind which thinks at the right time, first of the one, and then of the other; it is spirit, but an unspiritual consciousness. The first step towards reaching a spiritual consciousness is the negative one of acquiring freedom for one's consciousness. For since perception attempts to prove individual laws, it proceeds from a determination to which, as a universal basis, particular duty is submitted; but this basis is itself not absolute, and falls under the same dialectic. For example, were moderation commanded as a duty on the ground that intemperance undermined the health, health is the ultimate which is here considered as absolute; but it is at the same time not absolute, for there are other duties which ordain that health, and even life itself, should be risked and sacrificed. The so-called conflict of duties is nothing but duty, which is expressed as absolute, showing itself as not absolute; in the constant contradiction morals become unsettled. For a consciousness which has become consistent, law, because it has then been brought into contact with its opposite, has been sublated. For the positive truth has not yet become known in its determination. But to

know the universal in its determination, *i.e.* the limitation of the universal which comes to us as fixed and not contingent, is only possible in connection with the whole system of actuality. Thus if with Socrates the content has become spiritualized, yet manifold independent grounds have merely taken the place of manifold laws. For the perception is not yet expressed as the real perception of these grounds over which it rules; but the truth of consciousness simply is this very movement of pure perception. The true ground is, however, spirit, and the spirit of the people — a perception of the constitution of a people, and the connection of the individual with this real universal spirit. Laws, morals, the actual social life, thus have in themselves their own corrective against the inconsistent, which consists of the expression of a definite content as absolute. In ordinary life we merely forget this limitation of universal principles, and these still hold their place with us; but the other point of view is thus when the limitation comes before our consciousness.

When we have the perfect consciousness that in actual life fixed duties and actions do not exist, for each concrete case is really a conflict of many duties which separate themselves in the moral understanding, but which mind treats as not absolute, comprehending them in the unity of its judgment, we call this pure, deciding individuality, the knowledge of what is right, or conscience, just as we call the pure universal of consciousness not a particular but an all-comprehensive one, duty. Now both sides here present, the universal law and the deciding spirit which is in its abstraction the active individual, are also necessary to the consciousness of Socrates as the content and the power over this content. That is, because with Socrates the particular law has become vacillating, there now comes in the place of the universal single mind, which, with the Greeks, was unconscious determination through unreflective morality, individual mind as individuality deciding for itself. Thus with Socrates the deciding spirit is

transformed into the subjective consciousness of man, since the power of deciding originates with himself; and the first question now is, how this subjectivity appears in Socrates himself. Because the person, the individual, now gives the decision, we come back to Socrates as person, as subject, and what follows is a development of his personal relations. But since the moral element is generally placed in the personality of Socrates, we see the contingent nature of the instruction and of the culture which was obtained through Socrates' character; for it was the actual basis on which men fortified themselves in associating with Socrates, by actual communication with him and by their manner of life. Thus it was true that "the intercourse with his friends was, on the whole, beneficial and instructive to them, but in many cases they became unfaithful to Socrates,"[129] because not everyone attains to perception, and he who possesses it may remain at the negative. The education of the citizens, life in the people, is quite a fresh force in the individual, and does not mean that he educates himself through arguments; hence, however truly educative the intercourse with Socrates was, this contingency still entered into it. We thus see as an unhappy symptom of disorder, how Socrates' greatest favourites, and those endowed with the most genial natures (such as Alcibiades, that genius of levity, who played with the Athenian people, and Critias, the most active of the Thirty) afterwards experienced the fate of being judged in their own country, one as an enemy and traitor to his fellows, and the other as an oppressor and tyrant of the State. They lived according to the principle of subjective perception, and thus cast a bad light on Socrates, for it is shown in this how the Socratic principle in another form brought about the ruin of Greek life.[130]

c. The characteristic form in which this subjectivity — this implicit and deciding certainty — appears in Socrates, has still to be mentioned. That is, since everyone here has this personal mind which appears to him to be his mind, we see how in connection with this, we have what is known under the

name of the Genius (*δαιμόνιον*) of Socrates; for it implies that now man decides in accordance with his perception and by himself. But in this Genius of Socrates — notorious as a much discussed *bizarrerie* of his imagination — we are neither to imagine the existence of protective spirit, angel, and such-like, nor even of conscience. For conscience is the idea of universal individuality, of the mind certain of itself, which is at the same time universal truth. But the Genius of Socrates is rather all the other and necessary sides of his universality, that is, the individuality of mind which came to consciousness in him equally with the former. His pure consciousness stands over both sides. The deficiency in the universal, which lies in its indeterminateness, is unsatisfactorily supplied in an individual way, because Socrates' judgment, as coming from himself, was characterized by the form of an unconscious impulse. The Genius of Socrates is not Socrates himself, not his opinions and conviction, but an oracle which, however, is not external, but is subjective, his oracle. It bore the form of a knowledge which was directly associated with a condition of unconsciousness; it was a knowledge which may also appear under other conditions as a magnetic state. It may happen that at death, in illness and catalepsy, men know about circumstances future or present, which, in the understood relations of things, are altogether unknown. These are facts which are usually rudely denied. That in Socrates we should discover what comes to pass through reflection in the form of the unconscious, makes it appear to be an exceptional matter, revealed to the individual only, and not as being what it is in truth. Thereby it certainly receives the stamp of imagination, but there is nothing more of what is visionary or superstitious to be seen in it, for it is a necessary manifestation, though Socrates did not recognize the necessity, this element being only generally before his imagination.

In connection with what follows, we must yet further consider the relationship of the Genius to the earlier existent form of decision, and that into which it led Socrates; regarding both Xenophon expresses himself in his history most distinctly. Because the standpoint of the Greek mind was natural morality, in which man did not yet determine himself, and still less was what we call conscience present, since laws were, in their fundamental principles, regarded as traditional, these last now presented an appearance of being sanctioned by the gods. We know that the Greeks undoubtedly had laws on which to form their judgments, but on the other hand, both in private and public life, immediate decisions had to be made. But in them the Greeks, with all their freedom, did not decide from the subjective will. The general or the people did not take upon themselves to decide as to what was best in the State, nor did the individual do so in the family. For in making these decisions, the Greeks took refuge in oracles, sacrificial animals, soothsayers, or, like the Romans, asked counsel of birds in flight. The general who had to fight a battle was guided in his decision by the entrails of animals, as we often find in Xenophon's Anabasis. Pausanias tormented himself thus a whole day long before he gave the command to fight.[131] This element, the fact that the people had not the power of decision but were determined from without, was a real factor in Greek consciousness; and oracles were everywhere essential where man did not yet know himself inwardly as being sufficiently free and independent to take upon himself to decide as we do. This subjective freedom, which was not yet present with the Greeks, is what we mean in the present day when we speak of freedom; in the Platonic Republic we shall see more of it. Our responsibility for what we do is a characteristic of modern times; we wish to decide according to grounds of common sense, and consider this as ultimate. The Greeks did not possess the knowledge of this infinitude.

In the first book of Xenophon's Memorabilia (chap. I, §§ 7-9), on the occasion of the defence by Socrates of his *δαιμόνιον*, Socrates says at the very beginning: "The gods have reserved to themselves what is most important in knowledge. Architecture, agriculture, forging, are human arts, as also government, the science of law, management of the household and generalship. In all this man can attain to skill, but for the other, divination is necessary. He who cultivates a field does not know who will enjoy the fruit, nor does he who builds a house know who will inhabit it; the general does not know whether the army should be brought into the field; he who rules a State whether it is good for him" (the individual) "or bad. Nor does he who marries a wife know whether he will experience happiness or whether grief and sorrow will not come through this to him; neither can he who has powerful relations in the State, know whether, on account of these, he may not be banished from the State. Because of this uncertainty, men have to take refuge in divination." Regarding it Xenophon expresses himself (ibid. §§ 3, 4) to the effect that it manifests itself in different ways through oracles, sacrifices, flight of birds, &c., but to Socrates this oracle is his Genius. To hold the future, or what is foreseen by the somnambulist or at death to be a higher kind of insight, is a perversion which easily arises even in our ideas; but looked at more closely, we find in this the particular interests of individuals merely, and the knowledge of what is right and moral is something much higher. If anyone wishes to marry or to build a house, &c., the result is important to the individual only. The truly divine and universal is the institution of agriculture, the state, marriage, &c.; compared to this it is a trivial matter to know whether, when I go to sea, I shall perish or not. The Genius of Socrates moreover reveals itself in him through nothing other than the counsel given respecting these particular issues, such as when and whether his friends ought to travel. To anything true, existing in and for itself in art and science, he made no reference, for

this pertains to the universal mind, and these dæmonic revelations are thus much more unimportant than those of his thinking mind. There is certainly something universal in them, since a wise man can often foresee whether anything is advisable or not. But what is truly divine pertains to all, and though talents and genius are also personal characteristics, they find their first truth in their works which are universal.

Now because with Socrates judgment from within first begins to break free from the external oracle, it was requisite that this return into itself should, in its first commencement, still appear in physiological guise (*supra*, pp. 390, 391). The Genius of Socrates stands midway between the externality of the oracle and the pure inwardness of the mind; it is inward, but it is also presented as a personal genius, separate from human will, and not yet as the wisdom and free will of Socrates himself. The further investigation of this Genius consequently presents to us a form which passes into somnambulism, into this double of consciousness; and in Socrates there clearly appears to be something of the kind, or something which is magnetic, for, as we already mentioned (p. 390), he is said often to have fallen into trances and catalepsy. In modern times we have seen this in the form of a rigid eye, an inward knowledge, perception of this thing and that, of what is gone, of what is best to do, &c.; but magnetism carries science no further than this. The Genius of Socrates is thus to be taken as an actual state, and is remarkable because it is not morbid but was necessarily called up through a special condition of his consciousness. For the turning point in the whole world-famed change of views constituting the principle of Socrates, is that in place of the oracle, the testimony of the mind of the individual has been brought forward and that the subject has taken upon itself to decide.

3. *The Fate of Socrates.* With this Genius of Socrates as one of the chief points of his indictment, we now enter upon the subject of his fate, which

ends with his condemnation. We may find this fate out of harmony with his professed business of instructing his fellow-citizens in what is good, but taken in connection with what Socrates and his people were, we shall recognize the necessity of it. The contemporaries of Socrates, who came forward as his accusers before the Athenian people, laid hold on him as the man who made known that what was held as absolute was not absolute. Socrates, with this new principle, and as one who was an Athenian citizen whose express business was this form of instruction, came, through this his personality, into relationship with the whole Athenian people; and this relationship was not merely with a certain number or with a commanding number, but it was a living relationship with the spirit of the Athenian people. The spirit of this people in itself, its constitution, its whole life, rested, however, on a moral ground, on religion, and could not exist without this absolutely secure basis. Thus because Socrates makes the truth rest on the judgment of inward consciousness, he enters upon a struggle with the Athenian people as to what is right and true. His accusation was therefore just, and we have to consider this accusation as also the end of his career. The attacks which Socrates experienced are well known, and were from two sources; Aristophanes attacked him in the "Clouds," and then he was formally accused before the people.

Aristophanes regarded the Socratic philosophy from the negative side, maintaining that through the cultivation of reflecting consciousness, the idea of law had been shaken, and we cannot question the justice of this conception. Aristophanes' consciousness of the one-sidedness of Socrates may be regarded as a prelude to his death; the Athenian people likewise certainly recognized his negative methods in condemning him. It is known that Aristophanes brought upon the stage along with Socrates, not only such men as Aeschylus, and more specially Euripides, but also the Athenians generally and their generals — the personified Athenian people and the

gods themselves — a freedom which we would not dream of were it not historically authenticated. We have not here to consider the real nature of the Comedy of Aristophanes, nor the wanton way in which he was said to have treated Socrates. As to the first, it should not startle us, nor do we require to justify Aristophanes or to excuse him. The Comedy of Aristophanes is in itself as real a part of the Athenian people, and Aristophanes is as essential a figure, as were the sublime Pericles, the happy Alcibiades, the divine Sophocles, and the moral Socrates, for he belongs as much as any other to this circle of luminaries (Vol. I., p. 322). Thus much can alone be said, that it certainly goes against our German seriousness to see how Aristophanes brings on the boards men living in the State, by name, in order to make a jest of them; and we feel this specially in regard to so upright a man as Socrates.

By chronological considerations, some have tried hard to refute the fact that Aristophanes' representations had no influence on the condemnation of Socrates. It is seen that, on the one hand, Socrates was treated quite unjustly; but then we must recognize the merit of Aristophanes, who in his "Clouds" was perfectly right. This poet, who exposed Socrates to scorn in the most laughable and bitter way, was thus no ordinary joker and shallow wag who mocked what is highest and best, and sacrificed all to wit with a view to making the Athenians laugh. For everything has to him a much deeper basis, and in all his jokes there lies a depth of seriousness. He did not wish merely to mock; and moreover to mock what was worthy of honour would be perfectly bald and flat. It is a pitiful wit which has no substance, and does not rest on contradictions lying in the matter itself. But Aristophanes was no bad jester. It is, generally speaking, not possible to joke in an external way about what does not contain matter for joking or irony in itself. For what really is comic is to show a man or a thing as they disclose themselves in their extent; and if the thing is not itself its

contradiction, the comic element is superficial and groundless. Hence, when Aristophanes makes merry over the Democracy, there is a deep political earnestness at heart, and from all his works it appears what a noble, excellent, true Athenian citizen he was. We thus have a real patriot before us, who, though it involved the punishment of death, did not fear in one of his works to counsel peace. In him, as one who had a patriotism of the most enlightened kind, we find the blissful self-satisfied enjoyment of a people giving free rein to itself. There is, in what is humorous, a self-security which, though with all seriousness it strives after some particular thing, while the opposite of what it aims at always comes to pass, never has for that reason any doubts nor any reflection about itself, since it remains perfectly certain of itself and of what concerns it. We enjoy in Aristophanes this side of the free Athenian spirit, this perfect enjoyment of itself in loss, this untroubled certainty of itself in all miscarriage of the result in real life, and this is the height of humour.

In the "Clouds" we do not indeed see this natural humour, but a contradiction with definite intention. Aristophanes indeed depicts Socrates humorously too, for he brings forth in his moral works the opposite of that from which he starts, and his scholars derive delight from the far-extending discoveries reached through him, which they think are made by their own good luck, but which afterwards turn hateful to them, and become the very opposite of what they intended. The wonderful perception which the followers of Socrates are here represented as having attained, is just a perception of the nullity of the laws of the determinate good as it is to the natural consciousness. Aristophanes made fun of the fact that Socrates occupied himself with elementary researches as to how far fleas spring, and of his putting wax on their feet in order to discover this. This is not historic, but it is well known that Socrates had in his philosophy the side which Aristophanes showed up with such acrimony. Shortly, the fable of the

“Clouds” is this: Strepsiades, an honourable Athenian citizen of the old school, had great trouble with his new-fashioned extravagant son, who, spoiled by mother and uncle, kept horses and led a life out of keeping with his position. The father thus got into trouble with his creditors, and went in distress to Socrates, and became his disciple. There the old man learned that not this or that, but another is the right, or rather he learned the stronger (*κρείττων*) and weaker reasons (*ἕττων λόγος*). He learned the dialectic of laws, and how, by reasoning, the payment of debts can be disregarded, and he then required that his son should go to the School of Socrates; and the latter likewise profited from his wisdom. But we find the result ensuing from the universal which has now through the Socratic dialectic become empty, in the private interest or the wrong spirit of Strepsiades and his son, which spirit is merely the negative consciousness of the content of laws. Equipped with this new wisdom of reasons, and the discovery of reasons, Strepsiades is armed against the chief evil that presses on him, as regards his threatening creditors. These now come one after another to obtain payment. But Strepsiades knows how to put them off with excellent reasons, and to argue them away, for he pacifies them by all sorts of *titulos*, and shows them that he does not need to pay them; indeed he even mocks them, and is very glad that he learned all this from Socrates. But soon the scene changes, and the whole affair alters. The son comes, behaves in a very unseemly way to his father, and finally beats him. The father cries to the supreme power, as if this were the last indignity, but the son shows him, with equally good reasons, obtained by the method derived by him from Socrates, that he had a perfect right to strike him. Strepsiades ends the comedy with execrations on the Socratic dialectic, with a return to his old ways, and with the burning of Socrates’ house. The exaggeration which may be ascribed to Aristophanes, is that he drove this dialectic to its bitter end, but it cannot be said that injustice is done to Socrates by this

representation. Indeed we must admire the depth of Aristophanes in having recognized the dialectic side in Socrates as being a negative, and — though after his own way — in having presented it so forcibly. For the power of judging in Socrates' method is always placed in the subject, in conscience, but where this is bad, the story of Strepsiades must repeat itself.

With regard to the formal public accusation of Socrates, we must not, like Tennemann (Vol. II., p. 39 seq.), say of Socrates' treatment, that "it is revolting to humanity that this excellent man had to drink the cup of poison as a sacrifice to cabals — so numerous in democracies. A man like Socrates, who had made right" (right is not being discussed, but we may ask what right? The right of moral freedom) "the sole standard of his action, and did not stray from the straight path, must necessarily make many enemies" (Why? This is foolish; it is a moral hypocrisy to pretend to be better than others who are then called enemies) "who are accustomed to act from quite different motives. When we think of the corruption, and of the rule of the thirty tyrants, we must simply wonder that he could have worked on to his sixtieth year unmolested. But since the Thirty did not venture to lay hands on him themselves, it is the more to be wondered at that in the reconstituted and just rule and freedom which followed the overthrow of despotism" — in that very way the danger in which their principle was, came to be known— "a man like Socrates could be made a sacrifice to cabals. This phenomenon is probably explained by the fact that the enemies of Socrates had first of all to gain time in order to obtain a following, and that under the rule of the Thirty, they played too insignificant a part," and so on.

Now, as regards the trial of Socrates, we have to distinguish two points, the one the matter of the accusation, the judgment of the court, and the other the relation of Socrates to the sovereign people. In the course of justice

there are thus these two parts — the relation of the accused to the matter on account of which he is accused, and his relation to the competency of the people, or the recognition of their majesty. Socrates was found guilty by the judges in respect of the content of his accusation, but was condemned to death because he refused to recognize the competency and majesty of the people as regards the accused.

a. The accusation consisted of two points: "That Socrates did not consider as gods those who were held to be such by the Athenian people, but introduced new ones; and that he also led young men astray."[132] The leading away of youth was his casting doubt on what was held to be immediate truth. The first accusation has in part the same foundation, for he made it evident that what was usually so considered, was not acceptable to the gods; and in part it is to be taken in connection with his Dæmon, not that he called this his god. But with the Greeks this was the direction which the individuality of judgment took; they took it to be a contingency of the individual, and hence, as contingency of circumstances is an external, they also made the contingency of judgment into something external, *i.e.* they consulted their oracles — conscious that the individual will is itself a contingent. But Socrates, who placed the contingency of judgment in himself, since he had his Dæmon in his own consciousness, thereby abolished the external universal Dæmon from which the Greeks obtained their judgments. This accusation, as also Socrates' defence, we wish now to examine further; Xenophon represents both to us, and Plato has also supplied us with an Apology. Meanwhile we may not rest content with saying that Socrates was an excellent man who suffered innocently, &c. (p. 430), for in this accusation it was the popular mind of Athens that rose against the principle which became fatal to him.

α. As regards the first point of the accusation, that Socrates did not honour the national gods, but introduced new ones, Xenophon[133] makes him

answer that he always brought the same sacrifices as others to the public altars, as all his fellow-citizens could see — his accusers likewise. But as to the charge that he introduced new Dæmons, in that he heard the voice of God showing him what he should do, he appealed to them whether by soothsayers the cry and flight of birds, the utterances of men (like the voice of Pythia), the position of the entrails of sacrificial animals, and even thunder and lightning were not accepted as divine revelations. That God knows the future beforehand, and, if He wishes, reveals it in these ways, all believe with him; but God can also reveal the future otherwise. He could show that he did not lie in maintaining that he heard the voice of God, from the testimony of his friends, to whom he often announced what was said; and in its results this was always found to be true. Xenophon (Memorab. I. c. 1, § 11) adds, "No one ever saw or heard Socrates do or say anything godless or impious, for he never tried to find out the nature of the Universe, like most of the others, when they sought to understand how what the Sophists called the world began." That is, from them came the earlier atheists, who, like Anaxagoras, held that the sun was a stone.[134]

The effect which the defence against this part of the accusation made on the judges is expressed thus by Xenophon:[135] "One section of them was displeased because they did not believe what Socrates said, and the other part because they were envious that he was more highly honoured of the gods than they." This effect is very natural. In our times this also happens in two ways. Either the individual is not believed when he boasts of special manifestations, and particularly of manifestations which have to do with individual action and life; it is neither believed that such manifestations took place at all, or that they happened to this subject. Or if anyone does have dealings with such divinations, rightly enough his proceedings are put an end to, and he is shut up. By this it is not denied in a general way that God foreknows everything, or that He can make revelations to individuals;

this may be admitted *in abstracto*, but not in actuality, and it is believed in no individual cases. Men do not believe that to him, to this individual, there has been a revelation. For why to him more than to others? And why just this trifle, some quite personal circumstances — as to whether someone should have a successful journey, or whether he should converse with another person, or whether or not he should in a speech properly defend himself? And why not others amongst the infinitely many things which may occur to the individual? Why not much more important things, things concerning the welfare of whole States? Hence it is not believed of an individual, in spite of the fact that if it is possible, it must be to the individual that it happens. This unbelief, which thus does not deny the general fact and general possibility, but believes it in no particular case, really does not believe in the actuality and truth of the thing. It does not believe it because the absolute consciousness — and it must be such — certainly knows nothing of a positive kind of trivialities such as form the subject of these divinations and also those of Socrates; in spirit such things immediately vanish away. The absolute consciousness does not know about the future as such, any more than about the past; it knows only about the present. But because in its present, in its thought, the opposition of future and past to present becomes apparent, it likewise knows about future and past, but of the past as something which has taken shape. For the past is the preservation of the present as reality, but the future is the opposite of this, the Becoming of the present as possibility, and thus the formless. From out of this formlessness the universal first comes into form in the present; and hence in the future no form can be perceived. Men have the dim feeling that when God acts it is not in a particular way, nor for particular objects. Such things are held to be too paltry to be revealed by God in a particular case. It is acknowledged that God determines the individual, but by this the totality

of individuality, or all individualities, is understood; hence it is said that God's way of working is found in universal nature.

Now while with the Greeks judgment had the form of a contingency externally posited through the flight and cries of birds, in our culture we decide by an inward contingency, because I myself desire to be this contingency, and the knowledge of individuality is likewise a consciousness of this contingency. But if the Greeks, for whom the category of the contingency of consciousness was an existent, a knowledge of it as an oracle, had this individuality as a universal knowledge of which everyone could ask counsel, in Socrates — in whom what was here externally established had become inward consciousness, as with us, though not yet fully, being still represented as an actual voice, and conceived of as something which he separated from his individuality — the decision of the single individual had the form of personality as a particular, and it was not a universal individuality. This his judges could not in justice tolerate, whether they believed it or not. With the Greeks such revelations had to have a certain nature and method; there were, so to speak, official oracles (not subjective), such as Pythia, a tree, etc. Hence when this appeared in any particular person like a common citizen, it was considered incredible and wrong; the Dæmon of Socrates was a medium of a different kind to any formerly respected in the Greek Religion. It is so much the more noteworthy, that nevertheless the oracle of the Delphian Apollo, Pythia, declared Socrates to be the wisest Greek.[136] Socrates it was who carried out the command of the God of knowledge, "Know Thyself," and made it the motto of the Greeks, calling it the law of the mind, and not interpreting it as meaning a mere acquaintanceship with the particular nature of man. Thus Socrates is the hero who established in the place of the Delphic oracle, the principle that man must look within himself to know what is Truth. Now seeing that Pythia herself pronounced that utterance, we find in it a

complete revolution in the Greek mind, and the fact that in place of the oracle, the personal self-consciousness of every thinking man has come into play. This inward certainty, however, is undoubtedly another new god, and not the god of the Athenians existing hitherto, and thus the accusation of Socrates was quite just.

β. If we now consider the second point of the accusation, that Socrates led youth astray, we find that he first sets against it the fact that the oracle of Delphi declared that none could be nobler, juster or wiser than he.[137] And then he sets against this accusation his whole manner of life, and asks whether by the example that he gave, particularly to those with whom he went about, he ever led any into evil.[138] The general accusation had to be further defined and witnesses came forward. "Melitus said that he knew some whom he advised to obey him rather than their parents,"[139] This point of the accusation principally related to Anytus, and since he made it good by sufficient testimony, the point was undoubtedly proved, in accordance with law. Socrates explained himself further on this point when he left the court. For Xenophon tells us (Apol. Socr. §§ 27, 29 — 31) that Anytus was inimical to Socrates, because he said to Anytus, a respected citizen, that he should not bring up his son to the trade of a tanner, but in manner befitting a free man. Anytus was himself a tanner, and although his business was mostly conducted by slaves, it was in itself not ignominious, and Socrates' expression was hence wrong, although, as we have seen (p. 366), quite in the spirit of Greek thought. Socrates added that he had made acquaintance with this son of Anytus and discovered no evil in him, but he prophesied that he would not remain at this servile work to which his father kept him. Nevertheless, because he had no rational person near to look after him, he would come to have evil desires and be brought into dissolute ways. Xenophon added that Socrates' prophecy had come to pass literally, and that the young man gave himself up to drink, and drank day and night,

becoming totally depraved. This can be easily understood, for a man who feels himself to be fit for something better (whether truly so or not) and through this discord in his mind is discontented with the circumstances in which he lives, yet capable of attaining to no other, is led out of this disgust into listlessness, and is thus on the way to the evil courses which so often ruin men. The prediction of Socrates is thus quite natural. (*Supra*, p. 424.)

To this definite accusation that he led sons into disobedience to their parents, Socrates replied by asking the question whether in selecting men for public offices, such as that of general, parents, or those experienced in war, were selected. Similarly in all cases those most skilful in an art or science are picked out. He demanded whether it was not matter of astonishment that he should be brought before a judge because he was preferred to parents by the sons in their aspirations after the highest human good which is to be made a noble man.[140] This reply of Socrates is, on the one hand, quite just, but we see at the same time that we cannot call it exhaustive, for the real point of the accusation is not touched. What his judges found unjust was the intrusion morally of a third into the absolute relation between parents and children. On the whole not much can be said on this point, for all depends on the mode of intervention, and if it is necessary in certain cases, it need not take place generally, and least of all when some private individual takes that liberty. Children must have the feeling of unity with their parents; this is the first immediately moral relationship; every teacher must respect it, keep it pure, and cultivate the sense of being thus connected. Hence when a third person is called into this relation between parents and children, what happens through the new element introduced, is that the children are for their own good prevented from confiding in their parents, and made to think that their parents are bad people who harm them by their intercourse and training; and hence we find this revolting. The worst thing which can happen to children in regard to

their morality and their mind, is that the bond which must ever be held in reverence should become loosened or even severed, thereby causing hatred, disdain, and ill-will. Whoever does this, does injury to morality in its truest form. This unity, this confidence, is the mother's milk of morality on which man is nurtured; the early loss of parents is therefore a great misfortune. The son, like the daughter, must indeed come out of his natural unity with the family and become independent, but the separation must be one which is natural or unforced, and not defiant and disdainful. When a pain like this has found a place in the heart, great strength of mind is required to overcome it and to heal the wound. If we now speak of the example given us by Socrates, he seems, through his intervention, to have made the young man dissatisfied with his position. Anytus' son might, indeed, have found his work generally speaking uncongenial, but it is another thing when such dislike is brought into consciousness and established by the authority of a man such as Socrates. We may very well conjecture that if Socrates had to do with him, he strengthened and developed in him the germ of the feeling of incongruity. Socrates remarked on the subject of his capacities, saying that he was fit for something better, and thus established a feeling of dissatisfaction in the young man, and strengthened his dislike to his father, which thus became the reason of his ruin. Hence this accusation of having destroyed the relationship of parents and children may be regarded as not unfounded, but as perfectly well established. It was also thought very bad in Socrates' case particularly, and made a matter of reproach that he had such followers as Critias and Alcibiades, who brought Athens almost to the brink of ruin (*supra*, p. 421). For when he mixed himself in the education which others gave their children, men were justified in the demand that the result should not belie what he professed to do for the education of youth.

The only question now is, how the people came to take notice of this, and in how far such matters can be objects of legislation and be brought into

court. In our law, as regards the first part of the accusation, divination such as Cagliostro's is illegal, and it would be forbidden as it formerly was by the Inquisition. Respecting the second point, such a moral interference is no doubt more recognized with us, where there is a particular office having this duty laid upon it; but this interference must keep itself general, and dare not go so far as to call forth disobedience to parents, which is the first immoral principle. But should such questions come before the court? This first of all brings up the question of what is the right of the State, and here great laxity is now allowed. Nevertheless, when some professor or preacher attacks a particular religion, the legislature would certainly take notice of it, and it would have a complete right to do so, although there would be an outcry when it did it. There is undoubtedly a limit which in liberty of thought and speech is difficult to define and rests on tacit agreement; but there is a point beyond which we find what is not allowed, such as direct incitement to insurrection. It is indeed said, that "bad principles destroy themselves by themselves and find no entrance." But that is only true in part, for with the populace the eloquence of sophistry stirs up their passions. It is also said, "This is only theoretic, no action follows." But the State really rests on thought, and its existence depends on the sentiments of men, for it is a spiritual and not a physical kingdom. Hence it has in so far maxims and principles which constitute its support, and if these are attacked, the Government must intervene. Added to this, it was the case that in Athens quite a different state of things was present than with us; in order to be able to judge rightly of Socrates' case we must first consider the Athenian State and its customs. According to Athenian laws, *i.e.* according to the spirit of the absolute State, both these things done by Socrates were destructive of this spirit, while in our constitution the universal of the states is a stronger universal, which last undoubtedly permits of individuals having freer play, since they cannot be so dangerous to this universal. Hence it would

undoubtedly in the first place mean the subversion of the Athenian State, if this public religion on which everything was built and without which the State could not subsist, went to pieces; with us the State may be called an absolute and independent power. The Dæmon is now, in fact, a deity differing from any known, and because it stood in contradiction to the public religion, it gave to it a subjective arbitrariness. But since established religion was identified with public life so closely that it constituted a part of public law, the introduction of a new god who formed self-consciousness into a principle and occasioned disobedience, was necessarily a crime. We may dispute with the Athenians about this, but we must allow that they are consistent. In the second place, the moral connection between parents and children is stronger, and much more the moral foundation of life with the Athenians than with us, where subjective freedom reigns; for family piety is the substantial key-note of the Athenian State. Socrates thus attacked and destroyed Athenian life in two fundamental points; the Athenians felt and became conscious of it. Is it then to be wondered at that Socrates was found guilty? We might say that it had to be so. Tennemann (Vol. II., p. 41) says: "Though these charges contained the most palpable untruths, Socrates was condemned to death because his mind was too lofty for him to descend to the common unworthy means, by which the judgment of the court was usually perverted." But all this is false; he was found guilty of these deeds, but not for that reason condemned to death.

b. We here come to the second occurrence in his history. In accordance with Athenian laws, the accused had, after the Heliasts (resembling the English jury) pronounced him guilty, the liberty of suggesting (*ἀντιτιμᾶσθαι*) a penalty different from the punishment which the accuser proposed; this implied a mitigation of the punishment without a formal appeal — an excellent provision in Athenian law, testifying to its humanity. In this penalty the punishment in itself is not brought into question, but only

the kind of punishment; the judges had decided that Socrates deserved punishment. But when it was left to the accused to determine what his punishment should be, it might not be arbitrary, but must be in conformity with the crime, a money or bodily punishment (*ὅ, τι χρὴ παθεῖν ἢ ἀποτῖθαι*).[141] But it was implied in the guilty persons constituting himself his own judge, that he submitted himself to the decision of the court and acknowledged himself to be guilty. Now Socrates declined to assign a punishment for himself consisting either of fine or banishment, and he had the choice between these and death, which his accusers proposed. He declined to choose the former punishment because he, according to Xenophon's account (Apol. Socr. § 23), in the formality of the exchange-penalty (*τὸ ὑποτιμᾶσθαι*), as he said, would acknowledge guilt; but there was no longer any question as to the guilt, but only as to the kind of punishment.

This silence may indeed be considered as moral greatness, but, on the other hand, it contradicts in some measure what Socrates says later on in prison, that he did not wish to flee, but remained there, because it seemed better to the Athenians and better to him to submit to the laws (Vol. I., p. 342). But the first submission would have meant that as the Athenians had found him guilty, he respected this decision, and acknowledged himself as guilty. Consistently he would thus have held it better to impose his punishment, since thereby he would not only have submitted himself to the laws, but also to the judgment. We see in Sophocles (Antig. verses 925, 926), the heavenly Antigone, that noblest of figures that ever appeared on earth, going to her death, her last words merely stating —

"If this seems good unto the gods,
Suffering, we may be made to know our error."

Pericles also submitted himself to the judgment of the people as sovereign; we saw him (Vol. I., p. 328) going round the citizens entreating for Aspasia and Anaxagoras. In the Roman Republic we likewise find the noblest men begging of the citizens. There is nothing dishonouring to the individual in this, for he must bend before the general power, and the real and noblest power is the people. This acknowledgment the people must have direct from those who raise themselves amongst them. Here, on the contrary, Socrates disclaims the submission to, and humiliation before the power of the people, for he did not wish to ask for the remission of his punishment. We admire in him a moral independence which, conscious of its own right, insists upon it and does not bend either to act otherwise, or to recognize as wrong what it itself regards as right. Socrates hence exposed himself to death, which could not be regarded as the punishment for the fault of which he was found guilty; for the fact that he would not himself determine the punishment, and thus disdained the juridical power of the people, was foremost in leading to his condemnation. In a general way he certainly recognized the sovereignty of the people, but not in this individual case; it has, however, to be recognized, not only in general, but in each separate case. With us the competency of the court is presupposed, and the criminal judged without further ado; to-day the whole matter is also open to the light of day and accepted as an acknowledged fact. But with the Athenians we find the characteristic request that the prisoner should, through the act of imposing on himself a penalty, sanction the judge's sentence of guilt. In England this is certainly not the case, but there still remains a like form of asking the accused by what law he wishes to be judged. He then answers, by the law of the land and by the judges of his country. Here we have the recognition of legal operations.

Socrates thus set his conscience in opposition to the judges' sentence, and acquitted himself before its tribunal. But no people, and least of all a

free people like the Athenians, has by this freedom to recognize a tribunal of conscience which knows no consciousness of having fulfilled its duty excepting its own consciousness. To this government and law, the universal spirit of the people, may reply: “If you have the consciousness of having done your duty, we must also have the consciousness that you have so done.” For the first principle of a State is that there is no reason or conscience or righteousness or anything else, higher than what the State recognizes as such. Quakers, Anabaptists, &c., who resist any demands made on them by the State, such as to defend the Fatherland, cannot be tolerated in a true State. This miserable freedom of thinking and believing what men will, is not permitted, nor any such retreat behind personal consciousness of duty. If this consciousness is no mere hypocrisy, in order that what the individual does should be recognized as duty, it must be recognized as such by all. If the people can make mistakes the individual may do so much more easily, and he must be conscious that he can do this much more easily than the people. Now law also has a conscience and has to speak through it; the law-court is the privileged conscience. Now if the miscarriage of justice in a trial is shown by every conscience clamouring for something different, the conscience of the court alone possesses any value as being the universal legalized conscience, which does not require to recognize the particular conscience of the accused. Men are too easily convinced of having fulfilled their duty, but the judge finds out whether duty is in fact fulfilled, even if men have the consciousness of its being so.

We should expect nothing else of Socrates than that he should go to meet his death in the most calm and manly fashion. Plato’s account of the wonderful scene his last hours presented, although containing nothing very special, forms an elevating picture, and will be to us a permanent representation of a noble deed. The last dialogue of Plato is popular philosophy, for the immortality of the soul is here first brought forward; yet

it brings no consolation, for, as Homer makes Achilles say in the nether world, he would prefer to be a ploughboy on the earth.

But though the people of Athens asserted through the execution of this judgment the rights of their law as against the attacks of Socrates, and had punished the injury caused to their moral life by Socrates, Socrates was still the hero who possessed for himself the absolute right of the mind, certain of itself and of the inwardly deciding consciousness, and thus expressed the higher principle of mind with consciousness. Now because, as has been said, this new principle by effecting an entrance into the Greek world, has come into collision with the substantial spirit and the existing sentiments of the Athenian people, a reaction had to take place, for the principle of the Greek world could not yet bear the principle of subjective reflection. The Athenian people were thus, not only justified, but also bound to react against it according to their law, for they regarded this principle as a crime. In general history we find that this is the position of the heroes through whom a new world commences, and whose principle stands in contradiction to what has gone before and disintegrates it: they appear to be violently destroying the laws. Hence individually they are vanquished, but it is only the individual, and not the principle, which is negated in punishment, and the spirit of the Athenian people did not in the removal of the individual, recover its old position. The false form of individuality is taken away, and that, indeed, in a violent way, by punishment; but the principle itself will penetrate later, if in another form, and elevate itself into a form of the world-spirit. This universal mode in which the principle comes forth and permeates the present is the true one; what was wrong was the fact that the principle came forth only as the peculiar possession of one individual. His own world could not comprehend Socrates, but posterity can, in as far as it stands above both. It may be conceived that the life of Socrates had no need to have such an end, for Socrates might have lived and died a private

philosopher, and his teaching might have been quietly accepted by his disciples, and have spread further still without receiving any notice from State or people; the accusation thus would seem to have been contingent. But it must be said that it was through the manner of that event that this principle became so highly honoured. The principle is not merely something new and peculiar to itself, but it is an absolutely essential moment in the self-developing consciousness of self which is designed to bring to pass as a totality, a new and higher actuality. The Athenians perceived correctly that this principle not only meant opinion and doctrine, for its true attitude was that of a direct and even hostile and destructive relation to the actuality of the Greek mind; and they proceeded in accordance with this perception. Hence, what follows in Socrates' life is not contingent, but necessarily follows upon his principle. Or the honour of having recognized that relation, and indeed of having felt that they themselves were tinged with this principle, is due to the Athenians.

c. The Athenians likewise repented of their condemnation of Socrates, and punished some of his accusers with death itself, and others with banishment; for according to Athenian laws, the man who made an accusation, and whose accusation was found to be false, usually underwent the same punishment that otherwise the criminal would have borne. This is the last act in this drama. On the one hand the Athenians recognized through their repentance the individual greatness of the man; but on the other (and this we find by looking closer) they also recognized that this principle in Socrates, signifying the introduction of new gods and disrespect to parents, has — while destructive and hostile to it — been introduced even into their own spirit, and that they themselves are in the dilemma of having in Socrates only condemned their own principle. In that they regretted the just judgment of Socrates, it seems to be implied that they wished that it had not occurred. But from the regret it does not follow that

in itself it should not have occurred, but only that it should not have happened for their consciousness. Both together constitute the innocence which is guilty and atones for its guilt; it would only be senseless and despicable if there were no guilt. An innocent person who comes off badly is a simpleton; hence it is a very flat and uninteresting matter when tyrants and innocent persons are represented in tragedies, just because this is an empty contingency. A great man would be guilty and overcome the great crisis that ensues; Christ thus gave up his individuality, but what was brought forth by him remained.

The fate of Socrates is hence really tragic, not in the superficial sense of the word and as every misfortune is called tragic. The death of an estimable individual must, in such a sense, be specially tragic, and thus it is said of Socrates, that because he was innocent and condemned to death, his fate was tragic. But such innocent suffering would only be sad and not tragic, for it would not be a rational misfortune. Misfortune is only rational when it is brought about by the will of the subject, who must be absolutely justified and moral in what he does, like the power against which he wars — which must therefore not be a merely natural power, or the power of a tyrannic will. For it is only in such a case that man himself has any part in his misfortune, while natural death is only an absolute right which nature exercises over men. Hence, in what is truly tragic there must be valid moral powers on both the sides which come into collision; this was so with Socrates. His is likewise not merely a personal, individually romantic lot; for we have in it the universally moral and tragic fate, the tragedy of Athens, the tragedy of Greece. Two opposed rights come into collision, and the one destroys the other. Thus both suffer loss and yet both are mutually justified; it is not as though the one alone were right and the other wrong. The one power is the divine right, the natural morality whose laws are identical with the will which dwells therein as in its own essence, freely and

nobly; we may call it abstractly objective freedom. The other principle, on the contrary, is the right, as really divine, of consciousness or of subjective freedom; this is the fruit of the tree of the knowledge of good and evil, *i.e.* of self-creative reason; and it is the universal principle of Philosophy for all successive times. It is these two principles which we see coming into opposition in the life and the philosophy of Socrates.

The Athenian people had come into a period of culture, in which this individual consciousness made itself independent of the universal spirit and became for itself. This was perceived by them in Socrates, but at the same time it was felt that it meant ruin, and thus they punished an element which was their own. The principle of Socrates is hence not the transgression of one individual, for all were implicated; the crime was one that the spirit of the people committed against itself. Through this perception the condemnation of Socrates was retracted; Socrates appeared to have committed no crime, for the spirit of the people has now generally reached the consciousness which turns back from the universal into itself. This meant the disintegration of this people, whose mind and spirit consequently soon disappeared from the world, but yet out of its ashes a higher took its rise, for the world-spirit had raised itself into a higher consciousness. The Athenian State, indeed, endured for long, but the bloom of its character soon faded. It is characteristic of Socrates that he grasped the principle of the inwardness of knowledge, not practically merely, as did Critias and Alcibiades (*supra*, pp. 421, 438), but in thought, making it valid to thought, and this is the higher method. Knowledge brought about the Fall, but it also contains the principle of Redemption. Thus what to others was only ruin, to Socrates, because it was the principle of knowledge, was also a principle of healing. The development of this principle, which constitutes the content of all successive history, is explicitly the reason that the later philosophers withdrew from the affairs of the State, restricted themselves to cultivating

an inner world, separated from themselves the universal aim of the moral culture of the people, and took up a position contrary to the spirit of Athens and the Athenians. From this it came to pass that particularity of ends and interests now became powerful in Athens. This has, in common with the Socratic principle, the fact that what seems right and duty, good and useful to the subject in relation to himself as well as to the State, depends on his inward determination and choice, and not on the constitution and the universal. This principle of self-determination for the individual has, however, become the ruin of the Athenian people, because it was not yet identified with the constitution of the people; and thus the higher principle must in every case appear to bring ruin with it where it is not yet identified with the substantial of the people. The Athenian life became weak, and the State outwardly powerless, because its spirit was divided within itself. Hence it was dependent on Lacedæmon, and we finally see the external subordination of these States to the Macedonians.

We are done with Socrates. I have been more detailed here because all the features of the case have been so completely in harmony, and he constitutes a great historic turning point. Socrates died at sixty-nine years of age, in Olympiad 95, 1 (399-400 B.C.), an Olympiad after the end of the Peloponnesian war, twenty-nine years after the death of Pericles, and forty-four years before the birth of Alexander. He saw Athens in its greatness and the beginning of its fall; he experienced the height of its bloom and the beginning of its misfortunes.

C. The Socratics.

THE RESULT OF the death of Socrates was, that the little company of his friends went off from Athens to Megara, where Plato also came. Euclides had settled there and received them gladly.[142] When Socrates' condemnation was retracted and his accusers punished, certain of the Socratics returned, and all was again brought into equilibrium. The work of Socrates was far-reaching and effectual in the kingdom of Thought, and the stimulation of a great amount of interest is always the principal service of a teacher. Subjectively, Socrates had the formal effect of bringing about a discord in the individual; the content was subsequently left to the free-will and liking of each person, because the principle was subjective consciousness and not objective thought. Socrates himself only came so far as to express for consciousness generally the simple existence of one's own thought as the Good, but as to whether the particular conceptions of the Good really properly defined that of which they were intended to express the essence, he did not inquire. But because Socrates made the Good the end of the living man, he made the whole world of idea, or objective existence in general, rest by itself, without seeking to find a passage from the Good, the real essence of what is known as such, to the thing, and recognizing real essence as the essence of things. For when all present speculative philosophy expresses the universal as essence, this, as it first appears, has the semblance of being a single determination, beside which there are a number of others. It is the complete movement of knowledge that first removes this semblance, and the system of the universe then shows forth its essence as Notion, as a connected whole.

The most varied schools and principles proceeded from this doctrine of Socrates, and this was made a reproach against him, but it was really due to the indefiniteness and abstraction of his principle. And in this way it is only particular forms of this principle which can at first be recognized in philosophic systems which we call Socratic. Under the name of Socratic, I understand, however, those schools and methods which remained closer to Socrates and in which we find nothing but the one-sided understanding of Socratic culture. One part of these kept quite faithfully to the direct methods of Socrates, without going any further. A number of his friends are mentioned as being of this description, and these, inasmuch as they were authors, contented themselves with correctly transcribing dialogues after his manner, which were partly those he actually had held with them, and partly those they had heard from others; or else with working out similar dialogues in his method. But for the rest they abstained from speculative research, and by directing their attention to what was practical, adhered firmly and faithfully to the fulfilment of the duties of their position and circumstances, thereby maintaining calm and satisfaction. Xenophon is the most celebrated of those mentioned, but besides him a number of other Socratics wrote dialogues. Æschines, some of whose dialogues have come down to us, Phædo, Antisthenes and others are mentioned, and amongst them a shoemaker, Simon, “with whom Socrates often spoke at his workshop, and who afterwards carefully wrote out what Socrates said to him.” The title of his dialogues, as also those of the others which are left to us, are to be found in Diogenes Laërtius (II. 122, 123; 60, 61; 105; VI. 15-18); they have, however, only a literary interest, and hence I will pass them by.

But another section of the Socratics went further than Socrates, inasmuch as they, starting from him, laid hold of and matured one of the particular aspects of his philosophy and of the standpoint to which philosophic knowledge was brought through him. This standpoint maintained the

absolute character of self-consciousness within itself, and the relation of its self-existent universality to the individual. In Socrates, and from him onward, we thus see knowledge commencing, the world raising itself into the region of conscious thought, and this becoming the object. We no longer hear question and answer as to what Nature is, but as to what Truth is; or real essence has determined itself not to be the implicit, but to be what it is in knowledge. We hence have the question of the relationship of self-conscious thought to real essence coming to the front as what concerns us most. The true and essence are not the same; the true is essence as thought, but essence is the simply implicit. This simple is, indeed, thought, and is in thought, but when it is said that essence is pure Being or Becoming, as the being-for-self of the atomists, and then that the Notion is thought generally (the *νοῦς* of Anaxagoras), or finally measure, this is asserted directly, and in an objective manner. Or it is the simple unity of the objective and of thought; it is not purely objective — for Being cannot be seen, heard, &c.; nor is it pure thought in opposition to the existent — for this is the explicitly existent self-consciousness which separates itself from essence. It is finally not the unity going back into itself from the difference in the two sides, which is understanding and knowledge. In these self-consciousness on the one hand presents itself as being-for-self, and on the other, as Being; it is conscious of this difference, and from this difference turns back into the unity of both. This unity, the result, is the known, the true. One element in the true is the certainty of itself; this moment has attained to reality — in consciousness and for consciousness. It is through this movement and the investigation of the subject, that the succeeding period of Philosophy is distinguished, because it does not contemplate essence as left to itself, and as purely objective, but as in unity with the certainty of itself. It is not to be understood by this that such knowledge had itself been made into essence, so that it is held to be the content and definition of absolute essence, or that

essence had been determined for the consciousness of these philosophers as the unity of Being and Thought, *i.e.* as if they had thought of it thus; but they could merely no longer speak of essence and actuality without this element of self-certainty. And this period is hence, so to speak, the middle period, which is really the movement of knowledge, and considers knowledge as the science of essence, which first brings about that unity.

From what has been said, it can now be seen what philosophic systems can come before us. That is to say, because in this period the relation of Thought to Being, or of the universal to the individual, is made explicit, we see, on the one hand, as the object of Philosophy, the contradiction of consciousness coming to consciousness — a contradiction as to which the ordinary modes of thought have no knowledge, for they are in a state of confusion, seeing that they go on unthinkingly. On the other hand we have Philosophy as perceiving knowledge itself, which, however, does not get beyond its Notion, and which, because it is the unfolding of a more extensive knowledge of a content, cannot give itself this content, but can only think it, *i.e.* determine it in a simple manner. Of those Socratics who hold a place of their own, there are, according to this, three schools worthy of consideration; first the Megaric School, at whose head stands Euclid of Megara, and then the Cyrenaic and Cynic Schools; and from the fact that they all three differ very much from one another, it is clearly shown that Socrates himself was devoid of any positive system. With these Socratics the determination of the subject for which the absolute principle of the true and good likewise appears as end, came into prominence; this end demands reflection and general mental cultivation, and also requires that men should be able to tell what the good and true really are. But though these Socratic schools as a whole rest at saying that the subject itself is end, and reaches its subjective end through the cultivation of its knowledge, the form of determination in them is still the universal, and it is also so that it does not

remain abstract, for the development of the determinations of the universal gives real knowledge. The Megarics were most abstract, because they held to the determination of the good which, as simple, was to them the principle; the unmoved and self-related simplicity of thought becomes the principle of consciousness as individual, as it is of conscious knowledge. The Megaric school associated with the assertion of the simplicity of the good, the dialectic, that all that was defined and limited is not true. But because with the Megarics the principal point was to know the universal, and this universal was to them the Absolute which had to be retained in this form of the universal, this thought, as Notion which holds a negative position in relation to all determinateness and thus to that of Notion also, was equally turned against knowledge and perception.

The Cyrenaics take knowledge in its subjective signification, and as signifying individuality as certainty of self, or feeling; to this as to that which is essential, they restrict the exercise of consciousness, and, generally speaking, make existence for consciousness consist therein. Now because they thereby sought to define the Good more closely, they called it simply pleasure or enjoyment, by which, however, anything can be understood. This principle of the Cyrenaic school would seem to have been far removed from that of Socrates, since we at once think of the transient existence of feeling as directly in opposition to the Good; this, however, is not the case. The Cyrenaics likewise upheld the universal, for, if it is asked what the Good is, we find they certainly made pleasurable feeling, which presents the appearance of a determinate, to be its content, but seeing that a cultured mind is also requisite, enjoyment, as it is obtained through thought, is here indicated.

The Cynics also further defined the principle of the Good, but in another way from the Cyrenaics; its content, they said, lay in man's keeping to what is in conformity with nature and to the simple needs of nature. They

similarly call all that is particular and limited in the aims of men that which is not to be desired. To the Cynics, too, mental culture through the knowledge of the universal is the principle; but through this knowledge of the universal the individual end must be attained, and this is, that the individual should keep himself in abstract universality, in freedom and independence, and be indifferent to all he formerly esteemed. Thus we see pure thought recognized in its movement with the individual, and the manifold transformations of the universal coming to consciousness. These three schools are not to be treated at length. The principle of the Cyrenaics became later on more scientifically worked out in Epicureanism, as that of the Cynics did in Stoicism.

1. The Megarics.

Because Euclides (who is regarded as the founder of the Megaric way of thinking) and his school held to the forms of universality, and, above all, sought, and with success, to show forth the contradictions contained in all particular conceptions, they were reproached with having a rage for disputation, and hence the name of Eristics was given them. The instrument for bringing all that is particular into confusion and annulling this particular, was supplied by dialectic, which, indeed, was brought by them to very great perfection, but, as was privately stated, they did it in a kind of anger, so that others said that they should not be called a School (*σχολή*) but a gall (χολή).[143] With a dialectic thus constituted, we find them taking the place of the Eleatic School and of the Sophists; and it seems as though the Eleatic School had merely been reproduced,[144] since they were essentially identical with it. But this was only partly true — in that the Eleatic dialecticians maintained Being as the one existence in relation to which nothing particular is a truth, and the Megarics considered Being as the Good. The Sophists, on the other hand, did not seek their impulse in simple

universality as fixed and as enduring; and similarly we shall find in the Sceptics, dialecticians who maintain that the subjective mind rests within itself. Besides Euclides, Diodorus and Menedemus are mentioned as distinguished Eristics, but particularly Eubulides, and later on Stilpo, whose dialectic likewise related to contradictions which appeared in external conception and in speech, so that it in great measure passed into a mere play upon words.

a. Euclides.

Euclides, who is not to be confused with the mathematician, is he of whom it is said that during the enmity between Athens and his birthplace, Megara, and in the period of most violent animosity, he often secretly went to Athens, dressed as a woman, not fearing even the punishment of death in order to be able to hear Socrates and be in his company.[145] Euclides is said, in spite of his stubborn manner of disputing, to have been, even in his disputation, a most peaceful man. It is told that once in a quarrel his opponent was so irritated, that he exclaimed, "I will die if I do not revenge myself upon you!" Euclides replied, "And I will die if I do not soften your wrath so much by the mildness of my speech that you will love me as before."[146] It was Euclides who said that "the Good is one," and it alone is, "though passing under many names; sometimes it is called Understanding, sometimes God; at another time Thought (*νοῦς*), and so on. But what is opposed to the good does not exist."[147] This doctrine Cicero (*ibid.*) calls noble, and says that it differs but little from the Platonic. Since the Megarics make the Good, as the simple identity of the true, into a principle, it is clearly seen that they expressed the Good as the absolute existence in a universal sense, as did Socrates; but they no longer, like him, recognized all the approximate conceptions, or merely opposed them as being indifferent to the interests of man, for they asserted definitely that they were nothing at

all. Thus they come into the category of the Eleatics, since they, like them, showed that only Being is, and that all else, as negative, does not exist. While the dialectic of Socrates was thus incidental, in that he merely shook some current moral ideas, or the very first conceptions of knowledge, the Megarics, on the contrary, raised their philosophic dialectic into something more universal and real, for they applied themselves more to what is formal in idea and speech, though not yet, like the later Sceptics, to the determinations of pure Notions; for knowledge, thought, was not yet present in abstract conceptions. Of their own dialectic not much is told, but more is said of the embarrassment into which they brought ordinary consciousness, for they were in all kinds of ways alert in involving others in contradictions. Thus they applied dialectic after the manner of an ordinary conversation, just as Socrates applied his mind to every side of ordinary subjects, and as we also, in our conversation, try to make an assertion interesting and important. A number of anecdotes are told of their disputations, from which we see that what we call joking was their express business. Others of their puzzles certainly deal with a positive category of thought; they take these and show how, if they are held to be true, they bring about a contradiction.

b. Eubulides.

Of the innumerable multitude of ways in which they tried to confuse our knowledge in the categories, many are preserved with their names, and the principal of these are the Sophisms, whose discovery is ascribed to Eubulides of Miletus, a pupil of Euclides.[148] The first thing which strikes us when we hear them is that they are common sophisms which are not worth contradiction, and scarcely of being heard, least of all have they a real scientific value. Hence we call them stupid, and look at them as dreary jokes, but it is in fact easier to set them aside than to refute them. We let ordinary speech pass, and are content with it, so long as everyone knows

what the other means (when this is not so — we trust that God understands us), but these sophisms seem in a way to mislead common speech, for they show the contradictory and unsatisfactory nature of it when taken strictly as it is spoken. To confuse ordinary language so that we do not know how to reply, seems foolish, as leading to formal contradictions, and if it is done we are blamed for taking mere empty words and playing upon them. Our German seriousness, therefore, dismisses this play on words as shallow wit, but the Greeks honoured the word in itself, and the mere treatment of a proposition as well as the matter. And if word and thing are in opposition, the word is the higher, for the unexpressed thing is really irrational, since the rational exists as speech alone.

It is in Aristotle, and in his Sophistical Elenchi that we first find numerous examples of these contradictions (coming from the old Sophists equally with the Eristics), and also their solutions. Eubulides, therefore, likewise wrote against Aristotle,[149] but none of this has come down to us. In Plato we also find, as we saw before (p. 370), similar jokes and ambiguities mentioned to make the Sophists ridiculous, and to show with what insignificant matters they took up their time. The Eristics went yet further, for they, like Diodorus, became jesters to courts, such as to that of the Ptolemies.[150] From historic facts we see that this dialectic operation of confusing others and showing how to extricate them again was a general amusement of the Greek philosophers, both in public places and at the tables of kings. Just as the Queen of the East came to Solomon to put riddles to him, we find at the tables of kings witty conversation and assemblages of philosophers joking and making merry over one another. The Greeks were quite enamoured of discovering contradictions met with in speech and in ordinary ideas. The contradiction does not make its appearance as a pure contradiction in the conception, but only as interwoven with concrete ideas; such propositions neither apply to the

concrete content nor to the pure Notion. Subject and predicate, of which every proposition consists, are different, but in the ordinary idea we signify their unity; this simple unity, which does not contradict itself, is to ordinary ideas the truth. But in fact, the simple self-identical proposition is an unmeaning tautology; for in any affirmation, differences are present, and because their diversity comes to consciousness, there is contradiction. But the ordinary consciousness is then at an end, for only where there is a contradiction is there the solution, self-abrogation. Ordinary consciousness has not the conception that only the unity of opposites is the truth — that in every statement there is truth and falsehood, if truth is to be taken in the sense of the simple, and falsehood in the sense of the opposed and contradictory; in it the positive, the first unity, and the negative, this last opposition, fall asunder.

In Eubulides' propositions the main point was that because the truth is simple, a simple answer is required; that thus the answer should not, as happened in Aristotle (De Sophist. Elench. c. 24), have regard to certain special considerations; and, after all, this is really the demand of the understanding. Thus the mistake is to desire an answer of yes or no, for since no one ventures on either, perplexity ensues, because it is a fool's part not to know what to reply. The simplicity of the truth is thus grasped as the principle. With us this appears in the form of making such statements as that one of opposites is true, the other false; that a statement is either true or not true; that an object cannot have two opposite predicates. That is the first principle of the understanding, the *principium exclusi tertii*, which is of great importance in all the sciences. This stands in close connection with the principle of Socrates and Plato (*supra*, pp. 455, 456), "The true is the universal;" which is abstractly the identity of understanding, according to which what is said to be true cannot contradict itself. This comes more clearly to light in Stilpo (p. 464). The Megarics thus kept to this principle of

our logic of the understanding, in demanding the form of identity for the Truth. Now in the cases that they put, they did not keep to the universal, but sought examples in ordinary conception, by means of which they perplexed people; and this they formed into a kind of system. We shall bring forward some examples that are preserved to us; some are more important, but others are insignificant.

α. One Elench was called the Liar (*ψευδόμενος*); in it the question is put: "If a man acknowledges that he lies, does he lie or speak the truth?"[151] A simple answer is demanded, for the simple whereby the other is excluded, is held to be the true. If it is said that he tells the truth, this contradicts the content of his utterance, for he confesses that he lies. But if it is asserted that he lies, it may be objected that his confession is the truth. He thus both lies and does not lie; but a simple answer cannot be given to the question raised. For here we have a union of two opposites, lying and truth, and their immediate contradiction; in different forms this has at all times come to pass, and has ever occupied the attention of men. Chrysippus, a celebrated Stoic, wrote six books on the subject,[152] and another, Philetas of Cos, died in the decline which he contracted through over-study of these paradoxes.[153] We have the same thing over again when, in modern times, we see men worn out by absorbing themselves in the squaring of the circle — a proposition which has well nigh become immortal. They seek a simple relation from something incommensurable, *i.e.* they fall into the error of demanding a simple reply where the content is contradictory. That little history has perpetuated and reproduced itself later on; in Don Quixote the very same thing appears. Sancho, governor of the island of Barataria, was tested by many insidious cases as he sat in judgment, and, amongst others, with the following: In his domain there was a bridge which a rich man had erected for the good of passengers — but with a gallows close by. The crossing of the bridge was restricted by the condition that everyone must

say truly where he was going, and if he lied, he would be hung upon the gallows. Now one man came to the bridge, and to the question whither he went, answered that he had come here to be hung on the gallows. The bridge-keepers were much puzzled by this. For if they hanged him, he would have spoken the truth and ought to have passed, but if he crossed he would have spoken an untruth. In this difficulty they applied to the wisdom of the governor, who uttered the wise saying that in such dubious cases the mildest measures should be adopted, and thus the man should be allowed to pass. Sancho did not break his head over the matter. The result which the statement was to have, is made its content, with the condition that the opposite of the content should be the consequence. Hanging, understanding it to be truly expressed, should not have hanging as result; non-hanging as an event, should, on the other hand, have hanging as result. Thus death is made the consequence of suicide, but by suicide death itself is made into the content of the crime, and cannot thus be the punishment.

I will give another similar example along with the answer. Menedemus was asked whether he had ceased to beat his father. This was an attempt to place him in a difficulty, since to answer either yes or no, would be equally risky. For if he said 'yes,' then he once beat him, and if 'no,' then he still beats him. Menedemus hence replied that he neither ceased to beat him, nor had beaten him; and with this his opponents were not satisfied.[154] Through this answer, which is two-sided, the one alternative, as well as the other, being set aside, the question is in fact answered; and this is also so in the former question as to whether the man spoke truly who said he lied, when the reply is made, "He speaks the truth and lies at the same time, and the truth is this contradiction." But a contradiction is not the true, and cannot enter into our ordinary conceptions; hence Sancho Panza likewise set it aside in his judgment. If the consciousness of opposition is present, our ordinary ideas keep the contradictory sides apart; but in fact the

contradiction appears in sensuous things, such as space, time, &c., and has in them only to be demonstrated. These sophisms thus not only appear to be contradictory, but are so in truth: this choice between two opposites, which is set before us in the example, is itself a contradiction.

β. The Concealed one (*διαλανθάνων*) and the Electra[155] proceed from the contradiction of knowing and not knowing someone at the same time. I ask someone 'Do you know your father?' He replies 'Yes.' I then ask 'Now if I show you someone hidden behind a screen, will you know him?' 'No.' 'But it is your father, and thus you do not know your father.' It is the same in the Electra. 'Can it be said that she knows her brother Orestes who stands before her or not?' These twists and turns seem superficial, but it is interesting to consider them further. (*αα*) To know means, on the one hand, to have someone as 'this one,' and not vaguely and in general. The son thus knows his father when he sees him, *i.e.* when he is a 'this' for him; but hidden, he is not a 'this' for him, but a 'this' abrogated. The hidden one as a 'this' in ordinary conception, becomes a general, and loses his sensuous being, thereby is in fact not a true 'this.' The contradiction that the son both knows and does not know his father, thus becomes dissolved through the further qualification that the son knows the father as a sensuous 'this,' and not as a 'this' of idea. (*ββ*) On the other hand Electra knows Orestes, not as a sensuous 'this,' but in her own idea; the 'this' of idea and the 'this' here, are not the same to her. In this way there enters into these histories the higher opposition of the universal and of the 'this,' in as far as to have in the ordinary idea, means in the element of the universal; the abrogated 'this' is not only an idea, but has its truth in the universal. The universal is thus found in the unity of opposites, and thus it is in this development of Philosophy the true existence, in which the sensuous being of the 'this' is negated. It is the consciousness of this in particular which, as we shall soon see (p. 465), is indicated by Stilpo.

γ. Other quibbles of the same kind have more meaning, like the arguments which are called the Sorites (*σωρείτης*) and the Bald (*φαλακρός*).[156] Both are related to the false infinite, and the quantitative progression which can reach no qualitative opposite, and yet at the end finds itself at a qualitative absolute opposite. The Bald head is the reverse of the problem of the Sorites. It is asked, "Does one grain of corn make a heap, or does one hair less make a bald head?" The reply is "No." "Nor one again?" "No, it does not." This question is now always repeated while a grain is always added, or a hair taken away. When at last it is said that there is a heap or a bald head, it is found that the last added grain or last abstracted hair has made the heap or the baldness, and this was at first denied. But how can a grain form a heap which already consists of so many grains? The assertion is that one grain does not make a heap; the contradiction, that one thus added or taken away brings about the change into the opposite — the many. For to repeat one is just to obtain many, the repetition causes certain 'many' grains to come together. The one thus becomes its opposite, — a heap, and the taking of one away brings about baldness. One and a heap are opposed to one another, but yet one; or the quantitative progression seems not to change but merely to increase or diminish, yet at last it has passed into its opposite. We always separate quality and quantity from one another, and only accept in the many a quantitative difference; but this indifferent distinction of number or size here turns finally into qualitative distinction, just as an infinitely small or infinitely great greatness is no longer greatness at all. This characteristic of veering round is of the greatest importance, although it does not come directly before our consciousness. To give one penny or one shilling is said to be nothing, but with all its insignificance the purse becomes emptied, which is a very qualitative difference. Or, if water is always more and more heated, it suddenly, at 80° Reamur, turns into steam. The dialectic of this

passing into one another of quantity and quality is what our understanding does not recognize; it is certain that qualitative is not quantitative, and quantitative not qualitative. In those examples which seem like jokes, there is in this way genuine reflection on the thought-determinations which are in question.

The examples which Aristotle brings forward in his Elenchi, all show a very formal contradiction, appearing in speech, since even in it the individual is taken into the universal. "Who is that? It is Coriscus. Is Coriscus not masculine? Yes. *That* is neuter sex, and thus Coriscus is said to be neuter."[157] Or else Aristotle (De Sophist. Elench. c. 24) quotes the argument: "To thee a dog is father (*σὸς ὁ κύων πατήρ*). Thou art thus a dog;" that is what Plato, as we already mentioned (p. 370), made a Sophist say: it is the wit of a journeyman such as we find in Eulenspiegel. Aristotle is really at great pains to remove the confusion, for he says the 'thy' and the 'father' are only accidentally (*παρὰ τὸ συμβεβηκός*), and not in substance (*κατὰ τὴν οὐσίαν*) joined to one another. In the invention of such witticisms, the Greeks of that and of later times were quite indefatigable. With the Sceptics we shall later on see the dialectic side further developed and brought to a higher standpoint.

c. Stilpo.

Stilpo, a native of Megara, is one of the most celebrated of the Eristics. Diogenes tells us that "he was a very powerful debater, and excelled all so greatly in readiness of speech that all Greece, in looking to him, was in danger (μικροῦ δεῆσαι) of becoming Megareans." He lived in the time of Alexander the Great, and after his death (Ol. 114, 1; 324 B.C.) in Megara, when Alexander's generals fought together. Ptolemy Soter, Demetrius Poliorcetes, Antigonus' son, when they conquered Megara, bestowed many honours on him. "In Athens all came out of their work-places to see him,

and when anyone said that they admired him like a strange animal, he replied, No, but like a true man."[158] With Stilpo it was pre-eminently true that the universal was taken in the sense of the formal abstract identity of the understanding. The main point in his examples is, however, always the fact of his having given prominence to the form of universality as opposed to the particular.

α. Diogenes (II. 119) first quotes from him in relation to the opposition of the 'this' and the universal, "Whoever speaks of any man (*ἄνθρωπον εἶναι*), speaks of no one, for he neither speaks of this one nor that. For why should it rather be of this one than that? Hence it is not of this one." That man is the universal, and that no one is specially indicated, everyone readily acknowledges, but some one still remains present to us in our conception. But Stilpo says that the 'this' does not exist at all, and cannot be expressed — that the universal only exists. Diogenes Laërtius certainly understands this as though "Stilpo abolished distinction of genera (*ἀνῄρει καὶ τὰ εἴδη*)," and Tennemann (Vol II., p. 158) supports him. But from what is quoted from him the opposite may clearly be deduced — that he upheld the universal and did away with the individual. And the fact that the form of universality is maintained, is further expressed in a number of anecdotes which are taken by Stilpo from common life. Thus he says: "The cabbage is not what is here shown (*τὸ λάχανον οὐκ ἔστι τὸ δεικνύμενον*). For the cabbage has existed for many thousand years, and hence this (what is seen) is not cabbage," *i.e.* the universal only is, and this cabbage is not. If I say *this* cabbage, I say quite another thing from what I mean, for I say all other cabbages. An anecdote is told in the same reference. "He was conversing with Crates, a Cynic, and broke off to buy some fish;" Crates said, "What, you would avoid the question?" (for even in ordinary life anyone is laughed at or thought stupid who is unable to reply, and here where the subject was so important and where it would seem better to reply anything than nothing

at all, no answer was forthcoming). Stilpo replied, “By no means, for I have the conversation, but I leave you, since the conversation remains but the fish will be sold.” What is indicated in these simple examples seems trivial, because the matter is trivial, but in other forms it seems important enough to be the subject of further inquiry.

That the universal should in Philosophy be given a place of such importance that only the universal can be expressed, and the ‘this’ which is meant, cannot, indicates a state of consciousness and thought which the philosophic culture of our time has not yet reached. As regards the ordinary human understanding, or the scepticism of our times, or in general the Philosophy which asserts that sensuous certainty (that which we see, hear, &c.), is the truth, or else that it is true that there are sensuous things outside of us — as to these, nothing, so far as the reasons for disbelieving them are concerned, need be said. For because the direct assertion that the immediate is the true is made, such statements only require to be taken with respect to what they say, and they will always be found to say something different from what they mean. What strikes us most is that they cannot say what they mean; for if they say the sensuous, this is a universal; it is all that is sensuous, a negative of the ‘this,’ or ‘this’ is all ‘these.’ Thought contains only the universal, the ‘this’ is only in thought; if I say ‘this’ it is the most universal of all. For example, here is that which I show; now I speak; but here and now is all here and now. Similarly when I say ‘I,’ I mean myself, this individual separated from all others. But I am even thus that which is thought of and cannot express the self which I mean at all. ‘I’ is an absolute expression which excludes every other ‘I,’ but everyone says ‘I’ of himself, for everyone is an ‘I.’ If we ask who is there, the answer ‘I’ indicates every ‘I.’ The individual also is thus the universal only, for in the word as an existence born of the mind, the individual, if it is meant, cannot find a place, since actually only the universal is expressed. If I would distinguish myself

and establish my individuality by my age, my place of birth, through what I have done and where I have been or am at a particular time, it is the same thing. I am now so many years old, but this very now which I say is all now. If I count from a particular period such as the birth of Christ, this epoch is again only fixed by the 'now' which is ever displaced. I am now thirty-five years old, and now is 1805 A.D.; each period is fixed only through the other, but the whole is undetermined. That 'now' 1805 years have passed since Christ's birth, is a truth which soon will become empty sound, and the determinateness of the 'now' has a before and after of determinations without beginning or end. Similarly everyone is at a 'here' — this here, for everyone is in a 'here.' This is the nature of universality, which makes itself evident in speech. We hence help ourselves through names with which we define perfectly anything individual, but we allow that we have not expressed the thing in itself. The name as name, is no expression which contains what I am; it is a symbol, and indeed a contingent symbol, of the lively recollection.

β. Inasmuch as Stilpo expressed the universal as the independent, he disintegrated everything. Simplicius says (in Phys. Arist. p. 26), "Since the so-called Megarics took it as ascertained that what has different determinations is different (*ὧν οἱλόγοι ἕτεροι, ταῦτα ἕτερα ἐστιν*), and that the diverse are separated one from the other (*τὰ ἕτερα κεχώρισται ἀλλήλων*), they seemed to prove that each thing is separated from itself (*αὐτὸ αὐτοῦ κεχωρισμένον ἕκασον*). Hence since the musical Socrates is another determination (*λόγος*) from the wise Socrates, Socrates was separated from himself." That means that because the qualities of things are determinations for themselves, each of these is fixed independently, but yet the thing is an aggregate of many independent universalities. Stilpo asserted this. Now because, according to him, universal determinations are in their separation

only the true reality, and the individual is the unseparated unity of different ideas, to him nothing individual has any truth.

γ. It is very remarkable that this form of identity came to be known in Stilpo, and he in this way only wished to know propositions identically expressed. Plutarch quotes from him: “A different predicate may in no case be attributed to any object (*ἕτερον ἑτέρου μὴ κατηγορεῖσθαι*). Thus we could not say that the man is good or the man is a general, but simply that man is only man, good is only good, the general is only the general. Nor could we say ten thousand knights, but knights are only knights, ten thousand are only ten thousand, &c. When we speak of a horse running, he says that the predicate is not identical with the object to which it is attributed. For the concept-determination man is different (*τοῦ τί ἦν εἶναι τὸν λόγον*) from the concept-determination good. Similarly horse and running are distinct: when we are asked for a definition of either, we do not give the same for both. Hence those who say something different of what is different are wrong. For if man and good were the same, and likewise horse and running, how could good be used of bread and physic, and running of lions and dogs”?[159] Plutarch remarks here that Colotes attacks Stilpo in a bombastic manner (*τραγῳδίαν ἐπάγει*) as though he ignored common life (*τὸν βίον ἀναιρεῖσθαι*). “But what man,” Plutarch reflects, “lived any the worse for this? Is there any man who hears this said, and who does not know that it is an elaborate joke (*παῖζοντός ἐστιν εὐμούσως*)?”

2. The Cyrenaic School.

The Cyrenaics took their name from Aristippus of Cyrene in Africa, the originator and head of the school. Just as Socrates wished to develop himself as an individual, his disciples, or those of the Cyrenaic and Cynic Schools, made individual life and practical philosophy their main object. Now if the Cyrenaics did not rest content with the determination of good in

general, seeing that they inclined to place it in the enjoyment of the individual, the Cynics appear to be opposed to the whole doctrine, for they expressed the particular content of satisfaction as natural desires in a determination of negativity with regard to what is done by others. But as the Cyrenaics thereby satisfied their particular subjectivity, so also did the Cynics, and both schools have hence on the whole the same end — the freedom and independence of the individual. Because we are accustomed to consider happiness, which the Cyrenaics made the highest end of man, to be contentless, because we obtain it in a thousand ways, and it may be the result of most various causes, this principle appears at first to us as trivial, and indeed, generally speaking, it is so; we are likewise accustomed to believe that there is something higher than pleasure. The philosophic development of this principle which, for the rest, has not much in it, is mainly ascribed to Aristippus' follower, Aristippus the younger. But Theodorus, Hegesias, and Anniceris, of the later Cyrenaics, are specially mentioned as having scientifically worked out the Aristippian principle, until it degenerated and merged into Epicureanism. But the consideration of the further progress of the Cyrenaic principle is specially interesting because this progression, in the essential nature of things, is carried quite beyond the principle, and has really abrogated it. Feeling is the indeterminate individual. But if thought, reflection, mental culture, are given a place in this principle, through the principle of the universality of thought that principle of contingency, individuality, mere subjectivity, disappears; and the only really remarkable thing in this school is that this greater consistency in the universal is therefore an inconsistency as regards the principle.

a. Aristippus.

Aristippus went about with Socrates for a long time, and educated himself under him, although at the same time he was a strong and highly cultivated man before he sought out Socrates at all. He heard of him either in Cyrene or at the Olympian Games, which, as Greeks, the Cyrenians likewise visited. His father was a merchant, and he himself came to Athens on a journey which had commerce as its object. He was first amongst the Socratics to ask money of those whom he instructed; he also sent money to Socrates, who, however, returned it.[160] He did not content himself with the general expressions, good and beautiful, to which Socrates adhered, but took existence reflected in consciousness in its extreme determinateness as individuality; and because universal existence, as thought, was to him, from the side of reality, individual consciousness, he fixed on enjoyment as the only thing respecting which man had rationally to concern himself. The character and personality of Aristippus is what is most important, and what is preserved to us in his regard is his manner and life rather than his philosophic doctrines. He sought after enjoyment as a man of culture, who in that very way had raised himself into perfect indifference to all that is particular, all passions and bonds of every kind. When pleasure is made the principle, we immediately have the idea before us that in its enjoyment we are dependent, and that enjoyment is thus opposed to the principle of freedom. But neither of the Cyrenaic teaching, nor the Epicurean, whose principle is on the whole the same, can this be stated. For by itself the end of enjoyment may well be said to be a principle in opposition to Philosophy; but when it is considered in such a way that the cultivation of thought is made the only condition under which enjoyment can be attained, perfect freedom of spirit is retained, since it is inseparable from culture. Aristippus certainly esteemed culture at its highest, and proceeded from this position — that pleasure is only a principle for men of philosophic culture;

his main principle thus was that what is found to be pleasant is not known immediately but only by reflection.

Aristippus lived in accordance with these principles, and what in him interests us most is the number of anecdotes told about him, because they contain traces of a mentally rich and free disposition. Since in his life he went about to seek enjoyment, not without understanding (and thereby he was in his way a philosopher), he sought it partly with the discretion which does not yield itself to a momentary happiness, because a greater evil springs therefrom; and partly (as if philosophy were merely preservation from anxiety) without that anxiety which on every side fears possible evil and bad results; but above all without any dependence on things, and without resting on anything which is itself of a changeable nature. He enjoyed, says Diogenes, the pleasures of the moment, without troubling himself with those which were not present; he suited himself to every condition, being at home in all; he remained the same whether he were in regal courts or in the most miserable conditions. Plato is said to have told him that it was given to him alone to wear the purple and the rags. He was specially attached to Dionysius, being very popular with him; he certainly clung to him, but always retained complete independence. Diogenes, the Cynic, for this reason called him the royal dog. When he demanded fifty drachms from someone who wished to hand over to him his son, and the man found the sum too high, saying that he could buy a slave for it, Aristippus answered, "Do so, and you will have two." When Socrates asked him, "How do you have so much money?" he replied, "How do you have so little?" When a courtesan said to him that she had a child by him, he replied, "You know as little whether it is mine as, were you walking through briars, would you know which thorn pricked you." A proof of his perfect indifference is given in the following: When Dionysius once spat at him, he bore it patiently, and when blamed, said, "The fishermen let themselves be

wet by the sea to catch the little fish, and I, should I not bear this to catch such a good one?" When Dionysius asked him to choose one of three courtesans, he took them all with him, observing that it had been a dangerous thing even to Paris to choose out one; but after leading them to the vestibule of the house, he let all three go. He made nothing of the possession of money as contrasted with the results which appear to follow from pursuing pleasure, and hence he wasted it on dainties. He once bought a partridge at fifty drachms (about twenty florins). When someone rebuked him, he asked, "Would you not buy it for a farthing?" And when this was acknowleged, he answered, "Now fifty drachms are no more than that to me." Similarly in journeying in Africa, the slave thought it hard to be troubled with a sum of money. When Aristippus knew this he said, "Throw away what is too much and carry what you can."

As regards the value of culture, he replied to the question as to how an educated man differs from an uneducated, that a stone would not fit in with the other, *i.e.* the difference is as great as that of a man from the stone. This is not quite wrong, for man is what he ought to be as man, through culture; it is his second nature through which he first enters into possession of that which he has by nature, and thus for the first time he is Mind. We may not, however, think in this way of our uncultured men, for with us such men through the whole of their conditions, through customs and religion, partake of a source of culture which places them far above those who do not live in such conditions. Those who carry on other sciences and neglect Philosophy, Aristippus compares to the wooers of Penelope in the Odyssey, who might easily have Melantho and the other maidens, but who could not obtain the queen.[161]

The teaching of Aristippus and his followers is very simple, for he took the relation of consciousness to existence in its most superficial and its earliest form, and expressed existence as Being as it is immediately for

consciousness, *i.e.* as feeling simply. A distinction is now made between the true, the valid, what exists in and for itself, and the practical and good, and what ought to be our end; but in regard to both the theoretic and practical truth, the Cyrenaics make sensation what determines. Hence their principle is more accurately not the objective itself, but the relation of consciousness to the objective; the truth is not what is in sensation the content, but is itself sensation, it is not objective, but the objective subsists only in it. "Thus the Cyrenaics say, sensations form the real criterion; they alone can be known, and are infallible, but what produces feeling is neither knowable nor infallible. Thus when we perceive a white and sweet, we may assert this condition as ours with truth and certainty. But that the causes of these feelings are themselves a white and sweet object we cannot with certainty affirm. What these men say about ends is also in harmony with this, for sensations also extend to ends. The sensations are either pleasant or unpleasant or neither of the two. Now they call the unpleasant feelings the bad, the end of which is pain; the pleasant is the good, whose invariable end is happiness. Thus feelings are the criteria of knowledge and the ends for action. We live because we follow them from testimony (*ἐναργείᾳ*) received and satisfaction (*εὐδοκήσει*) experienced, the former in accordance with theoretic intuitions (*κατὰ τὰ ἄλλα πάθη*), and the latter with what gives us pleasure."[162] That is to say, as end, feeling is no longer a promiscuous variety of sensuous affections (*τὰ ἄλλα πάθη*), but the setting up of the Notion as the positive or negative relation to the object of action, which is just the pleasant or the unpleasant.

Here we enter on a new sphere where two kinds of determinations constitute the chief points of interest; these are everywhere treated of in the many Socratic schools which were being formed, and though not by Plato and Aristotle, they were specially so by the Stoics, the new Academy, &c. That is to say, the one point is determination itself in general, the criterion;

and the second is what determination for the subject is. And thus the idea of the wise man results — what the wise do, who the wise are, &c. The reason that these two expressions are now so prominent is one which rests on what has gone before. On the one hand the main interest is to find a content for the good, for else men may talk about it for years. This further definition of the good is just the criterion. On the other hand the interest of the subject appears, and that is the result of the revolution in the Greek mind made by Socrates. When the religion, constitution, laws of a people, are held in esteem, and when the individual members of a people are one with them, the question of what the individual has to do on his own account, will not be put. In a moralized, religious condition of things we are likely to find the end of man in what is present, and these morals, religion and laws are also present in him. When, on the contrary, the individual exists no longer in the morality of his people, no longer has his substantial being in the religion, laws, &c., of his land, he no longer finds what he desires, and no longer satisfies himself in his present. But if this discord has arisen, the individual must immerse himself in himself, and there seek his end. Now this is really the cause that the question of what is the essential for the individual arises. After what end must he form himself and after what strive? Thus an ideal for the individual is set up, and this is the wise man: what was called the ideal of the wise man is the individuality of self-consciousness which is conceived of as universal essence. The point of view is the same when we now ask, What can I know? What should I believe? What ought I to hope? What is the highest interest of the subject? It is not what is truth, right, the universal end of the world, for instead of asking about the science of the implicitly and explicitly objective, the question is what is true and right in as far as it is the insight and conviction of the individual, his end and a mode of his existence? This talk about wise men is universal amongst the Stoics, Epicureans, &c., but is devoid of meaning. For the wise man is not

in question, but the wisdom of the universe, real reason. A third definition is that the universal is the good; the real side of things is enjoyment and happiness as a simple existence and immediate actuality. How then do the two agree? The philosophic schools which now arise and their successors have set forth the harmony of both determinations, which are the higher Being and thought.

b. Theodorus.

Of the later Cyrenaics, Theodorus must be mentioned first; he is famous for having denied the existence of the gods, and being, for this reason, banished from Athens. Such a fact can, however, have no further interest or speculative significance, for the positive gods which Theodorus denied, are themselves not any object of speculative reason. He made himself remarkable besides for introducing the universal more into the idea of that which was existence for consciousness, for "he made joy and sorrow the end, but in such a way that the former pertained to the understanding and the latter to want of understanding. He defined the good as understanding and justice, and the bad as the opposite; enjoyment and pain, however, were indifferent."[163] When we reach the consciousness that the individual sensuous feeling, as it is immediately, is not to be considered as real existence, it is then said that it must be accepted with understanding; *i.e.* feeling, just as it is, is not reality. For the sensuous generally, as sensation, theoretic or practical, is something quite indeterminate, this or that unit; a criticism of this unit is hence required, *i.e.* it must be considered in the form of universality, and hence this last necessarily reappears. But this advance on individuality is culture, which, through the limitation of individual feelings and enjoyments, tries to make these harmonious, even though it first of all only calculates as to that by which the greater pleasure is to be found. Now, to the question as to which of the many enjoyments which I, as

a many-sided man, can enjoy, is the one which is in completest harmony with me, and in which I thus find the greatest satisfaction, it must be replied that the completest harmony with me is only found in the accordance of my particular existence and consciousness with my actual substantial Being. Theodorus comprehended this as understanding and justice, in which we know where to seek enjoyment. But when it is said that felicity must be sought by reflection, we know that these are empty words and thoughtless utterances. For the feeling in which felicity is contained, is in its conception the individual, self-changing, without universality and subsistence. Thus the universal, understanding, as an empty form, adheres to a content quite incongruous with it; and thus Theodorus distinguished the Good in its form, from the end as the Good in its nature and content.

c. Hegesias.

It is remarkable that another Cyrenaic, Hegesias, recognized this incongruity between sensation and universality, which last is opposed to the individual, having what is agreeable as well as disagreeable within itself. Because, on the whole, he took a firmer grasp of the universal and gave it a larger place, there passed from him all determination of individuality, and with it really the Cyrenaic principle. It came to his knowledge that individual sensation is in itself nothing; and, as he nevertheless made enjoyment his end, it became to him the universal. But if enjoyment is the end, we must ask about the content; if this content is investigated, we find every content a particular which is not in conformity with the universal, and thus falls into dialectic. Hegesias followed the Cyrenaic principle as far as to this consequence of thought. That universal is contained in an expression of his which we often enough hear echoed, "There is no perfect happiness. The body is troubled with manifold pains, and the soul suffers along with it; it is hence a matter of indifference whether we choose life or death. In itself

nothing is pleasant or unpleasant." That is to say, the criterion of being pleasant or unpleasant, because its universality is removed, is thus itself made quite indeterminate; and because it has no objective determinateness in itself, it has become unmeaning; before the universal, which is thus held secure, the sum of all determinations, the individuality of consciousness as such, disappears, but with it even life itself as being unreal. "The rarity, novelty, or excess of enjoyment begets in some cases enjoyment and in others discontent. Poverty and riches have no meaning for what is pleasant, since we see that the rich do not enjoy pleasures more than the poor. Similarly, slavery and liberty, noble and ignoble birth, fame and lack of fame, are equivalent as regards pleasure. Only to a fool can living be a matter of moment; to the wise man it is indifferent," and he is consequently independent. "The wise man acts only after his own will, and he considers none other equally worthy. For even if he attain from others the greatest benefits, this does not equal what he gives himself. Hegesias and his friends also take away sensation, because it gives no sufficient knowledge," which really amounts to scepticism. "They say further that we ought to do what we have reason to believe is best. The sinner should be forgiven, for no one willingly sins, but is conquered by a passion. The wise man does not hate, but instructs; his endeavours go not so much to the attainment of good, as to the avoidance of evil, for his aim is to live without trouble and sorrow."[164] This universality, which proceeds from the principle of the freedom of the individual self-consciousness, Hegesias expressed as the condition of the perfect indifference of the wise men — an indifference to everything into which we shall see all philosophic systems of the kind going forth, and which is a surrendering of all reality, the complete withdrawal of life into itself. It is told that Hegesias, who lived in Alexandria, was not allowed to teach the Ptolemies of the time, because he inspired many of his hearers with such indifference to life that they took their own.[165]

d. Anniceris.

We also hear of Anniceris and his followers, who, properly speaking, departed from the distinctive character of the principle of the Cyrenaic school, and thereby gave philosophic culture quite another direction. It is said of them that "they acknowledged friendship in common life, along with gratitude, honour to parents, and service for one's country. And although the wise man has, by so doing, to undergo hardship and work, he can still be happy, even if he therein obtains few pleasures. Friendships are not to be formed on utilitarian grounds alone, but because of the good will that develops; and out of love to friends, even burdens and difficulties are to be undertaken."[166] The universal, the theoretically speculative element in the school, is thus lost; it sinks more into what is popular. This is then the second direction which the Cyrenaic school has taken; the first was the overstepping of the principle itself. A method of philosophizing in morals arises, which later on prevailed with Cicero and the Peripatetics of his time, but the interest has disappeared, so far as any consistent system of thought is concerned.

3. The Cynic School.

There is nothing particular to say of the Cynics, for they possess but little Philosophy, and they did not bring what they had into a scientific system; it was only later that their tenets were raised by the Stoics into a philosophic discipline. With the Cynics, as with the Cyrenaics, the point was to determine what should be the principle for consciousness, both as regards its knowledge and its actions. The Cynics also set up the Good as a universal end, and asked in what, for individual men, it is to be sought. But if the Cyrenaic, in accordance with his determinate principle, made the consciousness of himself as an individual, or feeling, into real existence for

consciousness, the Cynic took this individuality, in as far as it has the form of universality directly for me, *i.e.* in as far as I am a free consciousness, indifferent to all individuality. Thus they are opposed to the Cyrenaics for while to these feeling, which, because it has to be determined through thought, is undoubtedly extended into universality and perfect freedom, is made the principle, the former begin with perfect freedom and independence as the property of man. But since this is the same indifference of self-consciousness which Hegesias expressed as real existence, the extremes in the Cynic and Cyrenaic modes of thought destroy themselves by their own consequences, and pass into one another. With the Cyrenaics there is the impulse to turn things back into consciousness, according to which nothing is real existence for me; the Cynics had also only to do with themselves, and the individual self-consciousness was likewise principle. But the Cynic, at least in the beginning, set up for the guidance of men the principle of freedom and indifference, both in regard to thought and actual life, as against all external individuality, particular ends, needs, and enjoyments; so that culture not only sought after indifference to these and independence within itself, as with the Cyrenaics, but for express privation, and for the limitation of needs to what is necessary and what nature demands. The Cynics thus maintained as the content of the good, the greatest independence of nature, *i.e.* the slightest possible necessities; this meant a rebound from enjoyment, and from the pleasures of feeling. The negative is here the determining; later on this opposition of Cynics and Cyrenaics likewise appeared between Stoics and Epicureans. But the same negation which the Cynics made their principle, had already shown itself in the further development which the Cyrenaic philosophy had taken. The School of the Cynics had no scientific weight; it only constitutes an element which must necessarily appear in the knowledge of the universal, and which is that consciousness must know itself in its individuality, as free from all

dependence on things and on enjoyment. To him who relies upon riches or enjoyment such dependence is in fact real consciousness, or his individuality is real existence. But the Cynics so enforced that negative moment that they placed freedom in actual renunciation of so-called superfluities; they only recognized this abstract unmoving independence, which did not concern itself with enjoyment or the interests of an ordinary life. But true freedom does not consist in flying from enjoyment and the occupations which have as their concern other men and other ends in life; but in the fact that consciousness, though involved in all reality, stands above it and is free from it.

a. Antisthenes.

Antisthenes, an Athenian and friend of Socrates, was the first who professed to be a Cynic. He lived at Athens, and taught in a gymnasium, called Cynosarges, and he was called the "simple dog" (*ἁπλοκύων*). His mother was Thracian, which was often made a reproach to him — a reproach which to us would be unmeaning. He replied that the mother of the gods was a Phrygian, and that the Athenians, who make so much of their being native born, are in no way nobler than the native fish and grasshoppers. He educated himself under Gorgias and Socrates, and went daily from the Piræus to the city to hear Socrates. He wrote several works, the titles of which Diogenes mentions, and, according to all accounts, was esteemed a highly cultivated and upright man.[167]

Antisthenes' principles are simple, because the content of his teaching remains general; it is hence superfluous to say anything further about it. He gives general rules, which consist of such excellent maxims as that "virtue is self-sufficing, and requires nothing more than a Socratic strength of character. The good is excellent, the bad discreditable. Virtue consists of works, and does not require many reasons or theories. The end of man is a

virtuous life. The wise man is contented with himself, for he possesses everything that others seem to possess. His own virtue satisfies him; he is at home all over the world. If he lacks fame, this is not to be regarded as an evil, but as a good," &c.[168] We here, once more, have the tedious talk about the wise man, which by the Stoics, as also by the Epicureans, was even more spun out and made more tedious. In this ideal, where the determination of the subject is in question, its satisfaction is placed in simplifying its needs. But when Antisthenes says that virtue does not require reasons and theories, he forgets that he himself acquired, through the cultivation of mind, its independence and the power of renouncing all that men desire. We see directly that virtue has now obtained another signification; it no longer is unconscious virtue, like the simple virtue of a citizen of a free people, who fulfils his duties to fatherland, place, and family, as these relationships immediately require. The consciousness which has gone beyond itself must, in order to become Mind, now lay hold of and comprehend all reality, i.e. be conscious of it as its own. But conditions such as are called by names like innocence or beauty of soul, are childish conditions, which are certainly to be praised in their own place, but from which man, because he is rational, must come forth, in order to re-create himself from the sublated immediacy. The freedom and independence of the Cynics, however, which consists only in lessening to the utmost the burden imposed by wants, is abstract, because it, as negative in character, has really to be a mere renunciation. Concrete freedom consists in maintaining an indifferent attitude towards necessities, not avoiding them, but in their satisfaction remaining free, and abiding in morality and in participation in the moral life of man. Abstract freedom, on the contrary, surrenders its morality, because the individual withdraws into his subjectivity, and is consequently an element of immorality.

Yet Antisthenes bears a high place in this Cynical philosophy. But the attitude he adopted comes very near to that of rudeness, vulgarity of conduct and shamelessness; and later on Cynicism passed into such. Hence comes the continual mockery of, and the constant jokes against the Cynics; and it is only their individual manners and individual strength of character which makes them interesting. It is even told of Antisthenes that he began to attribute value to external poverty of life. Cynicism adopted a simple wardrobe — a thick stick of wild olive, a ragged double mantle without any under garment, which served as bed by night, a beggar's sack for the food that was required, and a cup with which to draw water.[169] This was the costume with which these Cynics used to distinguish themselves. That on which they placed highest value was the simplification of their needs; it seems very plausible to say that this produces freedom. For needs are certainly dependence upon nature, and this is antagonistic to freedom of spirit; the reduction of that dependence to a minimum is thus an idea which commends itself. But at the same time this minimum is itself undetermined, and if such stress is laid on thus merely following nature, it follows that too great a value is set on the needs of nature and on the renunciation of others. This is what is also evident in the monastic principle. The negative likewise contains an affirmative bias towards what is renounced; and the renunciation and the importance of what is renounced is thus made too marked. Socrates hence declares the clothing of the Cynics to be vanity. For "when Antisthenes turned outside a hole in his cloak, Socrates said to him, I see thy vanity through the hole in thy cloak."[170] Clothing is not a thing of rational import, but is regulated through needs that arise of themselves. In the North the clothing must be different from that in Central Africa; and in winter we do not wear cotton garments. Anything further is meaningless, and is left to chance and to opinion; in modern times, for instance, old-fashioned clothing had a meaning in relation to patriotism. The cut of my

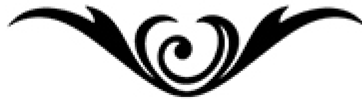
coat is decided by fashion, and the tailor sees to this; it is not my business to invent it, for mercifully others have done so for me. This dependence on custom and opinion is certainly better than were it to be on nature. But it is not essential that men should direct their understanding to this; indifference is the point of view which must reign, since the thing itself is undoubtedly perfectly indifferent. Men are proud that they can distinguish themselves in this, and try to make a fuss about it, but it is folly to set oneself against the fashion. In this matter I must hence not decide myself, nor may I draw it within the radius of my interests, but simply do what is expected of me.

b. Diogenes.

Diogenes of Sinope, the best known Cynic, distinguished himself even more than Antisthenes by the life he led, as also by his biting and often clever hits, and bitter and sarcastic retorts; but he likewise received replies which were often aimed as well. He is called the Dog, just as Aristippus was called by him the royal Dog, for Diogenes bore the same relation to idle boys as Aristippus did to kings. Diogenes is only famed for his manner of life; with him, as with the moderns, Cynicism came to signify more a mode of living than a philosophy. He confined himself to the barest necessities, and tried to make fun of others who did not think as he, and who laughed at his ways. That he threw away his cup when he saw a boy drinking out of his hands is well known. To have no wants, said Diogenes, is divine; to have as few as possible is to come nearest to the divine. He lived in all sorts of places, in the streets of Athens, in the market in tubs; and he usually resided and slept in Jupiter's Stoa in Athens; he hence remarked that the Athenians had built him a splendid place of residence.[171] Thus the Cynics thought not only of dress, but also of other wants. But a mode of life such as that followed by the Cynics, which professed to be a result of culture, is really conditioned by the culture of the mind. The

Cynics were not anchorites; their consciousness was still essentially related to other consciousness. Antisthenes and Diogenes lived in Athens, and could only exist there. But in culture the mind is also directed to the most manifold needs, and to the methods of satisfying these. In more recent times the needs have much increased, and hence a division of the general wants into many particular wants and modes of satisfaction has arisen; this is the function of the activity of the understanding, and in its application luxury has a place. We may declaim against the morality of this, but in a State all talents, natural inclinations and customs must have free scope and be brought into exercise, and every individual may take what part he will, only he must in the main make for the universal. Thus the chief point is to place no greater value on such matters than what is demanded, or generally, to place no importance either on possessing or dispensing with them.

Of Diogenes we have only anecdotes to relate. In a voyage to Ægina he fell into the hands of sea-robbers, and was to be sold as a slave in Crete. Being asked what he understood, he replied, "To command men," and told the herald to call out, "Who will buy a ruler?" A certain Xeniades of Corinth bought him, and he instructed his sons.



There are very many stories told of his residence in Athens. There he presented a contrast in his rudeness and disdainfulness to Aristippus' fawning philosophy. Aristippus set no value on his enjoyments any more than on his wants, but Diogenes did so on his poverty. Diogenes was once washing his greens when Aristippus passed by, and he called out, "If you knew how to wash your greens yourself, you would not run after kings." Aristippus replied very aptly, "If you knew how to associate with men, you would not wash greens." In Plato's house he once walked on the beautiful carpets with muddy feet, saying, "I tread on the pride of Plato." "Yes, but with another pride," replied Plato, as pointedly. When Diogenes stood wet through with rain, and the bystanders pitied him, Plato said, "If you wish to

compassionate him, just go away. His vanity is in showing himself off and exciting surprise; it is what made him act in this way, and the reason would not exist if he were left alone.” Once when he got a thrashing, as anecdotes often tell, he laid a large plaster on his wounds, and wrote on it the names of those who had struck him in order that they might be blamed of all. When youths standing by him said, “We are afraid that you will bite us,” he replied, “Don’t mind, a dog never eats turnips.” At a feast a guest threw bones to him like a dog, and he went up to him and behaved to him like a dog. He gave a good answer to a tyrant who asked him from what metal statues should be cast: “From the metal from which the statues of Harmodius and Aristogiton were cast.” He tried to eat raw meat, which did not, however, agree with him; he could not digest it, and died at a very great age, as he lived — in the streets.[172]

c. Later Cynics.

Antisthenes and Diogenes, as already mentioned, were men of great culture. The succeeding Cynics are not any the less conspicuous by their exceeding shamelessness, but they were, generally speaking, nothing more than swinish beggars, who found their satisfaction in the insolence which they showed to others. They are worthy of no further consideration in Philosophy, and they deserve in its full the name of dogs, which was early given to them; for the dog is a shameless animal. Crates, of Thebes, and Hipparchia, a Cynic, celebrated their nuptials in the public market.[173] This independence of which the Cynics boasted, is really subjection, for while every other sphere of active life contains the affirmative element of free intelligence, this means the denying oneself the sphere in which the element of freedom can be enjoyed.

[55] De Sensu, p. 1, ed. Steph. 1557 (citante Fülleborn, p. 92).

[56] This obscure clause has been differently interpreted. Dr. Hutchison Stirling, in his annotations on Schwegler's "History of Philosophy," says: "Zeller accepts (and Hegel, by quoting and translating the whole passage, already countenanced him in advance) the equivalent of Theophrastus for *τὸ πλέον, τὸ ὑπέρβαλλον* namely, and interprets the clause itself thus:— 'The preponderating element of the two is thought occasions and determines the ideas;' that is as is the preponderating element (the warm or the cold) so is the state of mind. In short, *the more is the thought* is the linguistic equivalent of the time for *according to the more is the thought*." (Translator's note.)

[57] As a matter of fact, since a comparison of this reasoning with the fragments of Melissus which Simplicius (in Arist. Physica and De Cœlo) has retained, places this conjecture beyond doubt, the editor is constrained to place it here, although Hegel, when he dealt with the Eleatics separately, put it under the heading of Xenophanes. (Note by Editor.)

[78] Hegel certainly used in his lectures, to follow the usual order, and treat Empedocles before the Atomists. But since, in the course of his treatment of them, he always connected the Atomists with the Eleatics and Heraclitus, and took Empedocles, in so far as he anticipated design, as the forerunner of Anaxagoras, the present transposition is sufficiently justified. If we further consider that Empedocles swayed to and fro between the One of Heraclitus and the Many of Leucippus, without, like them, adhering to either of these one-sided determinations, it is clear that both moments are assumptions through whose variations he opened a way for the Anaxagorean conception of end, which, by comprehending them, is the essential unity from which proceeds the manifold of phenomena, as from their immanent source. — (Note by Editor.)

[116] Sext. Empir. adv. Math. VII. 83, 84.

[117] The distinction between these two words is a very important one. Schwegler, in explaining Hegel's position in his "History of Philosophy," states that Hegel asserts that Socrates set *Moralität*, the subjective morality of individual conscience, in the place of *Sittlichkeit*, "the spontaneous, natural, half-unconscious (almost instinctive) virtue that rests in obedience to established custom (use and wont, natural objective law, that is at bottom, according to Hegel, rational, though not yet subjectively cleared, perhaps, into its rational principles)." As Dr. Stirling says in his Annotations to the same work (p. 394), "There is a period in the history of the State when people live in tradition; that is a period of unreflected *Sittlichkeit*, or natural observance. Then there comes a time when the observances are questioned, and when the right or truth they involve is reflected into the subject. This is a period of Aufklärung, and for *Sittlichkeit* there is substituted *Moralität*, subjective morality: the subject will approve nought but what he finds inwardly true to himself, to his conscience." — (Translator's Note.)

CHAPTER III. First Period, Third Division: Plato and Aristotle.

THE DEVELOPMENT OF philosophic science as science, and, further, the progress from the Socratic point of view to the scientific, begins with Plato and is completed by Aristotle. They of all others deserve to be called teachers of the human race.

A. Plato.

PLATO, WHO MUST be numbered among the Socratics, was the most renowned of the friends and disciples of Socrates, and he it was who grasped in all its truth Socrates' great principle that ultimate reality lies in consciousness, since, according to him, the absolute is in thought, and all reality is Thought. He does not understand by this a one-sided thought, nor what is understood by the false idealism which makes thought once more step aside and contemplate itself as conscious thought, and as in opposition to reality; it is the thought which embraces in an absolute unity reality as well as thinking, the Notion and its reality in the movement of science, as the Idea of a scientific whole. While Socrates had comprehended the thought which is existent in and for itself, only as an object for self-conscious will, Plato forsook this narrow point of view, and brought the merely abstract right of self-conscious thought, which Socrates had raised to a principle, into the sphere of science. By so doing he rendered it possible to interpret and apply the principle, though his manner of representation may not be altogether scientific.

Plato is one of those world-famed individuals, his philosophy one of those world-renowned creations, whose influence, as regards the culture and development of the mind, has from its commencement down to the present time been all-important. For what is peculiar in the philosophy of Plato is its application to the intellectual and supersensuous world, and its elevation of consciousness into the realm of spirit. Thus the spiritual element which belongs to thought obtains in this form an importance for consciousness, and is brought into consciousness; just as, on the other hand, consciousness obtains a foothold on the soil of the other. The Christian

religion has certainly adopted the lofty principle that man's inner and spiritual nature is his true nature, and takes it as its universal principle, though interpreting it in its own way as man's inclination for holiness; but Plato and his philosophy had the greatest share in obtaining for Christianity its rational organization, and in bringing it into the kingdom of the supernatural, for it was Plato who made the first advance in this direction.

We must begin by mentioning the facts of Plato's life. Plato was an Athenian, born in the third year of the 87th Olympiad, or, according to Dodwell, Ol. 87, 4 (B.C. 429), at the beginning of the Peloponnesian war, in the year in which Pericles died. He was, according to this, thirty-nine or forty years younger than Socrates. His father, Ariston, traced his lineage from Cadrus; his mother, Perictione, was descended from Solon. The paternal uncle of his mother was the celebrated Critias, who was for a time among the associates of Socrates, and who was the most talented and brilliant, but also the most dangerous and obnoxious, of the Thirty Tyrants of Athens (*supra*, Vol. I. p. 421). Critias is usually represented by the ancients as an atheist, with the Cyrenaic Theodoras and Diagoras of Melos; Sextus Empiricus (adv. Math. IX. 51-54) has preserved to us a fine fragment from one of his poems. Sprung from this noble race, and with no lack of means for his culture, Plato received from the most highly esteemed of the Sophists an education in all the arts which were then thought to befit an Athenian. In his family he was called Aristocles; it was only later that he received from his teacher the name of Plato. Some say that he was so styled because of the breadth of his forehead; others, because of the richness and breadth of his discourse; others again, because of his well-built form.[1]

In his youth he cultivated poetry, and wrote tragedies — very much like young poets in our day — also dithyrambs and songs. Various specimens of the last are still preserved to us in the Greek anthology, and have as subject his various loves; we have amongst others a well-known epigram on a

certain Aster, one of his best friends, which contains a pretty fancy, found also in Shakespeare's Romeo and Juliet:

"To the stars thou look'st, mine Aster,
O would that I were Heaven,
With eyes so many thus to gaze on thee."[2]

In his youth he had every intention of devoting himself to politics. He was brought by his father to Socrates when in his twentieth year, and enjoyed intimate friendship with him for eight years. It is related that Socrates dreamt on the preceding night that he had a young swan perched on his knees, whose wings quickly developed, and which then flew up to heaven, singing the sweetest songs. Many such incidents are mentioned by the ancients, and they bear witness to the deep reverence and love with which both contemporaries and those of later times regarded the calm dignity of Plato, and that loftiness of demeanour which he combined with extreme simplicity and lovableness, traits of character which won for him the name of "the divine." Plato did not content himself with the society and wisdom of Socrates, but studied in addition the older philosophers, particularly Heraclitus. Aristotle (Met. I. 6) states that Plato, before he ever came to Socrates, associated with Cratylus, and had been initiated into the doctrines of Heraclitus. He also studied the Eleatics, and very particularly the Pythagoreans, and he frequented the society of the most noted Sophists. Thus deeply immersed in Philosophy, he lost his interest in poetry and politics, and gave them up altogether, that he might devote himself entirely to scientific pursuits. He fulfilled, like Socrates, his term of military service as an Athenian citizen, and is said to have taken part in three campaigns.[3]

We have already mentioned (Vol. I. p. 448) that, after Socrates was put to death, Plato, like many other philosophers, fled from Athens, and betook himself to Euclides at Megara. Leaving Megara before long, he travelled first to Cyrene in Africa, where he turned his attention specially to

mathematics, under the guidance of the celebrated mathematician Theodoras, whom he introduces as taking part in several of his dialogues. Plato himself soon attained to high proficiency in mathematics. To him is attributed the solution of the Delian or Delphic problem, which was proposed by the oracle, and, like the Pythagorean dogma, has reference to the cube. The problem is, to draw a line the cube of which will be equal to the sum of two given cubes. This requires a construction through two curves. The nature of the tasks then set by the oracles is very curious; on this particular occasion application had been made to the oracle in a time of pestilence, and it responded by proposing an entirely scientific problem; the change indicated in the spirit of the oracle is highly significant. From Cyrene Plato went to Italy and Egypt. In Magna Græcia he made the acquaintance of the Pythagoreans of that day, Archytas of Tarentum, the celebrated mathematician, Philolaus and others; and he also bought the writings of the older Pythagoreans at a high price. In Sicily he made friends with Dion. Returning to Athens, he opened a school of Philosophy in the Academy, a grove or promenade in which stood a gymnasium, and there he discoursed to his disciples.[4] This pleasure-ground had been laid out in honour of the hero Academus, but Plato was the true hero of the Academy who did away with the old significance of the name, and overshadowed the fame of the original hero, whose place he so completely took that the latter comes down to after ages only as connected with Plato.

Plato's busy life in Athens was twice interrupted by a journey to Sicily, to the Court of Dionysius the younger, ruler of Syracuse and Sicily. This connection with Dionysius was the most important, if not the only external relation into which Plato entered; it had, however, no lasting result. Dion, the nearest relative of Dionysius, and other respected Syracusans, his friends, deluded themselves with vain hopes regarding Dionysius. He had been allowed by his father to grow up almost without education, but his

friends had instilled into him some notion of and respect for Philosophy, and had roused in him a desire to make acquaintance with Plato. They hoped that Dionysius would profit greatly by his intimacy with Plato, and that his character, which was still unformed, and to all appearance far from unpromising, would be so influenced by Plato's idea of the constitution of a true state, that this might, through him, come to be realized in Sicily. It was partly his friendship with Dion, and partly and more especially the high hopes he himself cherished of seeing a true form of government actually established by Dionysius, that induced Plato to take the mistaken step of journeying to Sicily. On the surface it seems an excellent idea that a young prince should have a wise man at his elbow to instruct and inspire him; and on this idea a hundred political romances have been based; the picture has, however, no reality behind it. Dionysius was much pleased with Plato, it is true, and conceived such a respect for him that he desired to be respected by him in turn; but this did not last long. Dionysius was one of those mediocre natures who may indeed in a half-hearted way aspire to glory and honour, but are capable of no depth and earnestness, however much they may affect it, and who lack all strength of character. His intentions were good, but the power failed him to carry them out; it was like our own satirical representations in the theatre, of a person who aspires to be quite a paragon, and turns out an utter fool. The position of affairs represented thereby can be nothing but this, seeing that lack of energy alone allows itself to be guided; but it is also the same lack of energy which renders impossible of execution even a plan made by itself. The rupture between Plato and Dionysius took place on personal grounds. Dionysius fell out with his relative Dion, and Plato became involved in the quarrel, because he would not give up his friendship with Dion. Dionysius was incapable of a friendship based on esteem and sympathy in pursuits; it was partly his personal inclination to Plato, and partly mere vanity, which had made him

seek the philosopher’s friendship. Dionysius could not, however, induce Plato to come under any obligation to him; he desired that Plato should give himself up to him entirely, but this was a demand that Plato refused to entertain.[5]

Plato accordingly took his departure. After the separation, however, both felt the desire to be again together. Dionysius recalled Plato, in order to effect a reconciliation with him; he could not endure that he should have failed in the attempt to attach Plato permanently to himself, and he found it specially intolerable that Plato would not give up Dion. Plato yielded to the urgent representations, not only of his family and Dion, but also of Archytas and other Pythagoreans of Tarentum, to whom Dionysius had applied, and who were taking an interest in the reconciliation of Dionysius with Dion and Plato; indeed, they went so far as to guarantee safety and liberty of departure to Plato. But Dionysius found that he could endure Plato’s presence no better than his absence; he felt himself thereby constrained. And though, by the influence of Plato and his other companions, a respect for science had been awakened in Dionysius, and he had thus become more cultured, he never penetrated beyond the surface. His interest in Philosophy was just as superficial as his repeated attempts in poetry; and while he wished to be everything — poet, philosopher, and statesman — he would not submit to be under the guidance of others. Thus no closer tie between Plato and Dionysius was formed; they drew together again, and again parted, so that the third visit to Sicily ended also in coldness, and the connection was not again established. This time the ill-feeling with regard to the continued relations with Dion ran so high, that when Plato wished to leave Sicily, on account of the treatment his friend had met with from Dionysius, the latter deprived him of the means of conveyance, and at last would have forcibly prevented his departure from Sicily. The Pythagoreans

of Tarentum came at length to the rescue,[6] demanded Plato back from Dionysius, got him conveyed away safely, and brought him to Greece. They were aided by the circumstance that Dionysius was afraid of an ill report being spread that he was not on good terms with Plato.[7] Thus Plato's hopes were shattered, and his dream of shaping the constitution in accordance with the demands of his own philosophic ideas, through the agency of Dionysius, proved vain.

At a later date, therefore, he actually refused to be the lawgiver of other States, though they had made application to him for that very purpose; amongst these applicants were the inhabitants of Cyrene and the Arcadians. It was a time when many of the Greek States found their constitutions unsatisfactory, and yet could not devise anything new.[8] Now in the last thirty years[9] many constitutions have been drawn up, and it would be no hard task for anyone having had much experience in this work to frame another. But theorizing is not sufficient for a constitution; it is not individuals who make it; it is something divine and spiritual, which develops in history. So strong is this power of the world-spirit that the thought of an individual is as nothing against it; and when such thoughts do count for something, *i.e.* when they can be realized, they are then none other than the product of this power of the universal spirit. The idea that Plato should become lawgiver was not adapted for the times; Solon and Lycurgus were lawgivers, but in Plato's day such a thing was impracticable. He declined any further compliance with the wishes of these States, because they would not agree to the first condition which he imposed, namely, the abolition of all private property,[10] a principle which we shall deal with later, in considering Plato's practical philosophy. Honoured thus throughout the whole land, and especially in Athens, Plato lived until the first year of the 108th Olympiad (B.C. 348); and died on his birthday, at a wedding feast, in the eighty-first year of his age.[11]

We have to speak, in the first place, of the direct mode in which Plato's philosophy has come down to us; it is to be found in those of his writings which we possess; indubitably they are one of the fairest gifts which fate has preserved from the ages that are gone. His philosophy is not, however, properly speaking, presented there in systematic form, and to construct it from such writings is difficult, not so much from anything in itself, as because this philosophy has been differently understood in different periods of time; and, more than all, because it has been much and roughly handled in modern times by those who have either read into it their own crude notions, being enable to conceive the spiritual spiritually, or have regarded as the essential and most significant element in Plato's philosophy that which in reality does not belong to Philosophy at all, but only to the mode of presentation; in truth, however, it is only ignorance of Philosophy that renders it difficult to grasp the philosophy of Plato. The form and matter of these works are alike of interest and importance. In studying them we must nevertheless make sure, in the first place, what of Philosophy we mean to seek and may find within them, and, on the other hand, what Plato's point of view never can afford us, because in his time it was not there to give. Thus it may be that the longing with which we approached Philosophy is left quite unsatisfied; it is, however, better that we should not be altogether satisfied than that such conclusions should be regarded as final. Plato's point of view is clearly defined and necessary, but it is impossible for us to remain there, or to go back to it; for Reason now makes higher demands. As for regarding it as the highest standpoint, and that which we must take for our own — it belongs to the weaknesses of our time not to be able to bear the greatness, the immensity of the claims made by the human spirit, to feel crushed before them, and to flee from them faint-hearted. We must stand above Plato, *i.e.* we must acquaint ourselves with the needs of thoughtful minds in our own time, or rather we must ourselves experience these needs.

Just as the pedagogue's aim is to train up men so as to shield them from the world, or to keep them in a particular sphere — the counting-house, for instance, or bean-planting, if you wish to be idyllic — where they will neither know the world nor be known by it; so in Philosophy a return has been made to religious faith, and therefore to the Platonic philosophy.[12] Both are moments which have their due place and their own importance, but they are not the philosophy of our time. It would be perfectly justifiable to return to Plato in order to learn anew from him the Idea of speculative Philosophy, but it is idle to speak of him with extravagant enthusiasm, as if he represented beauty and excellence in general. Moreover, it is quite superfluous for Philosophy, and belongs to the hypercriticism of our times, to treat Plato from a literary point of view, as Schleiermacher does, critically examining whether one or another of the minor dialogues is genuine or not. Regarding the more important of the dialogues, we may mention that the testimony of the ancients leaves not the slightest doubt.

Then of course the very character of Plato's works, offering us in their manysidedness various modes of treating Philosophy, constitutes the first difficulty standing in the way of a comprehension of his philosophy. If we still had the oral discourses (ἄγραφα δόγματα) of Plato, under the title "Concerning the Good" (περὶ τἀγαθοῦ), which his scholars noted down, we should have had his philosophy before us in simpler, because in more systematic form.[13] Aristotle seems to have had these discourses before him, when dealing with the philosophy of Plato, and he quotes them in his work "On Philosophy," or, "On the Ideas," or, "On the Good" (Brandis has written on this topic). But, as it happens, we have only Plato's Dialogues, and their form renders it all the more difficult for us to gather a definite idea of his philosophy. For the dialogue form contains very heterogeneous elements; Philosophy proper in the treatment of absolute Being, and,

intermingled with that, its particular mode of representation. It is just this which constitutes the manysidedness of Plato's works.

A second difficulty is said to lie in the distinction drawn between exoteric and esoteric philosophy. Tennemann (Vol. II. p. 220) says: "Plato exercised the right, which is conceded to every thinker, of communicating only so much of his discoveries as he thought good, and of so doing only to those whom he credited with capacity to receive it. Aristotle, too, had an esoteric and an exoteric philosophy, but with this difference, that in his case the distinction was merely formal, while with Plato it was also material." How nonsensical! This would appear as if the philosopher kept possession of his thoughts in the same way as of his external goods: the philosophic Idea is, however, something utterly different, and instead of being possessed by, it possesses a man. When philosophers discourse on philosophic subjects, they follow of necessity the course of their ideas; they cannot keep them in their pockets; and when one man speaks to another, if his words have any meaning at all, they must contain the idea present to him. It is easy enough to hand over an external possession, but the communication of ideas requires a certain skill; there is always something esoteric in this, something more than the merely exoteric. This difficulty is therefore trifling.

Thirdly, as one of the circumstances that render it difficult to comprehend Plato's own speculative thought, we can scarcely reckon the external consideration that in his Dialogues he does not speak in his own person, but introduces Socrates and many others as the speakers, without always making it plain which of them expresses the writer's own opinion. By reason of this historic circumstance, which seems to bear out the manysidedness of Plato, it has of course been often said, by ancients as well as moderns, that he merely expounded, from a historical point of view, the system and doctrine of Socrates, that he adapted much in the Dialogues from various Sophists, and avowedly advanced many theorems belonging to

an earlier date, especially those of the Pythagoreans, Heraclitics, and Eleatics, even adopting, in the last case, the Eleatic mode of treatment. Hence it was said that to these philosophies the whole matter of the treatise belonged, the outward form alone being Plato's. It is therefore necessary to distinguish what is peculiarly his and what is not, or whether the component parts are in harmony. In the Socratic Dialogues that we have from Cicero, the personages can be much more readily made out; but in Cicero there is nothing of real interest offered to us. With Plato there can be no talk of this ambiguity, and the difficulty is only in appearance. In the Dialogues of Plato his philosophy is quite clearly expressed; they are not constructed as are the conversations of some people, which consist of many monologues, in which one person expresses a certain opinion and another person differs from him, and both hold to their own way of thinking. Here, on the contrary, the divergency of opinions which comes out is examined, and a conclusion arrived at as to the truth; or, if the result is negative, the whole process of knowledge is what is seen in Plato. There is, therefore, no need to inquire further as to what belongs to Socrates in the Dialogues, and what belongs to Plato. This further observation we must, however, make, that since Philosophy in its ultimate essence is one and the same, every succeeding philosopher will and must take up into his own, all philosophies that went before, and what falls specially to him is their further development. Philosophy is not a thing apart, like a work of art; though even in a work of art it is the skill which the artist learns from others that he puts into practice. What is original in the artist is his conception as a whole, and the intelligent use of the means already at his command; there may occur to him in working an endless variety of ideas and discoveries of his own. But Philosophy has one thought, one reality, as its foundation; and nothing can be put in the place of the true knowledge of this already attained; it must of necessity make itself evident in later developments.

Therefore, as I have already observed (Vol. I. p. 166), Plato's Dialogues are not to be considered as if their aim were to put forward a variety of philosophies, nor as if Plato's were an eclectic philosophy derived from them; it forms rather the knot in which these abstract and one-sided principles have become truly united in a concrete fashion. In giving a general idea of the history of Philosophy, we have already seen (Vol. I. p. 54) that such points of union, in which the true is concrete, must occur in the onward course of philosophical development. The concrete is the unity of diverse determinations and principles; these, in order to be perfected, in order to come definitely before the consciousness, must first of all be presented separately. Thereby they of course acquire an aspect of one-sidedness in comparison with the higher principle which follows: this, nevertheless, does not annihilate them, nor even leave them where they were, but takes them up into itself as moments. Thus in Plato's philosophy we see all manner of philosophic teaching from earlier times absorbed into a deeper principle, and therein united. It is in this way that Plato's philosophy shows itself to be a totality of ideas: therefore, as the result, the principles of others are comprehended in itself. Frequently Plato does nothing more than explain the doctrines of earlier philosophers; and the only particular feature in his representation of them is that their scope is extended. His Timæus is, by unanimous testimony, the amplification of a still extant work of Pythagoras;[14] and, in like manner, his amplification of the doctrine of Parmenides is of such a nature that its principle is freed from its one-sided character.

These last two difficulties having been disposed of, if we would likewise solve the first mentioned, we must proceed to describe the form in which Plato has propounded his ideas, keeping it, on the other hand, distinct from Philosophy proper, as we find it with him. The form of the Platonic philosophy is, as is well known, the dialogue. The beauty of this form is

highly attractive; yet we must not think, as many do, that it is the most perfect form in which to present Philosophy; it is peculiar to Plato, and as a work of art is of course to be much esteemed.

In the first place, scenery and dramatic form belong to what is external. Plato gives to his Dialogues a setting of reality, both as regards place and persons, and chooses out some particular occasion which has brought his characters together; this in itself is very natural and charming. Socrates takes the leading part, and among the other actors there are many stars well known to us, such as Agathon, Zeno, and Aristophanes. We find ourselves in some particular spot; in the Phædrus (p. 229 Steph.; p. 6 Bekk.) it is at the plane tree beside the clear waters of the Ilyssus, through which Socrates and Phædrus pass; in other dialogues we are conducted to the halls of the gymnasia, to the Academy, or to a banquet. By never allowing himself to appear in person, but putting his thoughts always in the mouth of others, any semblance of preaching or of dogmatizing is avoided by Plato, and the narrator appears just as little as he does in the History of Thucydides or in Homer. Xenophon sometimes brings himself forward, sometimes he entirely loses sight of the aim he had in view, of vindicating by what he tells of them the life of Socrates and his method of instruction. With Plato, on the contrary, all is quite objective and plastic; and he employs great art in removing from himself all responsibility for his assertions, often assigning them even to a third or fourth person.

As regards the tone of the intercourse between the characters in these Dialogues, we find that the noblest urbanity of well-bred men reigns supreme; the Dialogues are a lesson in refinement; we see in them the *savoir faire* of a man acquainted with the world. The term courtesy does not quite express urbanity; it is too wide, and includes the additional notion of testifying respect, of expressing deference and personal obligation; urbanity is true courtesy, and forms its real basis. But urbanity makes a point of

granting complete liberty to all with whom we converse, both as regards the character and matter of their opinions, and also the right of giving expression to the same. Thus in our counter-statements and contradictions we make it evident that what we have ourselves to say against the statement made by our opponent is the mere expression of our subjective opinion; for this is a conversation carried on by persons as persons, and not objective reason talking with itself. However energetically we may then express ourselves, we must always acknowledge that our opponent is also a thinking person; just as one must not take to speaking with the air of being an oracle, nor prevent anyone else from opening his mouth in reply. This urbanity is, however, not forbearance, but rather the highest degree of frankness and candour, and it is this very characteristic which gives such gracefulness to Plato's Dialogues.

Finally, this dialogue is not a conversation, in which what is said has, and is meant to have, a merely casual connection, without any exhaustive treatment of the subject. When one talks only for amusement, the casual and arbitrary sequence of ideas is quite to be expected. In the introduction, to be sure, the Dialogues of Plato have sometimes this very character of being mere conversations, and consequently appear to take an accidental form; for Socrates is made to take his start from the particular conceptions of certain individuals, and from the circle of their ideas (Vol. I. p. 397). Later, however, these dialogues become a systematic development of the matter in hand, wherein the subjective character of the conversation disappears, and the whole course of the argument shows a beautifully consistent dialectic process. Socrates talks, turns the conversation, lays down his own views, draws a conclusion, and does all this through the apparent instrumentality of the question; most questions are so framed as to be answered by merely Yes or No. The dialogue seems to be the form best adapted for representing an argument, because it sways hither and thither; the different sides are allotted

to different persons, and thus the argument is made more animated. The dialogue has, however, this disadvantage, that it seems to be carried on arbitrarily, so that at the end the feeling always remains that the matter might have turned out differently. But in the Platonic Dialogues this arbitrary character is apparent only; it has been got rid of by limiting the development to the development of the subject in hand, and by leaving very little to be said by the second speaker. Such personages are, as we already saw in connection with Socrates (Vol. I. p. 402), plastic personages as regards the conversation; no one is put there to state his own views, or, as the French express it, *pour placer son mot*. Just as in the Catechism the answers are prescribed to the questions asked, so is it in these dialogues, for they who answer have to say what the author pleases. The question is so framed that a quite simple answer is alone possible, and, thanks to the artistic beauty and power of the dialogues, such an answer appears at the same time perfectly natural.

In the next place, there is connected with this outward aspect of personality the circumstance that the Platonic philosophy does not proclaim itself to be one particular field, where some one begins a science of his own in a sphere of his own; for it sometimes enters into the ordinary conceptions of culture, like those of Socrates, sometimes into those of the Sophists, at other times into those of earlier philosophers, and in so doing brings before us exemplifications from ordinary knowledge, and also uses the methods of the same. A systematic exposition of Philosophy we cannot in this way find; and of course it is all the less easy for us to take a comprehensive view of the subject, since there are at hand no means of judging whether the treatment has been exhaustive or not. Nevertheless, there is present there one spirit, one definite point of view as regards Philosophy, even though Mind does not make its appearance in the precise form which we demand. The philosophic culture of Plato, like the general culture of his time, was

not yet ripe for really scientific work; the Idea was still too fresh and new; it was only in Aristotle that it attained to a systematic scientific form of representation.

Connected with this deficiency in Plato’s mode of representation, there is also a deficiency in respect of the concrete determination of the Idea itself, since the various elements of the Platonic philosophy which are represented in these dialogues, namely the merely popular conceptions of Being and the apprehending knowledge of the same, are really mixed up in a loose, popular way, so that the former more especially come to be represented in a myth or parable; such intermingling is inevitable in this beginning of science proper in its true form. Plato’s lofty mind, which had a perception or conception of Mind, penetrated through his subject with the speculative Notion, but he only began to penetrate it thus, and he did not yet embrace the whole of its reality in the Notion; or the knowledge which appeared in Plato did not yet fully realize itself in him. Here it therefore happens sometimes that the ordinary conception of reality again separates itself from its Notion, and that the latter comes into opposition with it, without any statement having been made that the Notion alone constitutes reality. Thus we find Plato speaking of God, and again, in the Notion, of the absolute reality of things, but speaking of them as separated, or in a connection in which they both appear separated; and God, as an uncomprehended existence, is made to belong to the ordinary conception. Sometimes, in order to give greater completeness and reality, in place of following out the Notion, mere pictorial conceptions are introduced, myths, spontaneous imaginations of his own, or tales derived from the sensuous conception, which no doubt are determined by thought, but which this has never permeated in truth, but only in such a way that the intellectual is determined by the forms of ordinary conception. For instance, appearances of the body or of nature, which are perceptible by the senses, are brought forward along

with thoughts regarding them, which do not nearly so completely exhaust the subject as if it had been thoroughly thought out, and the Notion allowed to pursue an independent course.

Looking at this as it bears on the question of how Plato's philosophy is to be apprehended, we find, owing to these two circumstances, that either too much or too little is found in it. Too much is found by the ancients, the so-called -, who sometimes dealt with Plato's philosophy as they dealt with the Greek mythology. This they allegorized and represented as the expression of ideas — which the myths certainly are — and in the same way they first raised the ideas in Plato's myths to the rank of theorems: for the merit of Philosophy consists alone in the fact that truth is expressed in the form of the Notion. Sometimes, again, they took what with Plato is in the form of the Notion for the expression of Absolute Being — the theory of Being in the Parmenides, for instance, for the knowledge of God — just as if Plato had not himself drawn a distinction between them. But in the pure Notions of Plato the ordinary conception as such is not abrogated; either it is not said that these Notions constitute its reality, or they are to Plato no more than a conception, and not reality. Again, we certainly see that too little is found in Plato by the moderns in particular; for they attach themselves pre-eminently to the side of the ordinary conception, and see in it reality. What in Plato relates to the Notion, or what is purely speculative, is nothing more in their eyes than roaming about in abstract logical notions, or than empty subtleties: on the other hand, they take that for theorem which was enunciated as a popular conception. Thus we find in Tennemann (Vol. II. p. 376) and others an obstinate determination to lead back the Platonic Philosophy to the forms of our former metaphysic, *e.g.* to the proof of the existence of God.

However much, therefore, Plato's mythical presentation of Philosophy is praised, and however attractive it is in his Dialogues, it yet proves a source

of misapprehensions; and it is one of these misapprehensions, if Plato's myths are held to be what is most excellent in his philosophy. Many propositions, it is true, are made more easily intelligible by being presented in mythical form; nevertheless, what is not the true way of presenting them; propositions are thoughts which, in order to be pure, must be brought forward as such. The myth is always a mode of representation which, as belonging to an earlier stage, introduces sensuous images, which are directed to imagination, not to thought; in this, however, the activity of thought is suspended, it cannot yet establish itself by its own power, and so is not yet free. The myth belongs to the pedagogic stage of the human race, since it entices and allures men to occupy themselves with the content; but as it takes away from the purity of thought through sensuous forms, it cannot express the meaning of Thought. When the Notion attains its full development, it has no more need of the myth. Plato often says that it is difficult to express one's thoughts on such and such a subject, and he therefore will employ a myth; no doubt this is easier. Plato also says of simple Notions that they are dependent, transitory moments, which have their ultimate truth in God; and in this first mention of God by Plato, He is made a mere conception. Thus the manner of conception and the genuinely speculative element are confounded.

In order to gather Plato's philosophy from his dialogues, what we have to do is to distinguish what belongs to ordinary conception — especially where Plato has recourse to myths for the presentation of a philosophic idea — from the philosophic idea itself; only then do we know that what belongs only to the ordinary conception, as such, does not belong to thought, is not the essential. But if we do not recognize what is Notion, or what is speculative, there is inevitably the danger of these myths leading us to draw quite a host of maxims and theorems from the dialogues, and to give them out as Plato's philosophic propositions, while they are really nothing of the

kind, but belong entirely to the manner of presentation. Thus, for instance, in the Timæus (p. 41 Steph.; p. 43 Bekk.) Plato makes use of the form, God created the world, and the dæmons had a certain share in the work; this is spoken quite after the manner of the popular conception. If, however, it is taken as a philosophic dogma on Plato's part that God made the world, that higher beings of a spiritual kind exist, and, in the creation of the world, lent God a helping hand, we may see that this stands word for word in Plato, and yet it does not belong to his philosophy. When in pictorial fashion he says of the soul of man that it has a rational and an irrational part, this is to be taken only in a general sense; Plato does not thereby make the philosophic assertion that the soul is compounded of two kinds of substance, two kinds of thing. When he represents knowledge or learning as a process of recollection, this may be taken to mean that the soul existed before man's birth. In like manner, when he speaks of the central point of his philosophy, of Ideas, of the Universal, as the permanently self-existent, as the patterns of things sensible, we may easily be led to think of these Ideas, after the manner of the modern categories of the understanding, as substances which exist outside reality, in the Understanding of God; or on their own account and as independent — like the angels, for example. In short, all that is expressed in the manner of pictorial conception is taken by the moderns in sober earnest for philosophy. Such a representation of Plato's philosophy can be supported by Plato's own words; but one who knows what Philosophy is, cares little for such expressions, and recognizes what was Plato's true meaning.

In the account of the Platonic philosophy to which I must now proceed, the two cannot certainly be separated, but they must be noted and judged of in a very different manner from that which has prevailed amongst the moderns. We have, on the one hand, to make clear Plato's general

conception of what Philosophy and Knowledge really are, and on the other to develop the particular branches of Philosophy of which he treats.

In considering his general conception of Philosophy, the first point that strikes us is the high estimation in which Plato held Philosophy. The lofty nature of the knowledge of Philosophy deeply impressed him, and he shows a real enthusiasm for the thought which deals with the absolute. Just as the Cyrenaics treat of the relation of the existent to the individual consciousness, and the Cynics assert immediate freedom to be reality, Plato upholds the self-mediating unity of consciousness and reality, or knowledge. He everywhere expresses the most exalted ideas regarding the value of Philosophy, as also the deepest and strongest sense of the inferiority of all else; he speaks of it with the greatest energy and enthusiasm, with all the pride of science, and in a manner such as nowadays we should not venture to adopt. There is in him none of the so-called modest attitude of this science towards other spheres of knowledge, nor of man towards God. Plato has a full consciousness of how near human reason is to God, and indeed of its unity with Him. Men do not mind reading this in Plato, an ancient, because it is no longer a present thing, but were it coming from a modern philosopher, it would be taken much amiss. Philosophy to Plato is man's highest possible possession and true reality; it alone has to be sought of man. Out of many passages on this subject I shall quote in the first instance the following from the Timæus (p. 47 Steph.; p. 54 Bekk.): "Our knowledge of what is most excellent begins with the eyes. The distinction between the visible day and the night, the months and courses of the planets, have begotten a knowledge of time, and awakened a desire to know the nature of the whole. From this we then obtained Philosophy, and no greater gift than this, given by God to man, has ever come or will come."

The manner in which Plato expresses his opinions on this subject in the Republic is very well known, as it is greatly decried, because it so

completely contradicts the common ideas of men, and it is all the more surprising in that it concerns the relation of Philosophy to the state, and therefore to actuality. For before this, though a certain value might indeed be attributed to Philosophy, it still remained confined to the thoughts of the individual; here, however, it goes forth into questions of constitution, government, actuality. After Plato made Socrates, in the Republic, expound the nature of a true state, he caused Glaucon to interrupt by expressing his desire that Plato should show how it could be possible for such a state to exist. Socrates parries the question, will not come to the point, seeks evasive pleas, and tries to extricate himself by asserting that in describing what is just, he does not bind himself to show how it might be realized in actuality, though some indication must certainly be given of how an approximate, if not a complete realization of it might be possible. Finally, when pressed, he says: "Then it shall be expressed, even though a flood of laughter and utter disbelief overwhelm me. When philosophers rule the states, or the so-called kings and princes of the present time are truly and completely philosophers, when thus political greatness and Philosophy meet in one, and the many natures who now follow either side to the exclusion of the other, come together, then, and not till then, can there be an end, dear Glaucon, either to the evils of the state or, as I believe, to those of the human race. Then only will this state of which I spoke be possible or see the light of day." "This," adds Socrates, "is what I have so long hesitated to say, because I know that it is so much opposed to ordinary ideas." Plato makes Glaucon answer, "Socrates, you have expressed what, you must recollect, would cause many men, and not bad men either, to pull off their coats and seize the first weapon that comes to hand, and set upon you one and all with might and main; and if you don't know how to appease them with your reasons, you will have to answer for it."[15]

Plato here plainly asserts the necessity for thus uniting Philosophy with government. As to this demand, it may seem a piece of great presumption to say that philosophers should have the government of states accorded to them, for the territory or ground of history is different from that of Philosophy. In history, the Idea, as the absolute power, has certainly to realize itself; in other words, God rules in the world. But history is the Idea working itself out in a natural way, and not with the consciousness of the Idea. The action is certainly in accordance with general reflections on what is right, moral, and pleasing to God; but we must recognize that action represents at the same time the endeavours of the subject as such for particular ends. The realization of the Idea thus takes place through an intermingling of thoughts and Notions with immediate and particular ends. Hence it is only on the one side produced through thoughts, and on the other through circumstances, through human actions in their capacity of means. These means often seem opposed to the Idea, but that does not really matter; all those particular ends are really only means of bringing forth the Idea, because it is the absolute power. Hence the Idea comes to pass in the world, and no difficulty is caused, but it is not requisite that those who rule should have the Idea.

In order, however, to judge of the statement that the regents of the people should be philosophers, we must certainty consider what was understood by Philosophy in the Platonic sense and in the sense of the times. The word Philosophy has had in different periods very different significations. There was a time when a man who did not believe in spectres or in the devil was called a philosopher. When such ideas as these pass away, it does not occur to people to call anyone a philosopher for a reason such as this. The English consider what we call experimental physics to be Philosophy; a philosopher to them is anyone who makes investigations in, and possesses a theoretic knowledge of chemistry, mechanics, &c. (Vol. I. p. 57). In Plato Philosophy

becomes mingled with the knowledge of the supersensuous, or what to us is religious knowledge. The Platonic philosophy is thus the knowledge of the absolutely true and right, the knowledge of universal ends in the state, and the recognition of their validity. In all the history of the migration of the nations, when the Christian religion became the universal religion, the only point of interest was to conceive the supersensuous kingdom — which was at first independent, absolutely universal and true — as actualized, and to determine actuality in conformity thereto. This has been from that time forth the business of culture. A state, a government and constitution of modern times has hence quite a different basis from a state of ancient times, and particularly from one of Plato's day. The Greeks were then altogether dissatisfied with their democratic constitution, and the conditions resulting from it (*supra*, p. 8), and similarly all philosophers condemned the democracies of the Greek states in which such things as the punishment of generals (*supra*, Vol. I. p. 391) took place. In such a constitution it might certainly be thought that what was best for the state would be the first subject of consideration; but arbitrariness prevailed, and this was only temporarily restrained by preponderating individualities, or by masters in statesmanship like Aristides, Themistocles, and others. This condition of matters preceded the disintegration of the constitution. In our states, on the other hand, the end of the state, what is best for all, is immanent and efficacious in quite another way than was the case in olden times. The condition of the laws and courts of justice, of the constitution and spirit of the people, is so firmly established in itself that matters of the passing moment alone remain to be decided; and it may even be asked what, if anything, is dependent on the individual.

To us government means that in the actual state procedure will be in accordance with the nature of the thing, and since a knowledge of the Notion of the thing is requisite to this, actuality is brought into harmony

with the Notion, and thereby the Idea is realized in existence. The result of this thus is that when Plato says that philosophers should rule, he signifies the determination of the whole matter through universal principles. This is realized much more in modern states, because universal principles really form the bases — certainly not of all, but of most of them. Some have already reached this stage, others are striving to reach it, but all recognize that such principles must constitute the real substance of administration and rule.

What Plato demands is thus, in point of fact, already present. But what we call Philosophy, movement in pure thoughts, has to do with form, and this is something peculiar to itself; nevertheless, the form is not responsible if the universal, freedom, law, is not made a principle in a state. Marcus Aurelius is an example of what a philosopher upon a throne could effect; we have, however, only private actions to record of him, and the Roman Empire was made no better by him. Frederick II. was, on the other hand, justly called the philosopher king. He occupied himself with the Wolffian metaphysics and French philosophy and verses, and was thus, according to his times, a philosopher. Philosophy appears to have been an affair of his own particular inclination, and quite distinct from the fact that he was king. But he was also a philosophic king in the sense that he made for himself an entirely universal end, the well-being and good of the state, a guiding principle in his actions and in all his regulations in respect to treaties with other states, and to the rights of individuals at home; these last he entirely subordinated to absolutely universal ends. If, however, later on, procedure of this kind became ordinary custom, the succeeding princes are no longer called philosophers, even if the same principle is present to them, and the government, and especially the institutions, are founded on it.

In the Republic, Plato further speaks in a figure of the difference between a condition of philosophic culture and a lack of Philosophy: it is a

long comparison which is both striking and brilliant. The idea which he makes use of is as follows:— “Let us think of an underground den like a cave with a long entrance opening to the light. Its inhabitants are chained so that they cannot move their necks, and can see only the back of the cave. Far behind their backs a torch burns above them. In the intervening space there is a raised way and also a low wall; and behind this wall” (towards the light) “there are men who carry and raise above it all manner of statues of men and animals like puppets in a marionette show, sometimes talking to one another meanwhile, and sometimes silent. Those who are chained would see only the shadows which fall on the opposite wall, and they would take them for reality; they would hear, moreover, by means of the echo, what was said by those who moved the figures, and they would think that it was the voice of the shadows. Now if one of the prisoners were released, and compelled to turn his neck so as to see things as they are, he would think that what he saw was an illusive dream, and that the shadows were the reality. And if anyone were to take him out of the prison into the light itself, he would be dazzled by the light and could see nothing; and he would hate the person who brought him to the light, as having taken away what was to him the truth, and prepared only pain and evil in its place.”[16] This kind of myth is in harmony with the character of the Platonic philosophy, in that it separates the conception of the sensuous world present in men from the knowledge of the supersensuous.

Since we now speak more fully of this matter, we must in the second place consider the nature of knowledge according to Plato, and in so doing commence our account of the Platonic philosophy itself.

a. Plato gave a more precise definition of philosophers as those “who are eager to behold the truth.” — Glaucon: “That is quite right. But how do you explain it?” Socrates: “I tell this not to everyone, but you will agree with me in it.” “In what?” “In this, that as the Beautiful is opposed to the Ugly, they

are two things.” “Why not?” “With the Just and the Unjust, the Good and the Evil, and every other Idea (εἶδος) the case is the same, that each of them is by itself a One; on the other hand, on account of its combination with actions and bodies and other Ideas springing up on every side, each appears as a Many.” “You are right.” “I distinguish now, according to this, between the sight-loving, art-loving, busy class on the one side, and those on the other side, of whom we were just speaking as alone entitled to be called philosophers.” “What do you mean by that?” “I mean by that, such as delight in seeing and hearing, who love beautiful voices, and colours, and forms, and all that is composed thereof, while their mind is still incapable of seeing and loving the Beautiful in its own nature.” “Such is the case.” “Those, however, who have the power of passing on to the Beautiful itself, and seeing what it is in itself (καθ' αὑτό), are they not rare?” “They are indeed.” “He then who sees that beautiful things are beautiful, but does not apprehend Beauty itself, and cannot follow if another should seek to lead him to the knowledge of the same, — think you that he lives his life awake, or in a dream?” (That is to say, those who are not philosophers are like men who dream.) “For look, is it not dreaming when one in sleep, or even when awake, takes what merely resembles a certain thing to be not something that resembles it, but the very thing that it is like?” “I should certainly say of such an one that he was dreaming.” “The waking man, on the other hand, is he who holds the Beautiful itself to be the Existent, and can recognize its very self as well as that which only partakes of it (μετέχονυα), and does not confuse between the two.”[17]

In this account of Philosophy, we at once see what the so much talked of Ideas of Plato are. The Idea is nothing else than that which is known to us more familiarly by the name of the Universal, regarded, however, not as the formal Universal, which is only a property of things, but as implicitly and explicitly existent, as reality, as that which alone is true. We translate εἶδος

first of all as species or kind; and the Idea is no doubt the species, but rather as it is apprehended by and exists for Thought. Of course when we understand by species nothing but the gathering together by our reflection, and for convenience sake, of the like characteristics of several individuals as indicating their distinguishing features, we have the universal in quite an external form. But the specific character of the animal is its being alive; this being alive is that which makes it what it is, and deprived of this, it ceases to exist. To Plato, accordingly, Philosophy is really the science of this implicitly universal, to which, as contrasted with the particular, he always continues to return. "When Plato spoke of tableness and cupness, Diogenes the Cynic said: 'I see a table and a cup, to be sure, but not tableness and cupness.' 'Right,' answered Plato; 'for you have eyes wherewith to see the table and the cup, but mind, by which one sees tableness and cupness, you have not (νοῦν οὐκ ἔχεις).'"[18] What Socrates began was carried out by Plato, who acknowledged only the Universal, the Idea, the Good, as that which has existence. Through the presentation of his Ideas, Plato opened up the intellectual world, which, however, is not beyond reality, in heaven, in another place, but is the real world. With Leucippus, too, the Ideal is brought closer to reality, and not — metaphysically — thrust away behind Nature. The essence of the doctrine of Ideas is thus the view that the True is not that which exists for the senses, but that only what has its determination in itself, the implicitly and explicitly Universal, truly exists in the world; the intellectual world is therefore the True, that which is worthy to be known — indeed, the Eternal, the implicitly and explicitly divine. The differences are not essential, but only transitory; yet the Absolute of Plato, as being the one in itself and identical with itself, is at the same time concrete in itself, in that it is a movement returning into itself, and is eternally at home with itself. But love for Ideas is that which Plato calls enthusiasm.

The misapprehension of Plato’s Ideas takes two directions; one of these has to do with the thinking, which is formal, and holds as true reality the sensuous alone, or what is conceived of through the senses — this is what Plato asserts to be mere shadows. For when Plato speaks of the Universal as the real, his conception of it is met either by the statement that the Universal is present to us only as a property, and is therefore a mere thought in our understanding, or else that Plato takes this same Universal as substance, as an existence in itself, which, however, falls outside of us. When Plato further uses the expression that sensuous things are, like images (εἰκόνες), similar to that which has absolute existence, or that the Idea is their pattern and model (παραδεῖγμα), if these Ideas are not exactly made into things, they are made into a kind of transcendent existences which lie somewhere far from us in an understanding outside this world, and are pictures set up which we merely do not see; they are like the artist’s model, following which he works upon a given material, and thereon impresses the likeness of the original. And owing to their not only being removed from this sensuous present reality, which passes for truth, but also being liberated from the actuality of the individual consciousness, their subject, of which they are originally the representations, passes out of consciousness, and even comes to be represented only as something which is apart from consciousness.

The second misapprehension that prevails with regard to these Ideas takes place when they are not transferred beyond our consciousness, but pass for ideals of our reason, which are no doubt necessary, but which produce nothing that either has reality now or can ever attain to it. As in the former view the Beyond is a conception that lies outside the world, and in which species are hypostatized, so in this view our reason is just such a realm beyond reality. But when species are looked on as if they were the forms of reality in us, there is again a misapprehension, just as if they were

looked at as æsthetic in nature. By so doing, they are defined as intellectual perceptions which must present themselves immediately, and belong either to a happy genius or else to a condition of ecstasy or enthusiasm. In such a case they would be mere creations of the imagination, but this is not Plato's nor the true sense. They are not immediately in consciousness, but they are in the apprehending knowledge; and they are immediate perceptions only in so far as they are apprehending knowledge comprehended in its simplicity and in relation to the result; in other words, the immediate perception is only the moment of their simplicity. Therefore we do not possess them, they are developed in the mind through the apprehending knowledge; enthusiasm is the first rude shape they take, but knowledge first brings them to light in rational developed form; they are in this form none the less real, for they alone are Being.

On this account Plato first of all distinguishes Science, the Knowledge of the True, from opinion. "Such thinking (διάνοιαν) as of one who knows, we may justly call knowledge (γνώμην); but the other, opinion (δόξαν). Knowledge proceeds from that which is; opinion is opposed to it; but it is not the case that its content is Nothing — that would be ignorance — for when an opinion is held, it is held about Something. Opinion is thus intermediate between ignorance and science, its content is a mixture of Being and Nothing. The object of the senses, the object of opinion, the particular, only participates in the Beautiful, the Good, the Just, the Universal; but it is at the same time also ugly, evil, unjust, and so on. The double is at the same time the half. The particular is not only large or small, light or heavy, and any one of these opposites, but every particular is as much the one as the other. Such a mixture of Being and non-Being is the particular, the object of opinion;"[19] — a mixture in which the opposites have not resolved themselves into the Universal. The latter would be the

speculative Idea of knowledge, while to opinion belongs the manner of our ordinary consciousness.

b. Before we commence the examination of the objective implicitly existent content of knowledge, we must consider more in detail, on the one hand, the subjective existence of knowledge in consciousness as we find it in Plato, and, on the other, how the content is or appears in ordinary conception as soul; and the two together form the relation of knowledge, as the universal, to the individual consciousness.

α. The source through which we become conscious of the divine is the same as that already seen in Socrates (Vol. I. pp. 410, 411). The spirit of man contains reality in itself, and in order to learn what is divine he must develop it out of himself and bring it to consciousness. With the Socratics this discussion respecting the immanent nature of knowledge in the mind of man takes the form of a question as to whether virtue can be taught or not, and with the sophist Protagoras of asking whether feeling is the truth, which is allied with the question of the content of scientific knowledge, and with the distinction between that and opinion. But Plato goes on to say that the process by which we come to know is not, properly speaking, learning, for that which we appear to learn we really only recollect. Plato often comes back to this subject, but in particular he treats of the point in the Meno, in which he asserts (p. 81, 84 Steph.; p. 349, 355, 356 Bekk.) that nothing can, properly speaking, be learned, for learning is just a recollection of what we already possess, to which the perplexity in which our minds are placed, merely acts as stimulus. Plato here gives the question a speculative significance, in which the reality of knowledge, and not the empirical view of the acquisition of knowledge, is dealt with. For learning, according to the immediate ordinary conception of it, expresses the taking up of what is foreign into thinking consciousness, a mechanical mode of union and the filling of an empty space with things which are foreign and indifferent to

this space itself. An external method of effecting increase such as this, in which the soul appears to be a *tabula rasa*, and which resembles the idea we form of growth going on in the living body through the addition of particles, is dead, and is incompatible with the nature of mind, which is subjectivity, unity, being and remaining at home with itself. But Plato presents the true nature of consciousness in asserting that it is mind in which, as mind, that is already present which becomes object to consciousness, or which it explicitly becomes. This is the Notion of the true universal in its movement; of the species which is in itself its own Becoming, in that it is already implicitly what it explicitly becomes — a process in which it does not come outside of itself. Mind is this absolute species, whose process is only the continual return into itself; thus nothing is for it which it is not in itself. According to this, the process of learning is not that something foreign enters in, but that the mind's own essence becomes actualized, or it comes to the knowledge of this last. What has not yet learned is the soul, the consciousness represented as natural being. What causes the mind to turn to science is the semblance, and the confusion caused through it, of the essential nature of mind being something different, or the negative of itself — a mode of manifestation which contradicts its real nature, for it has or is the inward certainty of being all reality. In that it abrogates this semblance of other-being, it comprehends the objective, *i.e.* gives itself immediately in it the consciousness of itself, and thus attains to science. Ideas of individual, temporal, transitory things undoubtedly come from without, but not the universal thoughts which, as the true, have their root in the mind and belong to its nature; by this means all authority is destroyed.

In one sense recollection [Erinnerung] is certainly an unfortunate expression, in the sense, namely, that an idea is reproduced which has already existed at another time. But recollection has another sense, which is

given by its etymology, namely that of making oneself inward, going inward, and this is the profound meaning of the word in thought. In this sense it may undoubtedly be said that knowledge of the universal is nothing but a recollection, a going within self, and that we make that which at first shows itself in external form and determined as a manifold, into an inward, a universal, because we go into ourselves and thus bring what is inward in us into consciousness. With Plato, however, as we cannot deny, the word recollection has constantly the first and empirical sense. This comes from the fact that Plato propounds the true Notion that consciousness in itself is the content of knowledge, partly in the form of popular idea and in that of myths. Hence here even, the already mentioned (p. 18) intermingling of idea and Notion commences. In the Meno (p. 82-86 Steph.; p. 350-360 Bekk.) Socrates tries to show, by experiment on a slave who had received no instruction, that learning is a recollection. Socrates merely questions him, leaving him to answer in his own way, without either teaching him or asserting the truth of any fact, and at length brings him to the enunciation of a geometrical proposition on the relation which the diagonal of a square bears to its side. The slave obtains the knowledge out of himself alone, so that it appears as though he only recollected what he already knew but had forgotten. Now if Plato here calls this coming forth of knowledge from consciousness a recollection, it follows that this knowledge has been already in this consciousness, *i.e.* that the individual consciousness has not only the content of knowledge implicitly, in accordance with its essential nature, but has also possessed it as this individual consciousness and not as universal. But this moment of individuality belongs only to the ordinary conception, and recollection is not thought; for recollection relates to man as a sensuous "this," and not as a universal. The essential nature of the coming forth of knowledge is hence here mingled with the individual, with ordinary conception, and knowledge here appears in the form of soul, as of

the implicitly existent reality, the one, for the soul is still only a moment of spirit. As Plato here passes into a conception the content of which has no longer the pure significance of the universal, but of the individual, he further depicts it in the form of a myth. He represents the implicit existence of mind in the form of a pre-existence in time, as if the truth had already been for us in another time. But at the same time we must remark that he does not propound this as a philosophic doctrine, but in the form of a saying received from priests and priestesses who comprehend what is divine. Pindar and other holy men say the same. According to these sayings, the human soul is immortal; it both ceases to be, or, as men say, it dies, and it comes again into existence, but in no way perishes. "Now if the soul is immortal and often reappears" (metempsychosis), "and if it has seen that which is here as well as in Hades," (in unconsciousness) "and everything else, learning has no more meaning, for it only recollects what it has already known."[20] Historians seize upon this allusion to what is really an Egyptian idea, and a sensuous conception merely, and say that Plato has laid down that such and such was the case. But Plato made no such statement whatever; what he here says has nothing to do with Philosophy, and more particularly nothing to do with his philosophy, any more than what afterwards is said regarding God.

β. In other Dialogues this myth is further and more strikingly developed; it certainly employs remembrance in its ordinary sense, which is that the mind of man has in past time seen that which comes to his consciousness as the true and absolutely existent. Plato's principal effort is, however, to show through this assertion of recollection, that the mind, the soul, thought, is on its own account free, and this has to the ancients, and particularly to the Platonic idea, a close connection with what we call immortality of the soul.

αα. In the Phædrus (p. 245 Steph.; p. 38 Bekk.) Plato speaks of this in order to show that the Eros is a divine madness (μανία), and is given to us

as the greatest happiness. It is a state of enthusiasm, which here has a powerful, predominating aspiration towards the Idea (*supra*, p. 30): but it is not an enthusiasm proceeding from the heart and feeling, it is not an ordinary perception, but a consciousness and knowledge of the ideal. Plato says that he must expound the nature of the divine and human soul in order to demonstrate the Eros. "The first point is that the soul is immortal. For what moves itself is immortal and eternal, but what obtains its movement from another is transient. What moves itself is the first principle, for it certainly has its origin and first beginning in itself and derived from no other. And just as little can it cease to move, for that alone can cease which derives its motion from another." Plato thus first develops the simple Notion of the soul as of the self-moving, and, thus far, an element in mind; but the proper life of the mind in and for itself is the consciousness of the absolute nature and freedom of the "I." When we speak of the immortality of the soul, the idea is most frequently present to us that the soul is like a physical thing which has qualities of all kinds, and while these can certainly be changed, it yet seems that, as being independent of them, it is not subject to change. Now thought is one of these qualities, which are thus independent of the thing; and thought is also here defined as a thing, and as if it could pass away or cease to be. As regards this point, the main feature of the idea is that the soul should be able to subsist as an imperishable thing without having imagination, thought, &c. With Plato the immortality of the soul is, on the other hand, immediately connected with the fact that the soul is itself that which thinks; and hence that thought is not a quality of soul, but its substance. It is as with body, where the weight is not a quality, but its substance; for as the body would no longer exist if the weight were abstracted, the soul would not exist if thought were taken away. Thought is the activity of the universal, not an abstraction, but the reflection into self and the positing of self that takes place in all conceptions. Now because

thought is an eternal which remains at home with itself in every change, soul preserves its identity in what is different, just as, for instance, in sensuous perception it deals with what is different, with outside matter, and is yet at home with itself. Immortality has not then the interest to Plato which it has to us from a religious point of view; in that to him it is associated in greater measure with the nature of thought, and with the inward freedom of the same, it is connected with the determination that constitutes the principle of what is specially characteristic of Platonic philosophy, it is connected with the supersensuous groundwork which Plato has established. To Plato the immortality of the soul is hence likewise of great importance.

He proceeds: “To seek to make clear the Idea of the soul would involve investigation laborious for any but a god; but the tongue of man may speak of this more easily through a figure.” Here follows an allegory in which there is, however, something extravagant and inconsistent. He says: “The soul resembles the united power of a chariot and charioteer.” This image expresses nothing to us. “Now the horses” (the desires) “of the gods and the charioteers are good, and of a good breed. With us men, the charioteer at first takes the reins, but one of the horses only is noble and good and of noble origin; the other is ignoble and of ignoble origin. As might be expected, the driving is very difficult. How mortal differ from immortal creatures, we must endeavour to discover. The soul has the care of the inanimate everywhere, and traverses the whole heavens, passing from one idea to another. When perfect and fully winged, she soars upwards” (has elevated thoughts), “and is the ruler of the universe. But the soul whose wings droop roams about till she has found solid ground; then she takes an earthly form which is really moved by her power, and the whole, the soul and body, put together, is called a living creature, a mortal.”[21] The one is thus the soul as thought, existence in and for itself; the other is the union

with matter. This transition from thought to body is very difficult, too difficult for the ancients to understand; we shall find more about it in Aristotle. From what has been said, we may find the ground for representing Plato as maintaining the dogma that the soul existed independently prior to this life, and then lapsed into matter, united itself to it, contaminating itself by so doing, and that it is incumbent on it to leave matter again. The fact that the spiritual realizes itself from itself is a point not sufficiently examined by the ancients; they take two abstractions, soul and matter, and the connection is expressed only in the form of a deterioration on the part of soul.

"But as to the immortal," continues Plato, "if we do not express it in accordance with an apprehending thought, but form an ordinary conception of it, owing to our lack of insight and power to comprehend the nature of God, we conclude that the immortal life of God is that which has a body and soul which, however, are united in one nature (συμπεφυκότα),[22] i.e. not only externally but intrinsically made one. Soul and body are both abstractions, but life is the unity of both; and because God's nature is to popular conception the holding of body and soul unseparated in one, He is the Reason whose form and content are an undivided unity in themselves." This is an important definition of God — a great idea which is indeed none other than the definition of modern times. It signifies the identity of subjectivity and objectivity, the inseparability of the ideal and real, that is, of soul and body. The mortal and finite is, on the contrary, correctly defined by Plato as that of which the existence is not absolutely adequate to the Idea, or, more definitely, to subjectivity.

Plato now further explains what happens in the life of the divine Being, which drama the soul thus has before it, and how the wasting of its wings occurs. "The chariots of the gods enter in bands, led by Zeus, the mighty

leader, from his winged chariot. An array of other gods and goddesses follow him, marshalled in eleven bands. They present — each one fulfilling his work — the noblest and most blessed of scenes. The colourless and formless and intangible essence requires thought, the lord of the soul, as its only spectator, and thus true knowledge takes its rise. For there it sees what is (τὸ ὄν), and lives in the contemplation of reality, because it follows in an ever-recurring revolution" (of ideas). "In this revolution" (of gods), "it beholds justice, temperance, and knowledge, not in the form of what men call things, for it sees what in truth is absolute (τὸ ὄντως ὄν)." This is thus expressed as though it were something which had happened. "When the soul returns from thus beholding, the charioteer puts up his horses at the stall, gives them ambrosia to eat and nectar to drink. This is the life of the gods. But other souls, through fault of charioteer or horses, fall into confusion, with broken wings depart from these heavenly places, cease to behold the truth, nourish themselves on opinion as their food, and fall to the ground; according as a soul has beheld more or less of truth, it takes a higher or lower place. In this condition it retains a recollection of what it has seen, and if it perceives anything beautiful or right, it is rapt in amazement. The wings once more obtain strength, and the soul, particularly that of a philosopher, recollects its former condition in which, however, it had not seen what was beautiful, just, etc., but beauty and justice themselves."[23] Thus because the life of the gods is for the soul, when in individual beauty it is reminded of the universal, it is implied that in the soul, as thus absolutely existing, there is the Idea of the beautiful, good and just, as absolute and as potentially and actually universal. This constitutes the general principle of the Platonic conception. But when Plato speaks of knowledge as of a recollection, he knows all the time that this is only putting the matter in similes and metaphors; he did not ask, as theologians used gravely to do, whether the soul had existed before its birth, and, if so,

in what particular place. It cannot be said of Plato that he had any such belief, and he never speaks of the matter in the sense that theologians did; in the same way he never spoke about a Fall from a perfect state, for example, as if man had to look on the present life as an imprisonment. But what Plato expressed as the truth is that consciousness in the individual is in reason the divine reality and life; that man perceives and recognizes it in pure thought, and that this knowledge is itself the heavenly abode and movement.

ββ. Knowledge in the form of soul, is more clearly dealt with in the Phædo, where Plato has further developed the ideas about the immortality of the soul. What in the Phædrus is kept definitely apart as myth and truth respectively, and which is made to appear as such, appears less evidently so in the Phædo — that celebrated dialogue in which Plato makes Socrates speak of the immortality of the soul. That Plato should have connected this discussion with the account of the death of Socrates has in all time been matter of admiration. Nothing could seem more suitable than to place the conviction of immortality in the mouth of him who is in the act of leaving life, and to make this conviction living to us through the scene, just as, on the other hand, a death-scene like this is made living to us through that conviction. We must at the same time remark that in what is fitting the following conditions are implied. It must first be really appropriate for the dying person to occupy himself with himself instead of with the universal, with this certainty of himself as a “this” instead of with the Truth. We hence here meet with the ordinary point of view but slightly separated from that of the Notion, but, although this is so, this ordinary point of view is far removed from sinking into that coarse conception of the soul which considers it to be a thing, and asks about its continuance or subsistence as if it were a thing. Thus we find Socrates expressing himself to the effect that the body and what relates to the body is a hindrance in striving after wisdom, the sole business of Philosophy, because the sensuous perception

shows nothing purely, or as it is in itself, and what is true becomes known through the removal of the spiritual from the corporeal. For justice, beauty and such things are what alone exists in verity; they are that to which all change and decay is foreign; and these are not perceived through the body, but only in the soul.[24]

We see in this separation the essence of the soul not considered in a material category of Being, but as the universal; we see it still more in what follows, by which Plato proves immortality. A principal point in this argument is that already considered, that the soul has existed before this life, because learning is only a recollection,[25] and this implies that the soul is already implicitly what it becomes. We must not think that the bald conception of innate ideas is hereby indicated — such an expression implies the existence of ideas by nature, as though our thoughts were in part already implanted, and had in part a natural existence which did not first produce itself through the movement of the mind. But Plato mainly founds the idea of immortality on the fact that what is put together is liable to dissolution and decay, while the simple can in no manner be dissolved or destroyed; what is always like itself and the same, is, however, simple. The beautiful, the good, the like, being simple, are incapable of all change; that, on the contrary, in which these universals are, men, things, &c., are the changeable. They are perceptible by the senses, while the former is the supersensuous. Hence the soul which is in thought, and which applies itself to this, as to what is related to it, must therefore be held to have itself a simple nature.[26] Here, then, we again see that Plato does not take simplicity as the simplicity of a thing — not as if it were of anything like a chemical ingredient, for example, which can no longer be represented as inherently distinguished; this would only be empty, abstract identity or universality, the simple as an existent.

But finally the universal really does appear to take the form of an existent, as Plato makes Simmias assert: a harmony which we hear is none else than a universal, a simple which is a unity of the diverse; but this harmony is associated with a sensuous thing and disappears with it, just as music does with the lyre. On the other hand Plato makes Socrates show that the soul is not a harmony in this sense, for the sensuous harmony first exists after its elements, and is a consequence that follows from them. The harmony of the soul is, however, in and for itself, before every sensuous thing. Sensuous harmony may further have diversities within it, while the harmony of the soul has no quantitative distinction.[27] From this it is clear that Plato receives the reality of the soul entirely in the universal, and does not place its true being in sensuous individuality, and hence the immortality of the soul cannot in his case be understood in the ordinary acceptation, as that of an individual thing. Although later on we come across the myth of the sojourn of the soul after death in another and more brilliant earth,[28] we have seen above (pp. 40, 41) what kind of heaven this would be.

γ. The development and culture of the soul must be taken in connection with what precedes. However the idealism of Plato must not be thought of as being subjective idealism, and as that false idealism which has made its appearance in modern times, and which maintains that we do not learn anything, are not influenced from without, but that all conceptions are derived from out of the subject. It is often said that idealism means that the individual produces from himself all his ideas, even the most immediate. But this is an unhistoric, and quite false conception; if we take this rude definition of idealism, there have been no idealists amongst the philosophers, and Platonic idealism is certainly far removed from anything of the kind. In the seventh book of his Republic (p. 518 Steph., pp. 333, 334 Bekk.) Plato says in connection with what I have already stated (pp. 27-29), and in particular reference to the manner in which this learning is created,

by which the universal which before was secreted in the mind, developes out of it alone: “We must believe of science and learning (παιδείας), that its nature is not as some assert” (by this he means the Sophists), “who speak of culture as though knowledge were not contained within the soul, but could be implanted therein as sight into blind eyes.” The idea that knowledge comes entirely from without is in modern times found in empirical philosophies of a quite abstract and rude kind, which maintain that everything that man knows of the divine nature comes as a matter of education and habituation, and that mind is thus a quite indeterminate potentiality merely. Carried to an extreme, this is the doctrine of revelation in which everything is given from without. In the Protestant religion we do not find this rude idea in its abstract form, for the witness of the spirit is an essential part of faith, *i.e.* faith demands that the individual subjective spirit shall on its own account accept and set forth the determination which comes to it in the form of something given from without. Plato speaks against any such idea, for, in relation to the merely popularly expressed myth given above, he says: “Reason teaches that every man possesses the inherent capacities of the soul and the organ with which he learns. That is, just as we might imagine the eye not capable of turning from darkness to light otherwise than with the whole body, so must we be turned with the whole soul from the world of Becoming” (contingent feelings and ideas) “to that of Being, and the soul must gradually learn to endure this sight, and to behold the pure light of Being. But we say that this Being is the good. The art of so doing is found in culture, as being the art of the conversion of the soul — that is, the manner in which a person can most easily and effectually be converted; it does not seek to implant (ἐμποιῆσαι) sight, but — inasmuch as he already possesses it only it has not been properly turned upon himself and hence he does not see the objects that he ought to see — it brings it into operation. The other virtues of the soul are more in conformity with the

body; they are not originally in the soul, but come gradually through exercise and habit. Thought (τὸ φρονῆσαι) on the contrary, as divine, never loses its power, and only becomes good or evil through the manner of this conversion.” This is what Plato establishes in regard to the inward and the outward. Such ideas as that mind determines the good from out of itself are to us much more familiar than to Plato; but it was by Plato that they were first maintained.

c. In that Plato places truth in that alone which is produced through thought, and yet the source of knowledge is manifold — in feelings, sensations, &c. — we must state the different kinds of knowledge, as given by Plato. Plato is entirely opposed to the idea that the truth is given through sensuous consciousness, which is what is known and that from which we start; for this is the doctrine of the Sophists with which we met in dealing with Protagoras, for instance. As regards feeling, we easily make the mistake of placing everything in feeling, as indeed that Platonic rage for beauty contained the truth in the guise of feeling; but this is not the true form of the truth, because feeling is the entirely subjective consciousness. Feeling as such is merely a form with which men make the arbitrary will the principle of the truth, for what is the true content is not given through feeling; in it every content has a place. The highest content must likewise be found in feeling; to have a thing in thought and understanding is quite different from having it in heart and feeling, *i.e.* in our most inward subjectivity, in this “I”; and we say of the content that it is for the first time in its proper place when it is in the heart, because it then is entirely identical with our individuality. The mistake, however, is to say that a content is true because it is in our feeling. Hence the importance of Plato’s doctrine that the content becomes filled by thought alone; for it is the universal which can be grasped by the activity of thought alone. Plato has defined this universal content as Idea.

At the close of the sixth book of the Republic (pp. 509-511 Steph.; pp. 321-325 Bekk.) Plato distinguishes the sensuous and the intellectual in our knowledge more exactly, so that in each sphere he again presents two modes of consciousness. "In the sensuous (ὁρατόν) the one division is the external manifestation, for in it are shadows, reflections in water, and also in solid, smooth, and polished bodies, and the like. The second section, of which this is only the resemblance, includes animals, plants" (this concrete life), "and everything in art. The intelligible (νοητόν) is also divided into two parts. In the one sub-division the soul uses the sensuous figures given before, and is obliged to work on hypotheses (ἐξ ὑποθέσεων) because it does not go to the principle but to the result." Reflection, which is not on its own account sensuous, but undoubtedly belongs to thought, mingles thought with the first sensuous consciousness, although its object is not as yet a pure existence of the understanding. "The other division" (what is thought in the soul itself) "is that in which the soul, proceeding from an hypothesis, makes its way (μέθοδον) to a principle which is above hypotheses, not by means of images, as in the former cases, but through the ideas themselves. Those who study geometry, arithmetic, and kindred sciences, assume the odd and the even, the figures, three kinds of angles, and the like. And since they start from these hypotheses, they do not think it necessary to give any account of them, for everybody is supposed to know them. You further know that they make use of figures which are risible, and speak of them, although they are not thinking of them, but of the ideals which they represent; for they think of the" (absolute) "square itself and of its diagonals, and not of the" (sensuous) "images that they draw. And so it is with other things." Thus, according to Plato, this is certainly the place where real knowledge begins, because we have nothing further to do with the sensuous as such; at the same time this is not the true knowledge which considers the spiritual universal on its own account, but the arguing and

reasoning knowledge that forms universal laws and particular kinds or species out of what is sensuous. “These figures which they draw or make, and which also have shadows and images in water, they use only as images, and seek to behold their originals, which can only be seen with the understanding” (διανοίᾳ).— “That is true.”— “This I have named above that species of the intelligible, in inquiring into which the soul is compelled to use hypotheses, not proceeding to a first principle, because it is not able to get above those hypotheses, but employing those secondary images as images which are made absolutely similar to the originals in every respect”— “I understand that you are speaking of geometry and the kindred arts”— “Now learn about the other division of the intelligible in which reason (λόγος) itself is concerned, since by the power of the dialectic it makes use of hypotheses, not as principles but only as hypotheses — that is to say, as steps and points of departure in order to reach a region above hypotheses, the first principle of all” (which is in and for itself), “and clinging to this and to that which depends on this, it descends again to the result, for it requires no sensuous aid at all, but only ideas, and thus it reaches the ideas finally through the ideas themselves.” To know this is the interest and business of Philosophy; this is investigated by pure thought in and for itself, which only moves in such pure thoughts. “I understand you, but not perfectly. You seem to me to wish to assert that what is contemplated in Being and Knowledge through the science of dialectic is clearer than what is contemplated by the so-called sciences which have hypotheses as their principle, and where those who contemplate them have to do so with the understanding and not with the senses. Yet because in their contemplation they do not ascend to the absolute principle, but speculate from hypotheses, they appear not to exercise thought (νοῦν) upon these objects, although these objects are cognizable by thought if a principle is added to them (νοητῶν ὄντων μετὰ ἀρχῆς). The methods (ἕξιν) of geometry

and its kindred sciences you appear to me to call understanding; and that because it stands midway between reason (νοῦς) and 'sensuous' opinion (δόξα)."— "You have quite grasped my meaning. Corresponding to these four sections, I will suppose four faculties (παθήματα) in the soul — conceiving reason (νόησις) has the highest place (ἐπὶ τῷ ἀνωτάτῳ), understanding the second; the third is called faith (πίστις)" — the true conception for animals and plants in that they are living, homogeneous and identical with ourselves; "and the last the knowledge of images (εἰκασία)," opinion. "Arrange them according to the fact that each stage has as much clearness (σαφηνείας) as that to which it is related has truth." This is the distinction which forms the basis of Plato's philosophy, and which came to be known from his writings.

Now if we go from knowledge to its content, in which the Idea becomes sundered, and thereby organizes itself more completely into a scientific system, this content, according to Plato, begins to fall into three parts which we distinguish as the logical, natural, and mental philosophy. The logical Philosophy the ancients called dialectic, and its addition to philosophy is by the ancient writers on the subject ascribed to Plato (Vol. I. p. 387). This is not a dialectic such as we met with in the Sophists, which merely brings one's ideas altogether into confusion, for this first branch of Platonic philosophy is the dialectic which moves in pure Notions — the movement of the speculatively logical, with which several dialogues, and particularly that of Parmenides, occupy themselves. The second, according to Plato, is a kind of natural philosophy, the principles of which are more especially propounded in the Timæus. The third is the philosophy of the mind — an ethical philosophy — and its representation is essentially that of a perfect state in the Republic. The Critias should be taken in connection with the Timæus and the Republic, but we need not make further reference to it, for it is only a fragment. Plato makes these three dialogues one connected

conversation. In the Critias and the Timæus the subject is so divided that while the Timæus dealt with the speculative origin of man and of nature, the Critias was intended to represent the ideal history of human culture, and to be a philosophical history of the human race, forming the ancient history of the Athenians as preserved by the Egyptians. Of this, however, only the beginning has come down to us.[29] Hence if the Parmenides be taken along with the Republic and the Timæus, the three together constitute the whole Platonic system of philosophy divided into its three parts or sections. We now wish to consider the philosophy of Plato more in detail in accordance with these three different points of view.

1. Dialectic.

We have already remarked by way of preparation that the Notion of true dialectic is to show forth the necessary movement of pure Notions, without thereby resolving these into nothing; for the result, simply expressed, is that they are this movement, and the universal is just the unity of these opposite Notions. We certainly do not find in Plato a full consciousness that this is the nature of dialectic, but we find dialectic itself present; that is, we find absolute existence thus recognized in pure Notions, and the representation of the movement of these Notions. What makes the study of the Platonic dialectic difficult is the development and the manifestation of the universal out of ordinary conceptions. This beginning, which appears to make knowledge easier, really makes the difficulty greater, since it introduces us into a field in which there is quite a different standard from what we have in reason, and makes this field present to us; when, on the contrary, progression and motion take place in pure Notions alone, the other is not remembered at all. But in that very way the Notions attain greater truth. For otherwise pure logical movement might easily appear to us to exist on its own account, like a private territory, which has another region alongside of it, also having its own particular place. But since both are there brought

together, the speculative element begins to appear as it is in truth; that is, as being the only truth, and that, indeed, through the transformation of sensuous opinion into thought. For in our consciousness we first of all find the immediate individual, the sensuous real; or there are also categories of the understanding which are held by us to be ultimate and true. But contrasted with merely external reality, it is rather the ideal that is the most real, and it was Plato who perceived that it was the only real, for he characterized the universal or thought as the true, in opposition to what is sensuous.

Thus the aim of many of Plato's Dialogues, which conclude without any positive affirmation (Vol. I. p. 406; II. p. 13), is to show that the immediately existent, the many things that appear to us, although we may have quite true conceptions of them, are still not in themselves, in an objective sense, the true, because they alter and are determined through their relation to something else and not through themselves; thus we must even in the sensuous individuals consider the universal, or what Plato has called the Idea (p. 29). The sensuous, limited, and finite is, in fact, both itself and the other, which is also considered as existent; and thus there is an unsolved contradiction, for the other has dominion in the first. We have been before reminded (Vol. I. p. 404; II. p. 33) that the aim of the Platonic dialectic is to confuse and to resolve the finite ideas of men, in order to bring about in their consciousness what science demands, the consideration of that which is. By being thus directed against the form of the finite, dialectic has in the first place the effect of confounding the particular, and this is brought about by the negation therein present being shown forth, so that, in fact, it is proved that it is not what it is, but that it passes into its opposite, into the limitations which are essential to it. But if this dialectic is laid hold of, the particular passes away and becomes another than that which it is taken to be. Formal philosophy cannot look at dialectic in any

other way than as being the art of confusing ordinary conceptions or even Notions, and demonstrating their nullity, thus making their result to be merely negative. For this reason, Plato in his Republic (VII. pp. 538, 539, Steph.; pp. 370, 371, Bekk.) advised the citizens not to allow dialectic to be studied before the thirtieth year, because by its means anyone might transform the beautiful, as he had received it from his masters, into that which is hateful. We find this dialectic a great deal in Plato, both in the more Socratic and moralizing dialogues, and in the many dialogues which relate to the conceptions of the Sophists in regard to science.

In connection with this, the second part of dialectic makes its first aim the bringing of the universal in men to consciousness, which, as we formerly remarked when speaking of Socrates (Vol. I. p. 398), was the main interest of Socratic culture. From this time on, we may look at such an aim as having been discarded, and simply remark that a number of Plato's Dialogues merely aim at bringing to consciousness a general conception, such as we have without taking any trouble at all (Vol. I. pp. 403, 404); hence this prolixity on Plato's part often wearies us. This dialectic is, indeed, also a movement of thought, but it is really only necessary in an external way and for reflecting consciousness, in order to allow the universal, what is in and for itself, unalterable and immortal, to come forth. Hence these first two sides of the dialectic, directed as they are towards the dissolution of the particular and thus to the production of the universal, are not yet dialectic in its true form: it is a dialectic which Plato has in common with the Sophists, who understood very well how to disintegrate the particular. A subject which Plato very often treats of with this end in view, is virtue, which he proves to be only one (Vol. I. pp. 405, 411), and thereby he makes the universal good emerge from the particular virtues.

Now because the universal which has emerged from the confusion of the particular, *i.e.* the true, beautiful and good, that which taken by itself is

species, was at first undetermined and abstract, it is, in the third place, a principal part of Plato’s endeavours further to determine this universal in itself. This determination is the relation which the dialectic movement in thought bears to the universal, for through this movement the Idea comes to these thoughts which contain the opposites of the finite within themselves. For the Idea, as the self-determining, is the unity of these differences, and thus the determinate Idea. The universal is hence determined as that which resolves and has resolved the contradictions in itself, and hence it is the concrete in itself; thus this sublation of contradiction is the affirmative. Dialectic in this higher sense is the really Platonic; as speculative it does not conclude with a negative result, for it demonstrates the union of opposites which have annulled themselves. Here begins what is difficult for the understanding to grasp. The form of Plato’s methods being not yet, however, developed purely on its own account, this is the reason that his dialectic is still often merely reasoning, and that it proceeds from individual points of view and frequently remains without result. On the other hand, Plato’s own teaching is directed against this merely reasoning dialectic; yet we see that it gives him trouble properly to show forth the difference. The speculative dialectic which commences with him, is thus the most interesting but also the most difficult part of his work; hence acquaintance is not usually made with it when the Platonic writings are studied. Tennemann, for example, did not at all comprehend what was most important in the Platonic philosophy, and only gathered some of it together in the form of dry ontological determinations — for that was what he could comprehend. But it shows the greatest lack of intellect in a historian of Philosophy only to see in a great philosophic form whether there is anything yielding profit to himself or not.

What we have thus to deal with in the dialectic of Plato is the pure thought of reason, from which he very clearly distinguishes the

understanding (διάνοια), (*supra*, p. 47). We may have thoughts about many things — if indeed, we do have thought at all — but this is not what Plato means. Plato's true speculative greatness, and that through which he forms an epoch in the history of Philosophy, and hence in the history of the world, lies in the fuller determination of the Idea; this extension of knowledge is one which some centuries later constituted the main element in the ferment which took place in universal history, and in the transformation which the human mind passed through. This fuller determination may, from what has gone before, be understood thus: Plato first comprehended the Absolute as the Being of Parmenides, but as the Universal which, as species, is also end, *i.e.* which rules, penetrates, and produces the particular and manifold. Plato, however, had not yet developed this self-producing activity, and hence often stumbled into an external teleology. As the union of the preceding principles, Plato further led this Being into determinateness and into difference, as the latter is contained in the triad of Pythagorean number-determinations, and expressed the same in thought. That is, he grasped the Absolute as the unity of Being and non-being — in Becoming, as Heraclitus says — or of the one and the many,[30] &c. He further now took into the objective dialectic of Heraclitus the Eleatic dialectic, which is the external endeavour of the subject to show forth contradiction, so that in place of an external changing of things, their inward transition in themselves, *i.e.* in their Ideas, or, as they are here, in their categories, has come to pass out of and through themselves. Plato finally set forth the belief of Socrates, which the latter put forward in regard to the moral self-reflection of the subject only, as objective, as the Idea, which is both universal thought and the existent. The previous philosophies thus do not disappear because refuted by Plato, being absorbed in him.

In addition to Being and non-being, one and many, the unlimited and limiting are, for instance, likewise pure thoughts such as these, in whose

absolute contemplation, from an all-embracing point of view, the Platonic investigation occupies itself. The purely logical and quite abstruse consideration of such objects certainly contrasts strongly with our conception of the beautiful, pleasing, and attractive content of Plato. Such consideration to him signifies all that is best in Philosophy, and it is that which he everywhere calls the true method of Philosophy, and the knowledge of the truth; in it he places the distinction between philosophers and Sophists. The Sophists on their part look at appearances, and these they obtain in opinion; this, indeed, implies thought, but not pure thought, or what is in and for itself. This is one reason why many turn from the study of Plato's works unsatisfied. When we commence a Dialogue, we find, in the free Platonic method of composition, beautiful scenes in nature, a superb introduction (p. 14) that promises to lead us through flowery fields into Philosophy — and that the highest Philosophy, the Platonic. We meet with elevated thoughts, which are responded to more specially by youth, but these soon disappear. If at first we have allowed ourselves to be carried away by these bright scenes, they must now be all renounced, and as we have come to the real dialectic, and truly speculative, we must keep to the wearisome path, and allow ourselves to be pricked by the thorns and thistles of metaphysics. For behold, we then come to what is best and highest, to investigations respecting the one and many, Being and nothing; this was not what was anticipated, and men go quietly away, only wondering that Plato should seek knowledge here. From the most profound dialectic investigation, Plato then again proceeds to representations and images, to the description of dialogues amongst intelligent men. Thus in the Phædo, for example, which Mendelssohn has modernized and transformed into Wolffian metaphysics, the beginning and end are elevating and beautiful, and the middle deals with dialectic. Hence in making one's way through Plato's Dialogues very many mental qualities are called into play, and in

their study we consequently ought to keep our minds open and free as regards the very various points of interest. If we read with interest what is speculative, we are apt to overlook what is most beautiful; if our interest lies in the elevation and culture of the mind, we forget the speculative element and find that it does not appeal to us. With some it is like the young man in the Bible, who had fulfilled his various duties, and who asked Christ what good thing he still had to do to become His follower. But when the Lord commanded him to sell what he had and give to the poor, the young man went away sorrowful; this was not what he had anticipated. Just in the same way many mean well as regards Philosophy; they study Fries, and heaven knows whom else. Their hearts are full of the true, good and beautiful; they would know and see what they ought to do, but their breasts swell with goodwill alone.

While Socrates remained at the good and universal, at implicitly concrete thoughts, without having developed them or having revealed them through development, Plato certainly goes on to the Idea as determined. His defect, however, is that this determinateness and that universality are still outside one another. We should certainly obtain the determinate Idea by reducing the dialectic movement to its result, and that forms an important element in knowledge. Yet when Plato speaks of justice, beauty, goodness, truth, their origin is not revealed; they are not shown as being results, but merely as hypotheses accepted in their immediacy. Consciousness certainly has an innate conviction that they form the highest end, but this their determination is not discovered. Since Plato's dogmatic expositions of Ideas are lost (*supra*, p. 11), the dialectic of pure thought is only placed before us by the Dialogues dealing with the subject, and these, just because they deal with pure thought, are amongst the most difficult, viz.: the Sophist, the Philebus, and, more especially, the Parmenides. We here pass over the Dialogues which contain only negative dialectic and Socratic dialogue, because they

treat only of concrete ideas and not of dialectic in its higher signification; they leave us unsatisfied, because their ultimate end is only to confuse one's opinions, or awaken a sense of the necessity for knowledge. But those three express the abstract speculative Idea in its pure Notion. The embracing of the opposites in one, and the expression of this unity, is chiefly lacking in the Parmenides, which has hence, like some other Dialogues, only a negative result. But both in the Sophist and the Philebus Plato expresses the unity also.

a. The fully worked-out and genuine dialectic is, however, contained in the Parmenides — that most famous masterpiece of Platonic dialectic. Parmenides and Zeno are there represented as meeting Socrates in Athens; but the most important part of it is the dialectic which is put in the mouths of Parmenides and Zeno. At the very beginning the nature of this dialectic is given in detail as follows: Plato makes Parmenides praise Socrates thus: "I notice that in conversing with Aristoteles," (one of those present; it might quite well have been the philosopher, but that he was born sixteen years after Socrates' death) "you were trying to define in what the nature of the beautiful, just and good, and all such ideas lay. This your endeavour is noble and divine. But train and exercise yourself even more in what the multitude call idle chatter, and look on as useless, as long as you are young, for otherwise the truth will escape you. — In what, Socrates asks, does this exercise consist? — I was much pleased because you said before that we must not be content with contemplating the sensuous and its illusions, but must consider that which thought alone can grasp, and that which alone exists." I have before[31] remarked that men at all times have believed that the truth could be found through reflection only, for in reflection thought is found, and that which we have before us in the guise of ordinary conception and of belief is transformed into thought. Socrates now replies to Parmenides: "I believed that I should in that way best discern the like and

unlike, and the other general determinations in things.” Parmenides replies, “Certainly. But if you begin from a point of view such as that, you must not only consider what follows from such an hypothesis, but also what follows from the opposite of that hypothesis. For example, in the case of the hypothesis ‘the many is,’ you have to consider what will be the consequences of the relation of the many to itself and to the one, and likewise what the consequences of the relation of the one to itself and to the many.” The marvellous fact that meets us in thought when we take determinations such as these by themselves, is that each one is turned round into the opposite of itself. “But again we must consider, if the many is not, as to what will be the result as regards the one and the many, both to themselves and to one another. The same consideration must be employed in respect of identity and non-identity, rest and motion, origination and passing away, and likewise in regard to Being and non-being. We must ask what is each of these in relation to itself, and what is their relation in event of the one or the other being accepted? In exercising yourself fully in this, you will learn to know real truth.”[32] Plato thus lays great stress on the dialectical point of view, which is not the point of view of the merely external, but is a living point of view whose content is formed of pure thoughts only, whose movement consists in their making themselves the other of themselves, and thus showing that only their unity is what is truly justified.

Plato makes Socrates say, as regards the meaning of the unity of the one and many, “If anyone proved to me that I am one and many, it would not surprise me. For since he shows me that I am a many, and points out in me the right and left side, an upper and lower half, a front and back, I partake of the manifold; and again I partake of unity because I am one of us seven. The case is the same with stone, wood, &c. But if anyone, after determining the simple ideas of similarity and dissimilarity, multiplicity, and unity, rest

and movement, and so on, were to show that these in their abstract form admit of admixture and separation, I should be very much surprised."[33] The dialectic of Plato is, however, not to be regarded as complete in every regard. Though his main endeavour is to show that in every determination the opposite is contained, it can still not be said that this is strictly carried out in all his dialectic movements, for there are often external considerations which exercise an influence in his dialectic. For example, Parmenides says: "Are either of the two parts of the one which is — I mean the One and Being — ever wanting to one another? Is the One ever set free from *being* a part (τοῦ εἶναι μόριον) and Being set free from the *one* part (τοῦ ἑνὸς μόριου)? Once more, each part thus possesses both the one and Being, and the smallest part still always consists of these two parts."[34] In other words: "The one is; from this it follows that the one is not synonymous with 'is,' and thus the one and 'is' are distinguished. There hence is in the proposition 'the one is' a distinction; the many is therefore contained in it, and thus even with the one I express the many." This dialectic is certainly correct, but it is not quite pure, because it begins from this union of two determinations.

The result of the whole investigation in the Parmenides is summarized at the close by saying "that whether the one is or is not, it, as also the many (τἆλλα), in relation to themselves and in relation to one another — all of them both are and are not, appear and do not appear."[35] This result may seem strange. We are far from accepting, in our ordinary conception of things, quite abstract determinations such as the one, Being, non-being, appearance, rest, movement, &c., as Ideas; but these universals are taken by Plato as Ideas, and this Dialogue thus really contains the pure Platonic doctrine of Ideas. He shows of the one that when it is as well as when it is not, whether like itself or not like itself, both in movement and rest, origination and decay, it both is and is not; or the unity as well as all these

pure Ideas, both are and are not, the one is one as much as it is many. In the proposition “the one is,” it is also implied that “the one is not one but many;” and, conversely, “the many is” also indicates that “the many is not many, but one.” They show themselves dialectically and are really the identity with their ‘other’; and this is the truth. An example is given in Becoming: in Becoming Being and non-being are in inseparable unity, and yet they are also present there as distinguished; for Becoming only exists because the one passes into the other.

In this respect, perhaps, the result arrived at in the Parmenides may not satisfy us, since it seems to be negative in character, and not, as the negation of the negation, expressive of true affirmation. Nevertheless, the Neo-platonists, and more especially Proclus, regard the result arrived at in the Parmenides as the true theology, as the true revelation of all the mysteries of the divine essence. And it cannot be regarded as anything else, however little this may at first appear, and though Tiedemann (Platon. Argumenta, p. 340) speaks of these assertions as merely the wild extravagances of the Neo-platonists. In fact, however, we understand by God the absolute essence of things, which even in its simple Notion is the unity and movement of these pure realities, the Ideas of the one and many, &c. The divine essence is the Idea in general, as it is either for sensuous consciousness or for thought. In as far as the divine Idea is the absolute self-reflection, dialectic is nothing more than this activity of self-reflection in itself; the Neo-Platonists regarded this connection as metaphysical only, and have recognized in it their theology, the unfolding of the secrets of the divine essence. But here there appears the double interpretation already remarked upon (p. 19), which has now to be more clearly expounded. It is that God and the essential reality of things may be understood in two different ways. For, on the one hand, when it is said that the essential reality of things is the unity of opposites, it would seem as though only the

immediate essence of these immediately objective things were indicated, and as if this doctrine of real essence or ontology were distinguished from the knowledge of God, or theology. These simple realities and their relation and movement seem only to express moments of the objective and not mind, because there is lacking in them one element — that is to say, reflection into themselves — which we demand for the existence of the divine essence. For mind, the truly absolute essence, is not only the simple and immediate, but that which reflects itself into itself, for which in its opposition the unity of itself and of that which is opposed is; but these moments and their movement do not present it as such, for they make their appearance as simple abstractions. On the other hand, they may also be taken to be pure Notions, which pertain purely to reflection into itself. In this case Being is wanting to them, or what we likewise demand for reflection into itself as essential to the divine essence; and then their movement is esteemed an empty round of empty abstractions, which belong only to reflection and have no reality. For the solution of this contradiction we must know the nature of apprehension and knowledge, in order to obtain in the Notion everything there present. Thus shall we have the consciousness that the Notion is in truth neither the immediate only, although it is the simple, nor merely that which reflects itself into itself, the thing of consciousness; for it is of spiritual simplicity, thus really existent — as it is thought turned back on itself, so it is also Being in itself, *i.e.* objective Being, and consequently all reality. Plato did not state this knowledge of the nature of the Notion so expressly, nor did he say that this essential Being of things is the same as the divine essence. But really it is simply not put into words, for the fact is undoubtedly present, and the only distinction is one of speech as between the mode of the ordinary conception and that of the Notion. On the one hand, this reflection into itself, the spiritual, the Notion, is present in the speculation of Plato; for the unity of

the one and many, &c., is just this individuality in difference, this being-turned-back-within-itself in its opposite, this opposite which is implicit; the essential reality of the world is really this movement returning into itself of that which is turned back within itself. But, on the other hand, for this very reason, this being reflected into self — like the God of ordinary conception — still remains with Plato something separated; and in his representation of the Becoming of Nature in the Timæus, God, and the essential reality of things, appear as distinguished.

b. In the Sophist Plato investigated the pure Notions or Ideas of movement and rest, self-identity and other-being, Being and non-being. He here proves, as against Parmenides, that non-being is, and likewise that the simple self-identical partakes of other-being, and unity of multiplicity. He says of the Sophists that they never get beyond non-being, and he also refutes their whole ground-principle, which is non-being, feeling, and the many. Plato has thus so determined the true universal, that he makes it the unity of, for example, the one and many, Being and non-being; but at the same time he has avoided, or it was his endeavour to avoid, the double meaning which lies in our talk of the unity of Being and nothing, &c. For in this expression we emphasize the unity, and then the difference disappears, just as if we merely abstracted from it. Plato tried, however, to preserve the difference likewise. The Sophist is a further development of Being and non-being, both of which are applicable to all things; for because things are different, the one being the other of the other, the determination of the negative is present. First of all, however, Plato expresses in the Sophist a clearer consciousness of Ideas as abstract universalities, and his conviction that this point of view could not endure, because it was opposed to the unity of the Idea with itself. Plato thus first refutes what is sensuous, and then even the Ideas themselves. The first of these points of view is what is later on called materialism, which makes the corporeal alone to be the

substantial, admitting nothing to have reality excepting what can be laid hold of by the hand, such as rocks and oaks. “Let us,” says Plato, in the second place, “proceed to the other, to the friends of Ideas.” Their belief is that the substantial is incorporeal, intellectual, and they separate from it the region of Becoming, of change, into which the sensuous falls, while the universal is for itself. These represent Ideas as immovable, and neither active nor passive. Plato asserts, as against this, that movement, life, soul, and thought, cannot be denied to true Being (παντελῶς ὄντι), and that the holy reason (ἅγιον νοῦν) can be nowhere, and in nothing that is unmoved.[36] Plato thus has a clear consciousness of having got further than Parmenides when he says: —

“Keep your mind from this way of inquiry,
For never will you show that non-being is.”

Plato says that Being in anyone partakes both of Being and non-being; but what thus participates is different both from Being and non-being as such.[37]

This dialectic combats two things in particular; and in the first place it is antagonistic to the common dialectic in the ordinary sense, of which we have already spoken. Examples of this false dialectic to which Plato often comes back, are specially frequent amongst the Sophists; yet he did not show sufficiently clearly how they are distinguished from the purely dialectical knowledge which is in the Notion. For example, Plato expressed his dissent when Protagoras and others said that no determination is absolutely certain — that bitter is not objective, for what to one person is bitter, to another is sweet. Similarly, large and small, more and less, &c., are relative, because the large will be, in other circumstances, small, and the small will be great. That is to say, the unity of opposites is present to us in everything we know, but the common way of looking at things, in which the

rational does not come to consciousness, always holds the opposites asunder, as though they were simply opposed in a determinate way. As in each thing we demonstrate unity, so do we also show its multiplicity, for it has many parts and qualities. In the Parmenides, Plato, as we saw above (p. 58), objected to this unity of opposites, because it must thereby be said that something is one in quite another respect from that in which it is many. We thus do not here bring these thoughts together, for the conception and the words merely go backwards and forwards from the one to the other; if this passing to and fro is performed with consciousness, it is the empty dialectic which does not really unite the opposites. Of this Plato says, "If anyone thinks he has made a wonderful discovery in ascertaining that he can drag thoughts this way and that, from one determination to another, he may be told that he has done nothing worthy of praise; for in so doing there is nothing excellent or difficult." The dialectic that annuls a determination because it reveals in it some defect, and then goes on to establish another, is thus wrong. "The point of difficulty, and what we ought to aim at, is to show that what is the other is the same, and what is the same, is another, and likewise in the same regard and from the same point of view to show that the one has in them come into existence if the other determination is revealed within them. But to show that somehow the same is another, and the other also the same, that the great is also small" (*e.g.* Protagoras's die), "and the like also unlike, and to delight in thus always proving opposites, is no true inquiry (ἔλενχος), but simply proves that he who uses such arguments is a neophyte," in thought, "who has just begun to investigate truth. To separate all existences from one another is the crude attempt of an uncultured and unphilosophical mind. To cause everything to fall asunder means the perfect annihilation of all thought, for thought is the union of ideas."[38] Thus Plato expressly speaks against the dialectic of showing how anything may be refuted from some point of view or another. We see that

Plato, in respect of content, expresses nothing excepting what is called indifference in difference, the difference of absolute opposites and their unity. To this speculative knowledge he opposes the ordinary way of thinking, which is positive as well as negative; the former, not bringing the thoughts together, allows first one and then the other to have value in their separation; the latter is, indeed, conscious of a unity, though it is of a superficial, differentiating unity in which the two moments are separate, as standing in different aspects.

The second point against which Plato argues is the dialectic of the Eleatics, and their assertion, which in its nature resembles that of the Sophists, that only Being is, and non-being is not. To the Sophists this means, as Plato puts it: Since the negative is not, but only Being is, there is nothing false; everything existent, everything which is for us, is thus necessarily true, and what is not, we do not know or feel. Plato reproaches the Sophists for thus doing away with the difference between true and false.[39] Having arrived at this stage in the knowledge of the dialectic (and the whole matter is merely a difference of stages) the Sophists could allow what they promise — that everything that the individual, according to his belief, makes his end and interest, is affirmative and right. Hence it cannot be said that such and such an act is wrong, wicked, a crime; for this would be to say that the maxim of the action is wrong. No more can it be said that such and such opinion is deceptive, for in the opinion of the Sophists the proposition implies that what I feel or represent to myself, in as far as it is mine, is an affirmative content, and thus true and right. The proposition in itself seems quite abstract and innocent, but we first notice what is involved in such abstractions when we see them in concrete form. According to this innocent proposition there would be no wickedness and no crime. The Platonic dialectic is essentially different from this kind of dialectic.

What is further present to the mind of Plato is that the Idea, the absolute universal, good, true, and beautiful, is to be taken for itself. The myth, which I have already quoted (p. 27 *et seq.*), indeed goes to prove that we must not consider a good action, a noble man — not the subject of which these determinations are predicated. For that which appears in such conceptions or perceptions as predicate, must be taken for itself, and this is the absolute truth. This tallies with the nature of the dialectic which has been described. An action, taken in accordance with the empirical conception, may be called right; in another aspect, quite opposite determinations may be shown to be in it. But the good and true must be taken on their own account without such individualities, without this empirical and concrete character; and the good and true thus taken alone, constitute that which is. The soul which, according to the divine drama, is found in matter, rejoices in a beautiful and just object; but the only actual truth is in absolute virtue, justice, and beauty. It is thus the universal for itself which is further determined in the Platonic dialectic; of this several forms appear, but these forms are themselves still very general and abstract. Plato's highest form is the identity of Being and non-being. The true is that which is, but this Being is not without negation. Plato's object is thus to show that non-being is an essential determination in Being, and that the simple, self-identical, partakes of other-being. This unity of Being and non-being is also found in the Sophists; but this alone is not the end of the matter. For in further investigation Plato comes to the conclusion that non-being, further determined, is the essence of the 'other': "Ideas mingle, and Being and the other (θάτερον) go through everything and through one another; the other, because it participates (μετασχόν) in Being, certainly *is* through this indwelling Being, but it is not identical with that of which it partakes, being something different, and being other than Being, it is clearly non-being. But since Being likewise partakes of other-being, it also is

different from other Ideas, and is not any one of them; so that there are thousands of ways in which it is not, and as regards all else, whether looked at individually or collectively, it in many respects is, and in many respects is not."[40] Plato thus maintains that the other, as the negative, non-identical, is likewise in one and the same respect the self-identical; there are not different sides which are in mutual opposition.

These are the principal points in Plato's peculiar dialectic. The fact that the Idea of the divine, eternal, beautiful, is absolute existence, is the beginning of the elevation of consciousness into the spiritual, and into the consciousness that the universal is true. It may be enough for the ordinary idea to be animated and satisfied by the conception of the beautiful and good, but thinking knowledge demands the determination of this eternal and divine. And this determination is really only free determination which certainly does not prevent universality — a limitation (for every determination is limitation) which likewise leaves the universal in its infinitude free and independent. Freedom exists only in a return into itself; the undistinguished is the lifeless; the active, living, concrete universal is hence what inwardly distinguishes itself, but yet remains free in so doing. Now this determinateness consists in the one being identical with itself in the other, in the many, in what is distinguished. This constitutes the only truth, and the only interest for knowledge in what is called Platonic philosophy, and if this is not known, the main point of it is not known. While in the example already often quoted (pp. 58, 64),[41] in which Socrates is both one and many, the two thoughts are made to fall asunder, it is left to speculative thought alone to bring the thoughts together, and this union of what is different, of Being and non-being, of one and many, &c., which takes place without a mere transition from one to another, constitutes the inmost reality and true greatness of Platonic philosophy. This determination is the esoteric element in Platonic philosophy, and the other is the exoteric;

the distinction is doubtless an unwarranted one, indicating, as it seems to do, that Plato could have two such philosophies — one for the world, for the people, and the other, the inward, reserved for the initiated. But the esoteric is the speculative, which, even though written and printed, is yet, without being any secret, hidden from those who have not sufficient interest in it to exert themselves. To this esoteric portion pertain the two dialogues hitherto considered, along with which the Philebus may in the third place be taken.

c. In the Philebus Plato investigates the nature of pleasure; and the opposition of the infinite and finite, or of the unlimited (ἄπειρον) and limiting (πέρας), is there more especially dealt with. In keeping this before us, it would scarcely occur to us that through the metaphysical knowledge of the nature of the infinite and undetermined, what concerns enjoyment is likewise determined; but these pure thoughts are the substantial through which everything, however concrete or seemingly remote, is decided. When Plato treats of pleasure and wisdom as contrasted, it is the opposition of finite and infinite. By pleasure we certainly represent to ourselves the immediately individual, the sensuous; but pleasure is the indeterminate in respect that it is the merely elementary, like fire and water, and not the self-determining. Only the Idea is the self-determinate, or self-identity. To our reflection the infinite appears to be what is best and highest, limitation being inferior to it; and ancient philosophers so determined it. By Plato, however, it is, on the other hand, shown that the limited is the true, as the self-determining, while the unlimited is still abstract; it certainly can be determined in many different ways, but when thus determined it is only the individual. The infinite is the formless; free form as activity is the finite, which finds in the infinite the material for self-realization. Plato thus characterizes enjoyment dependent on the senses as the unlimited which does not determine itself; reason alone is the active determination. But the

infinite is what in itself passes over to the finite; thus the perfect good, according to Plato, is neither to be sought for in happiness or reason, but in a life of both combined. But wisdom, as limit, is the true cause from which what is excellent arises.[42] As that which posits measure and end, it is what absolutely determines the end — the immanent determination with which and in which freedom likewise brings itself into existence.

Plato further considers the fact that the true is the identity of opposites, thus. The infinite, as the indeterminate, is capable of a more or less, it may be more intensive or not; thus colder and warmer, drier and moister, quicker and slower, &c., are all such. What is limited is the equal, the double, and every other measure; by this means the opposite ceases to be unlike and becomes uniform and harmonious. Through the unity of these opposites, such as cold and warm, dry and moist, health arises; similarly the harmony of music takes its origin from the limitation of high tones and deep, of quicker and slower movement, and, generally speaking, everything beautiful and perfect arises through the union of opposites. Health, happiness, beauty, &c., would thus appear to be begotten, in as far as the opposites are allied thereto, but they are likewise an intermingling of the same. The ancients make copious use of intermingling, participation, &c., instead of individuality; but for us these are indefinite and inadequate expressions. But Plato says that the third, which is thus begotten, presupposes the cause or that from which it is formed; this is more excellent than those through whose instrumentality that third arose. Hence Plato has four determinations; first the unlimited, the undetermined; secondly the limited, measure, proportion, to which pertains wisdom; the third is what is mingled from both, what has only arisen; the fourth is cause. This is in itself nothing else than the unity of differences, subjectivity, power and supremacy over opposites, that which is able to sustain the opposites in itself; but it is only the spiritual which has this power and which sustains

opposition, the highest contradiction in itself. Weak corporeality passes away as soon as 'another' comes into it. The cause he speaks of is divine reason, which governs the world; the beauty of the world which is present in air, fire, water, and in all that lives, is produced thereby.[43] Thus the absolute is what in one unity is finite and infinite.

When Plato speaks thus of the beautiful and good, these are concrete ideas, or rather there is only one idea. But we are still far from these concrete ideas when we begin with such abstractions as Being, non-being, unity, and multiplicity. If Plato, however, has not succeeded in bringing these abstract thoughts through further development and concretion, to beauty, truth, and morality, there at least lies in the knowledge of those abstract determinations, the criterion by which the concrete is determined, as also its sources. This transition to the concrete is made in the Philebus, since the principle of feeling and of pleasure is there considered. The ancient philosophers knew very well what they had of concrete in those abstract thoughts. In the atomic principle of multiplicity we thus find the source of a construction of the state, for the ultimate thought-determination of such state-principles is the logical. The ancients in their pure Philosophy had not the same end in view as we — they had not the end of a metaphysical sequence placed before them like a problem. We, on the other hand, have something concrete before us, and desire to reduce it to settled order. With Plato Philosophy offers the path which the individual must follow in order to attain to any knowledge, but, generally speaking, Plato places absolute and explicit happiness, the blessed life itself, in the contemplation during life of the divine objects named above.[44] This contemplative life seems aimless, for the reason that all its interests have disappeared. But to live in freedom in the kingdom of thought had become the absolute end to the ancients, and they knew that freedom existed only in thought.

2. Philosophy of Nature.

With Plato Philosophy likewise commenced to devote more attention to the understanding of what is further determined, and in this way the matter of knowledge began to fall into divisions. In the Timæus the Idea thus makes its appearance as expressed in its concrete determinateness, and the Platonic Philosophy of Nature hence teaches us to have a better knowledge of the reality of the world; we cannot, however, enter into details, and if we did, they have little interest. It is more especially where Plato treats of physiology that his statements in no way correspond with what we now know, although we cannot fail to wonder at the brilliant glimpses of the truth there found, which have been only too much misconceived by the moderns. Plato derived a great deal from the Pythagoreans; how much is theirs, however, cannot be satisfactorily determined. We remarked before (p. 14) that the Timæus is really the fuller version of a Pythagorean treatise; other would-be wise persons have indeed said that the treatise is only an abstract made by a Pythagorean of the larger work of Plato, but the first theory is the more probable. The Timæus has in all times been esteemed the most difficult and obscure of the Platonic dialogues. This difficulty is due in part to the apparent mingling of conceiving knowledge and ordinary perception already mentioned (p. 20), just as we shall presently find an intermingling of Pythagorean numbers; and it is due still more to the philosophic nature of the matter in hand, of which Plato was as yet unconscious. The second difficulty lies in the arrangement of the whole, for what at once strikes one is that Plato repeatedly breaks off the thread of his argument, often appearing to turn back and begin again from the beginning.[45] This moved critics such as August Wolff and others, who could not understand it philosophically, to take the Timæus to be an accumulation of fragments put together, or else to be several works which had only been loosely strung together into one, or into the Platonic portion of which much

that is foreign had been introduced. Wolff accordingly thought it was evident from this that the dialogue, like Homer's poems, had been, in its first form, spoken and not written. But although the connection seems unmethodical, and Plato himself makes what maybe called copious excuses for the confusion, we shall find how the whole matter really falls into natural divisions, and we shall also find the deep inward reason which makes necessary the frequent return to what apparently is the beginning.

An exposition of the reality of nature or of the becoming of the world is introduced by Plato in the following way: "God is the Good," this stands also at the head of the Platonic Ideas in the verbally delivered discourses (*supra*, p. 11); "goodness, however, has no jealousy of anything, and being free from jealousy, God desired to make all things like Himself."[46] God here is still without determination, and a name which has no meaning for thought; nevertheless, where Plato in the Timæus again begins from the beginning, he is found to have a more definite idea of God. That God is devoid of envy undoubtedly is a great, beautiful, true, and childlike thought. With the ancients, on the contrary, we find in Nemesis, Dike, Fate, Jealousy, the one determination of the gods: moved by this they cast down the great and bring it low, and suffer not what is excellent and elevated to exist. The later high-minded philosophers controverted this doctrine. For in the mere idea of the Nemesis no moral determination is as yet implied, because punishment there is only the humiliation of what oversteps limits, but these limits are not yet presented as moral, and punishment is thus not yet a recognition of the moral as distinguished from the immoral. Plato's thought is thus much higher than that of most of our moderns, who, in saying that God is a hidden God who has not revealed Himself to us and of whom we can know nothing, ascribe jealousy to God. For why should He not reveal Himself to us if we earnestly seek the knowledge of Him? A light loses nothing by another's being kindled therefrom, and hence there was in

Athens a punishment imposed on those who did not permit this to be done. If the knowledge of God were kept from us in order that we should know only the finite and not attain to the infinite, God would be a jealous God, or God would then become an empty name. Such talk means no more than that we wish to neglect what is higher and divine, and seek after our own petty interests and opinions. This humility is sin — the sin against the Holy Ghost.

Plato continues: "God found the visible" (παραλαβών) — a mythical expression proceeding from the necessity of beginning with an immediate, which, however, as it presents itself, cannot in any way be allowed— "not at rest, but moving in an irregular and disorderly manner; and out of disorder he brought order, considering that this was far better than the other." From this it appears as if Plato had considered that God was only the δημιοῦργος, *i.e.* the disposer of matter, and that this, being eternal and independent, was found by Him as chaos; but in view of what has been said, this is false. These are not the philosophic doctrines which Plato seriously held, for he speaks here only after the manner of the ordinary conception, and such expressions have hence no philosophic content. It is only the introduction of the subject, bringing us, as it does, to determinations such as matter. Plato then comes in course of his progress to further determinations, and in these we first have the Notion; we must hold to what is speculative in Plato, and not to the first-mentioned ordinary conception. Likewise, when he says that God esteemed order to be the best, the mode of expression is naïve. Nowadays we should ask that God should first be proved; and just as little should we allow the visible to be established without much further ado. What is proved by Plato from this more naïve method of expression is, in the first place, the true determination of the Idea, which only appears later on. It is further said: "God reflecting that of what is visible, the unintelligent (ἀνόητον) could not be fairer than the intelligent (νοῦς), and

that intelligence could not exist in anything devoid of soul, for these reasons put intelligence in the soul, and the soul in the body, and so united them that the world became a living and intelligent system, an animal." We have reality and intelligence, and the soul as the bond connecting the two extremes, without which intelligence could not have part in the visible body; we saw the true reality comprehended by Plato in a similar way in the Phædrus (*supra*, p. 39). "There is, however, only one such animal, for were there two or more, these would be only parts of the one, and only one."[47]

Plato now first proceeds to the determination of the Idea of corporeal existence: "Because the world was to become corporeal, visible and tangible, and since without fire nothing can be seen, and without solidity, without earth, nothing can be touched, God in the beginning made fire and earth." In this childlike way Plato introduces these extremes, solidity and life. "But two things cannot be united without a third, there must be a bond between them, uniting both" — one of Plato's simple methods of expression. "The fairest bond, however, is that which most completely fuses itself and that which is bound by it." That is a profound saying, in which the Notion is contained; the bond is the subjective and individual, the power which dominates the other, which makes itself identical with it. "Proportion" (ἀναλογία) is best adapted to effect such a fusion; that is, whenever of three numbers or magnitudes or powers, that which is the mean is to the last term what the first term is to the mean, and again when the mean is to the first term as the last term is to the mean (a : b = b : c) "then the mean having become the first and last, and the first and last both having become means, all things will necessarily come to be the same; but having come to be the same, everything will be one."[48] This is excellent, we have still preserved this in our Philosophy; it is the distinction which is no distinction. This diremption from which Plato proceeds, is the conclusion which we know from logic; it appears in the form of the ordinary syllogism,

in which, however, the whole rationality of the Idea is, at least externally, contained. The distinctions are the extremes, and the mean is the identity which in a supreme degree makes them one; the conclusion is thus speculative, and in the extremes unites itself with itself, because all the terms pass through all the different positions. It is hence a mistake to disparage the conclusion and not to recognize it as the highest and absolute form; in respect of the conclusions arrived at by the understanding, on the contrary, we should be right in rejecting it. This last has no such mean; each of the differences is there recognized as different in its own independent form, as having a character different from that of the other. This, in the Platonic philosophy, is abrogated, and the speculative element in it constitutes the proper and true form of conclusion, in which the extremes neither remain in independence as regards themselves, nor as regards the mean. In the conclusion of the understanding, on the contrary, the unity which is constituted is only the unity of essentially different contents which remain such; for here a subject, a determination, is, through the mean, simply bound up with another, or "some conception is joined to some other conception." In a rational conclusion, however, the main point of its speculative content is the identity of the extremes which are joined to one another; in this it is involved that the subject presented in the mean is a content which does not join itself with another, but only through the other and in the other with itself. In other words, this constitutes the essential nature of God, who, when made subject, is the fact that He begot His Son, the world; but in this reality which appears as another, He still remains identical with Himself, does away with the separation implied in the Fall, and, in the other, merely unites Himself to Himself and thus becomes Spirit. When the immediate is elevated over the mediate and it is then said that God's actions are immediate, there is, indeed, good ground for the assertion; but the concrete fact is that God is a conclusion which, by differentiating

itself, unites itself to itself, and, through the abrogation of the mediation, reinstates its own immediacy. In the Platonic philosophy we thus have what is best and highest; the thoughts are, indeed, merely pure thoughts, but they contain everything in themselves; for all concrete forms depend on thought-determinations alone. The Fathers thus found in Plato the Trinity which they wished to comprehend and prove in thought: with Plato the truth really has the same determination as the Trinity. But these forms have been neglected for two thousand years since Plato's time, for they have not passed into the Christian religion as thoughts; indeed they were considered to be ideas which had entered in through error, until quite recent times, when men began to understand that the Notion is contained in these determinations, and that nature and spirit can thus be comprehended through their means.

Plato continues: "Since what is solid requires two means, because it not only has breadth but also depth, God has placed air and water between fire and earth; and indeed He gave to them the same proportion, so that fire is related to air as air to water, and as air is to water, so is water to earth."[49] Thus we have, properly speaking, four methods of representing space, inasmuch as the point is, through line and surface, closely bound up with the solid body. The sundered mean here discovered, again indicates an important thought of logical profundity; and the number four which here appears, is in nature a fundamental number. For as being the different which is turned towards the two extremes, the mean must be separated in itself. In the conclusion in which God is the One, the second (the mediating), the Son; the third, the Spirit; the mean indeed is simple. But the cause why that which in the rational conclusion is merely three-fold, passes in nature to the four-fold, rests in what is natural, because what in thought is immediately the one, becomes separate in Nature. But in order that in Nature the opposition should exist as opposition, it must itself be a twofold, and thus,

when we count, we have four. This also takes place in the conception of God, for when we apply it to the world, we have nature as mean and the existent spirit as the way of return for nature: when the return is made, this is the absolute Spirit. This living process, this separation and unifying of differences, is the living God.

Plato says further: "Through this unity the visible and tangible world has been made. And it comes to pass by God's having given to it these elements entire and unseparated, that it is perfect, and unaffected by age and disease. For old age and disease only arise from a body's being worked upon by a superabundance of such elements from without. But here this is not so, for the world contains those elements entirely in itself, and nothing can come to it from without. The world is spherical in form," (as it was to Parmenides and the Pythagoreans) "as being most perfect, and as containing all others in itself; it is perfectly smooth, since for it there is nothing outside, and it requires no limbs." Finitude consists in this, that a distinction as regards something else is an externality to some other object. In the Idea we certainly have determination, limitation, difference, other-being, but it is at the same time dissolved, contained, gathered together, in the one. Thus it is a difference through which no finitude arises, seeing that it likewise is sublated. Finitude is thus in the infinite itself, and this is, indeed, a great thought. "God gave the world the most appropriate motion of all the seven, being that which harmonizes best with mind and consciousness, motion in a circle; the other six He took away from it and liberated it from their variations"[50] (movements backwards and forwards). This is only a popular way of putting it.

We read further: "Since God wished to make the world a God, He gave it soul, and this was placed in the centre and diffused through the whole, which was also surrounded by it externally; and in this way He brought to

pass the self-sufficing existence which required no other, and which needed no other friendship or acquaintance than itself. Through these means God created the world as a blessed God." We may say that here, where the world is a totality through the world-soul, we first have the knowledge of the Idea; for the first time this newly-begotten God, as the mean and identity, is the true absolute. That first God which was only goodness, is, on the contrary, a mere hypothesis, and hence neither determined nor self-determining. "Now though we have spoken of the soul last," Plato goes on, "it does not for that reason come last; for this is merely our manner of speech. The soul is the ruler, the king, and the body is its subject." It is only Plato's naïvety which ascribes the reversal of the order of the two to a manner of speech. What here appears as contingent is really necessary — that is, to begin with the immediate and then come to the concrete. We must likewise adopt this method, but with the consciousness that when we begin with determinations such as Being, or God, Space, Time, &c., we speak of them in an immediate manner, and this content, in accordance with its nature, is at first immediate, and consequently undetermined in itself. God, for example, with whom we begin as an immediate, is proved only at the last, and then, indeed, as the true first. Thus we can, as already remarked, (p. 72) show Plato's confusion of mind in such presentations; but it depends entirely on what Plato's standard of truth is.

Plato further shows us the nature of the Idea in one of the most famous and profound of passages, where in the essence of the soul he recognizes again the very same idea that he also expressed as the essence of the corporeal. For he says: "The soul is created in the following way: Of the indivisible and unchangeable and also of the divisible which is corporeal, God made a third kind of intermediate essence, which partook of the nature of the same and of the nature of the other or diverse." (The divisible is to Plato likewise the other as such, or in itself, and not of anything else.) "And

God in like manner made the soul a sort of intermediate between the indivisible and the divisible.” Here the abstract determinations of the one which is identity, of the many or non-identical, which is opposition and difference, once more appear. If we say: “God, the Absolute, is the identity of the identical and non-identical,” a cry is raised of barbarism and scholasticism. Those who speak of it so still hold Plato in high esteem, and yet it was thus that he determined the truth. “And taking these three elements as separate, God mingled them all into one Idea, because he forcibly compressed the incongruous nature of the other into the same.”[51] This is undoubtedly the power of the Notion, which posits the many, the separate, as the ideal, and that is also the force applied to the understanding when anything is placed before it.

Plato now describes how the self-identical, as itself a moment, and the other or matter, and the third, the apparently dissoluble union which has not returned into the first unity — which three were originally separated — have now, in simple reflection into self and resumption of that beginning, been degraded into moments. “Mingling the identical and the other with the essence (οὐσία),” the third moment, “and making them all one, God again divided this whole into as many parts was as fitting.”[52] Since this substance of the soul is identical with that of the visible world, the one whole is for the first time the now systematized substance, the true matter, the absolute element which is internally divided, an enduring and unseparable unity of the one and many; and no other essence must be demanded. The manner and mode of the division of this subjectivity contain the famous Platonic numbers, which doubtless originally pertain to the Pythagoreans, and respecting which both ancients and moderns, and even Kepler himself in his *Harmonia mundi*, have taken much pains, but which no one has properly understood. To understand would mean two things, and in the first place, the recognition of their speculative significance, their Notion. But, as

already remarked of the Pythagoreans (Vol. I. p. 224), these distinctions of number give only an indefinite conception of difference, and that only in the earlier numbers; where the relationships become more complicated, they are quite incapable of designating them more closely. In the second place, because of their being numbers, they express, as differences of magnitude, differences in what is sensuous only. The system of apparent magnitude — and it is in the heavenly system that magnitude appears most purely and freely, liberated from what is qualitative — must correspond to them. But these living number-spheres are themselves systems composed of many elements — both of the magnitude of distance and of velocity and mass. No one of these elements, taken as a succession of simple numbers, can be likened to the system of heavenly spheres, for the series corresponding to this system can, as to its members, contain nothing else than the system of all these moments. Now if the Platonic numbers were also the elements of each system such as this, it would not be only this element which would have to be taken into account, for the relationship of moments which become distinguished in movement has to be conceived of as a whole, and is the true object of interest and reason. What we have to do is to give briefly the main points as matter of history; we have the most thorough treatment of it given us by Böckh "On the Constitution of the World-Soul in the Timæus of Plato," in the third volume of the Studies of Daub and Creuzer (p. 26 *et seq.*).

The fundamental series is very simple: "God first took one part out of the whole; then the second, the double of the first; the third is one and a half times as many as the second, or three times the first; the next is double the second; the fifth is three times the third; the sixth is eight times the first; the seventh is twenty-seven times greater than the first." Hence the series is: 1; 2; 3; $4 = 2^2$; $9 = 3^2$; $8 = 2^3$; $27 = 3^3$. "Then God filled up the double and triple intervals" (the relations 1 : 2 and 1 : 3) "by again abstracting portions

from the whole. These parts he placed in the intervals in such a way that in each interval there were two means, the one exceeding and exceeded by the extremes in the same ratio, the other being that kind of mean which by an equal number exceeds and is exceeded by the extremes.” That is, the first is a constant geometric relationship, and the other is an arithmetical. The first mean, brought about through the quadration, is thus in the relation 1 : 2, for example, the proportion $1 : \sqrt{2} : 2$; the other is in the same relation, the number 1½. Hereby new relations arise which are again in a specially given and more difficult method inserted into that first, but this is done in such a way that everywhere something has been left out, and the last relation of number to number is 256 : 243, or 28 : 35.

Much progress is not, however, made with these number-relations, for they do not present much to the speculative Notion. The relationships and laws of nature cannot be expressed by these barren numbers; they form an empirical relation which does not constitute the basis of the proportions of nature. Plato now says: “God divided this entire series lengthways into two parts which he set together crosswise like an X, and he bent their ends into a circular form and comprehended them in a uniform motion — forming an inner circle and an outer — and he called the motion of the outer circle the motion of the same, and that of the inner the motion of the diverse, giving supremacy to the former, and leaving it intact. But the inner motion he again split into seven orbits after the same relations; three of these he made to move with equal velocity, and four with unequal velocity to the three and to one another. This is the system of the soul within which all that is corporeal is formed; the soul is the centre, it penetrates the whole and envelopes it from without and moves in itself. Thus it has the divine beginning of a never-ceasing and rational life in itself.”[53] This is not quite devoid of confusion, and from it we can only grasp the general fact that as to Plato with the idea of the corporeal universe that of the soul enters in as

the all-embracing and simple, to him the essence of the corporeal and of the soul is unity in difference. This double essence, posited in and for itself in difference, becomes systematized within the one in many moments, which are, however, movements; thus this reality and that essence both pertain to this whole in the antithesis of soul and body, and this again is one. Mind is what penetrates all, and to it the corporeal is opposed as truly as that it itself is mind.

This is a general description of the soul which is posited in the world and reigns over it; and in as far as the substantial, which is in matter, is similar to it, their inherent identity is asserted. The fact that in it the same moments which constitute its reality are contained, merely signifies that God, as absolute Substance, does not see anything other than Himself. Plato hence describes the relation of soul to objective reality thus: it, if it touches any of the moments, whether dispersed in parts or indivisible, is stirred in all its powers to declare the sameness and the difference of that or some other thing, and how, where, and when, the individual is related to the other and to the universal. "Now when the orbit of the sensuous, moving in its due course, imparts knowledge of itself to its whole soul" (where the different orbits of the world's course show themselves to correspond with the inwardness of mind) "true opinions and beliefs arise. But when the soul applies itself to the rational and the orbit of the self-identical makes itself known, thought is perfected into knowledge."[54] This is the essential reality of the world as of the inherently blessed God; here the Idea of the whole is for the first time perfected, and, in accordance with this Idea, the world first makes its appearance. What had hitherto appeared was the reality of the sensuous only and not the world as sensuous, for though Plato certainly spoke before of fire, &c. (p. 75), he there gave only the reality of the sensuous; he would hence have done better to have omitted these expressions. In them we have the reason for its appearing as if Plato had

here begun to consider from the beginning that of which he has already treated (*supra*, p. 72). For since we must begin from the abstract in order to reach the true and the concrete, which first appears later on (*supra*, p. 79), this last, when it has been found, has the appearance and form of a new commencement, particularly in Plato's loose style.

Plato now goes on further, for he calls this divine world the pattern which is in thought (νοητόν) alone, and always in self-identity; but he again places this whole in opposition to itself, so that there is a second, the copy of the first, the world, which has origination and is visible. This second is the system of the heavenly movement, the first is the eternally living. The second, which has origination and becoming within it, cannot be made perfectly like the first, the eternal Idea. But it is made a self-moving image of the eternal that remains in the unity; and this eternal image that moves rhythmically, after the manner of numbers, is what we call time. Plato says of it that we are in the habit of calling the 'was' and 'will be' parts of time, and we transfer these indications of change which operate in time, into absolute essence. But the true time is eternal, or the present. For the substance can neither become older nor younger, and time, as the immediate image of the eternal, has neither the future nor the present in its parts. Time is ideal, like space, not sensuous, but the immediate mode in which mind comes forth in objective form, the sensuous non-sensuous. The real moments of the principle of absolute movement in what is temporal, are those in which changes appear. "From the mind and will of God in the creation of time, there arose the sun, moon, and five other stars which are called the planets, and which serve to distinguish and preserve the relations of time."[55] For in them the numbers of time are realized. Thus the heavenly movement, as the true time, is the image of the eternal which yet remains in unity, *i.e.* it is that in which the eternal retains the determination of the 'same.' For everything is in time, that is, in negative unity which does not

allow anything to root itself freely in itself, and thus to move and to be moved according to chance.

But this eternal is also in the determinateness of the other reality, in the Idea of the self-changing and variable principle whose universal is matter. The eternal world has a likeness in the world which belongs to time, but opposed to this there is a second world where change really dwells. The 'same' and the 'other' are the most abstract opposes that we hitherto have had. The eternal world as posited in time has thus two forms — the form of similarity and the form of differentiality, of variability. The three moments as they appear in the last sphere, are, in the first place, simple essence which is begotten, which has arisen, or determinate matter; secondly the place in which it is begotten, and thirdly that in which what is begotten has its pattern. Plato gives them thus: "Essence (ὄν), place, and generation." We thus have the conclusion in which space is the mean between individual generation and the universal. If we now oppose this principle to time in its negativity, the mean is this principle of the 'other' as the universal principle — "a receiving medium like a mother" — an essence which contains everything, gives to everything an independent subsistence and the power to do as is desired. This principle is destitute of form, yet capable of receiving all forms, the universal principle of all that appears different; it is the false passive matter that we understand when we speak of it — the relative substantial, existence generally, but external existence here, and only abstract Being-for-self. Form is in our reflection distinguished from it, and this, Plato tells us, first comes into existence through the mother. In this principle we have what we call the phenomenal, for matter is just this subsistence of individual generation, in which division is posited. But what appears herein is not to be posited as the individual of earthly existence, but is to be apprehended as the universal in such determinateness. Since matter, as the universal, is the principle of all that is individual, Plato in the first

place reminds us that we cannot speak of these sensuous things — fire, water, earth, air, &c. (which thus once more come before us here); for hereby they are expressed as a fixed determination which remains as such — but what remains is only their universality, or they, as universal, are only the fiery, earthly, &c.[56]

Plato further expounds the determinate reality of these sensuous things, or their simple determinateness. In this world of change form is figure in space; for as in the world, which is the immediate image of the eternal, time is the absolute principle, here the absolute ideal principle is pure matter as such, *i.e.* the existence of space. Space is the ideal essence of this phenomenal world, the mean which unites positivity and negativity, but its determinations are figures. And, indeed, of the different dimensions of space, it is surface which must be taken as true reality, for it is the absolute mean between the line and point in space, and in its first real limitation it is three; similarly the triangle is first among the figures, while the circle has no limit as such within it. Here Plato comes to the deduction of configuration, in which the triangle forms the principle; thus triangles form the essence of sensuous things. Hence he says, in Pythagorean fashion, that the compounding and uniting together of these triangles, as their Idea pertaining to the mean, constitutes once more, according to the original number-relations, the sensuous elements. This is the principle, but how Plato determines the figures of the elements, and the union of the triangles, I refrain from considering.[57]

From this point Plato passes to a system of Physics and Physiology into which we have no intention of following him. It is to be regarded as a first, childlike endeavour to understand sensuous phenomena in their manifold character, but as yet it is superficial and confused. Sensuous manifestations, such as the parts and limbs of the body, are here taken into consideration, and an account of this is given intermingled with thoughts which resemble

our formal explanations, and in which the Notion really vanishes. We have to remember the elevated nature of the Idea, as being the main point of excellence in his explanations, for, as far as the realization of the same is concerned, Plato merely felt and expressed it to be a necessity. Speculative thought is often recognizable, but, for the most part, consideration is directed to quite external modes of explanation, such as that of end. The method of treating Physics is a different one from ours, for while with Plato empirical knowledge is still deficient, in modern Physics, on the other hand, the deficiency is found in the Idea. Plato, although he does not seem to conform to our theory of Physics, ignoring as it does the theory of life, and though he proceeds to talk in a childlike way in external analogies, yet in certain cases gives utterance to very deep perceptions, which would be well worthy of our consideration if the contemplation of nature as living had any place with our physicists. His manner of relating the physiological to the physical would be as interesting. Certain portions of his system contain a general element, such as his representation of colours, and from this he goes on to more general considerations. For when Plato begins to talk on this subject, he says of the difficulty of distinguishing and recognizing the individual, that in the contemplation of nature there are "two causes to be distinguished, the one necessary and the other divine. The divine must be sought for in all things with the view of attaining to a blessed life" (this endeavour is an end in and for itself, and in it we find happiness) "in as far as our nature admits, but the necessary causes need be sought only for the sake of divine things, considering that without these necessary causes" (as conditions of knowledge) "we cannot know them." Contemplation in accordance with necessity is the external contemplation of objects, their connection, relation, &c. "Of the divine, God Himself was the creator," the divine belongs to that first eternal world — not as to one beyond, but to one now present. "But the creation and disposition of the mortal He committed

to His offspring (γεννήμασι).” This is a simple way of passing from the divine to the finite and earthly. “Now they, imitating the divine, because they had received the immortal principle of a soul, fashioned a mortal body, and placed in this a soul of another nature, which was mortal. This mortal nature was subject to violent and irresistible affections — the first of these was pleasure, the greatest incitement to evil, and then pain which is the deterrent (φυγάς) from doing good; also rashness (θάῤῥος) and fear, two foolish counsellors; anger, hope, &c. These sensations all belong to the mortal soul. And that the divine might not be polluted more than necessary, the subordinate gods separated this mortal nature from the seat of the divine, and gave it a different habitation in another part of the body, placing the neck so as to be the isthmus and boundary between head and breast.” The sensations, affections, &c., dwell in the breast or in the heart (we place that which is immortal in the heart); the spiritual is in the head. But in order to make the former as perfect as might be, “they placed,” for instance, “as a supporter to the heart which was burnt with passion, the lung, soft and bloodless, and which had within it hollows like the pores of a sponge, in order that, receiving the breath and drink, it might cool the heart and allow of refreshment and an alleviation of the heat.”[58]

What Plato says of the liver is specially worthy of notice. “Since the irrational part of the soul which desires eating and drinking does not listen to reason, God made the liver so that the soul might be inspired with terror by the power of thought which originates from reason, and which descends upon the liver as on a mirror, receiving upon it figures and giving back images. But if this part of the soul is once more assuaged, in sleep it participates in visions. For the authors of our being, remembering the command of their father to make the human race as good as they could, thus ordered our inferior parts in order that they also might obtain a measure of truth, and placed the oracle in them.” Plato thus ascribes divination to the

irrational, corporeal part of man, and although it is often thought that revelation, &c., is by Plato ascribed to reason, this is a false idea; he says that there is a reason, but in irrationality. “Herein we have a conclusive proof that God has given the art of divination to the irrationality of man, for no man when in his wits, attains prophetic truth and inspiration, but when he receives the inspiration either his intelligence is enthralled by sleep or he is demented by some distemper or possession.” Thus Plato makes divination of a lower grade than conscious knowledge. “And when he has recovered his senses he has to remember and explain what he has received, for while he is demented, he cannot judge of it. The ancient saying is therefore very true, that only a man who has his wits can act or judge about himself or his own affairs.”[59] Plato is called the patron saint of mere possession, but, according to this, the assertion is entirely false. These are the principal points in Plato’s Philosophy of Nature.

3. Philosophy of Mind.

We have already dealt generally from the theoretical side with the speculative nature of mind as yet unrealized, as well as with the highly important differences with respect to the kinds of knowledge (pp. 28-48). It must also be considered that we find in Plato as yet no developed consciousness of the organization of the theoretic mind, though certainly sensation, memory, &c., are distinguished by him from reason; these moments of the mind are, however, neither accurately discriminated, nor exhibited in their connection, so as to show the necessary relations between them. The only point of interest for us then in Plato’s philosophy of mind is his view of man’s moral nature; and this real, practical side of consciousness is Plato’s greatest glory, and hence must now be specially dealt with by us. Its form certainly does not suggest that Plato gave himself much trouble to discover a supreme moral principle, as it is now called,

which, for the very reason that it is supposed to be all-embracing, has in it a certain lack of content. Neither did he trouble himself about a natural right, which is but a trivial abstraction foisted on to the real practical existence, the right; but it is of man's moral nature that he treats in the Republic. Man's moral nature seems to us to have little to do with the State; to Plato, however, the reality of mind — that is, of mind as opposed to nature — appeared in its highest truth as the organization of a state which, as such, is essentially moral; and he recognized that the moral nature (free will in its rationality) comes to its right, to its reality, only in an actual nation.

We must further remark that in the Republic Plato introduces the investigation of his subject with the object of showing what justice (δικαιοσύνη) is. After much discussion has taken place, and several definitions of justice have been taken into consideration only to be rejected, Plato at last says in his simple way: "The present investigation is very like the case of a man who is required to read small handwriting at a distance; if it were observed that the same letters were to be seen at a shorter distance and of a larger size, he would certainly prefer to read first the letters where they were written larger, and then would be able to read more easily the small letters also. The same plan should be followed now with justice. Justice is not only in the individual, but also in the state, and the state is greater than the individual; justice is therefore imprinted on states in larger characters, and is more easily recognizable." (This is different from what the Stoics say of the wise man.) "It is therefore preferable to consider justice as it is to be found in the state."[60] By making this comparison Plato transforms the question anent justice into an investigation of the state; it is a very simple and graceful transition, though it seems arbitrary. It was great force of insight that really led the ancients to the truth; and what Plato brings forward as merely simplifying the difficulty, may, in fact, be said to exist in the nature of the thing. For it is not convenience which leads him to

this position, but the fact that justice can be carried out only in so far as man is a member of a state, for in the state alone is justice present in reality and truth. Justice, not as the understanding, but as mind in its striving to realize itself, is the existence of freedom here and now, the actuality of the self-conscious, intelligent existence in and at home with itself and possessing activity — just as in property, for instance, I place my freedom in this particular thing. But the principle of the state again is the objective reality of justice, the reality in which the whole mind is present and not only the knowledge of myself as this individual. For as the free and reasonable will determines itself, there are laws of freedom; but these laws are nothing else than state-laws, for the Notion of the state implies the existence of a reasoning will. Thus laws have force in the state, and are there matter of practice and of custom; but because self-will is also there in its immediacy, they are not only matter of custom, but must also be a force operating against arbitrary self-will, and showing itself in the courts of justice and in governments. Thus Plato, in order to discern the features of justice, with the instinct of reason fixes his attention on their manner of representation in the state.

Justice in itself is ordinarily represented by us in the form of a natural right, right in a condition of nature; such a condition of nature is, however, a direct moral impossibility. That which is in itself is, by those who do not attain to the universal, held to be something natural, as the necessary moments of the mind are held to be innate ideas. The natural is rather what should be sublated by the mind, and the justice of the condition of nature can only emerge as the absolute injustice of the mind. In contrast with the state, which is the real spirit, the spirit in its simple and as yet unrealized Notion is the abstract implicitude; this Notion must of course precede the construction of its reality; it is this which is conceived of as a condition of nature. We are accustomed to take our start from the fiction of a condition

of nature, which is truly no condition of mind, of reasonable will, but of animals among themselves: wherefore Hobbes has justly remarked that the true state of nature is a war of every man against his neighbour. This implicitude of the mind is at the same time the individual man, for in the ordinary conception the universal separates itself from the particular, as if the particular were absolutely and in and for itself what it certainly is, and the Universal did not make it that which it is in truth — as if this were not its essence, but as if the individual element were the most important. The fiction of a state of nature starts from the individuality of the person, his free will, and his relation to other persons according to this free will. Natural justice has thus been a term applied to that which is justice in the individual and for the individual; and the condition of society and of the state has been recognized only as a medium for the individual person, who is the chief end and object. Plato, in direct contrast with this, lays as his foundation the substantial, the universal, and he does this in such a way that the individual as such has this very universal as his end, and the subject has his will, activity, life and enjoyment in the state, so that it may be called his second nature, his habits and his customs. This moral substance which constitutes the spirit, life and Being of individuality, and which is its foundation, systematizes itself into a living, organic whole, and at the same time it differentiates itself into its members, whose activity signifies the production of the whole.

This relation of the Notion to its reality certainly did not come into consciousness with Plato, and thus we do not find in him a philosophic method of construction, which shows first the absolute Idea, then the necessity, inherently existent, for its realization, and this realization itself. The judgment that has been delivered respecting Plato's Republic therefore is that Plato has therein given a so-called ideal for the constitution of a state; this has become proverbial as a *sobriquet*, in the sense that this conception

is a chimera, which may be mentally conceived of — and in itself, as Plato describes it, it is doubtless excellent and true — that it is also capable of being carried out, but only on the condition that men should be of an excellence such as may possibly be present among the dwellers in the moon, but that it is not realizable for men like those on the earth. But since men most be taken as they are, this ideal cannot be realized by reason of men's wickedness; and to frame such an ideal is therefore altogether idle.

As to this, the first remark to be made is that in the Christian world in general there passes current an ideal of a perfect man which certainly cannot be carried out in the great body of a nation. We may, perhaps, see it realized in monks or Quakers, or other similar pious folk, but a set of melancholy specimens such as these could never form a nation, any more than lice or parasitic plants could exist for themselves, or otherwise than on an organic body. If such men were to constitute a nation, there would have to be an end of this lamb-like gentleness, this vanity which occupies itself exclusively with its own individual self, which pets and pampers itself, and ever has the image and consciousness of its own excellence before its eyes. For life in the universal and for the universal demands, not that lame and cowardly gentleness, but gentleness combined with a like measure of energy, and which is not occupied with itself and its own sins, but with the universal and what is to be done for it. They before whose eyes that false ideal floats of course find men to be always compassed with weakness and depravity, and never find that ideal realized. For they raise into importance the veriest trifles, which no reasonable man would give heed to; and they think such weaknesses and defects are present even when they overlook them. But we need not esteem this forbearance to be generosity; for it rather implies a perception on their part that from what they call weakness and defect proceeds their own destruction, which comes to pass from their making such defects of importance. The man who has them is immediately

through himself absolved from them, in so far as he makes nothing of them. The crime is a crime only when they are real to him, and his destruction is in holding them to be something real. Such an ideal must therefore not stand in our way, whatever be the fairness of its form, and this even when it does not appear exactly as it does to monks and Quakers, but, for instance, when it is the principle of renouncing sensuous things, and abandoning energy of action, which principle must bring to nought much that would otherwise be held of value. It is contradictory to try to keep intact all our relationships, for in those that otherwise hold good there always is a side where opposition is encountered. Moreover, what I have already said regarding the relation between philosophy and the state (p. 23 *et seq.*) shows that the Platonic ideal is not to be taken in this sense. When an ideal has truth in itself through the Notion, it is no chimera, just because it is true, for the truth is no chimera. Such an idea is therefore nothing idle and powerless, but the real. It is certainly permissible to form wishes, but when pious wishes are all that a man has in regard to the great and true, he may be said to be godless. It is just as if we could do nothing, because everything was so holy and inviolable, or as if we refused to be anything definite, because all that is definite has its defects. The true ideal is not what ought to be real, but what is real, and the only real; if an ideal is held to be too good to exist, there must be some fault in the ideal itself, for which reality is too good. The Platonic Republic would thus be a chimera, not because excellence such as it depicts is lacking to mankind, but because it, this excellence, falls short of man's requirements. For what is real, is rational. The point to know, however, is what exactly is real; in common life all is real, but there is a difference between the phenomenal world and reality. The real has also an external existence, which displays arbitrariness and contingency, like a tree, a house, a plant, which in nature come into existence. What is on the surface in the moral sphere, men's action, involves much that is evil, and

might in many ways be better; men will ever be wicked and depraved, but this is not the Idea. If the reality of the substance is recognized, the surface where the passions battle must be penetrated. The temporal and transitory certainly exists, and may cause us trouble enough, but in spite of that it is no true reality, any more than the particularity of the subject, his wishes and inclinations, are so.

In connection with this observation, the distinction is to be called to mind which was drawn when we were speaking above (pp. 84, 88) of Plato's Philosophy of Nature: the eternal world, as God holy in Himself, is reality, not a world above us or beyond, but the present world looked at in its truth, and not as it meets the senses of those who hear, see, &c. When we thus study the content of the Platonic Idea, it will become clear that Plato has, in fact, represented Greek morality according to its substantial mode, for it is the Greek state-life which constitutes the true content of the Platonic Republic. Plato is not the man to dabble in abstract theories and principles; his truth-loving mind has recognized and represented the truth, and this could not be anything else than the truth of the world he lived in, the truth of the one spirit which lived in him as well as in Greece. No man can overleap his time, the spirit of his time is his spirit also; but the point at issue is, to recognize that spirit by its content.

On the other hand, a constitution that would be perfect in respect to one nation, is to be regarded as not, perhaps, suitable for every nation. Thus, when it is said that a true constitution does not do for men as they now are, we must no doubt keep in mind that the more excellent a nation's constitution is, it renders the nation also so much the more excellent; but, on the other hand, since the morals commonly practised form the living constitution, the constitution in its abstraction is nothing at all in its independence; it must relate itself to the common morality, and be filled with the living spirit of the people. It can, therefore, certainly not be said

that a true constitution suits any and every nation; and it is quite the case that for men as they are — for instance, as they are Iroquois, Russians, French — not every constitution is adapted. For the nation has its place in history. But as the individual man is trained in the state, that is, as individuality is raised into universality, and the child grows into a man, so is every nation trained; or barbarism, the condition in which the nation is a child, passes over into a rational condition. Men do not remain at a standstill, they alter, as likewise do their constitutions. And the question here is, What is the true constitution which the nation must advance towards; just as it is a question which is the true science of mathematics or of anything else, but not whether children or boys should possess this science, as they must rather be first so educated that they may be capable of understanding it. Thus the true constitution stands before the nation of history, so that it may advance towards it. Every nation in course of time makes such alterations in its existing constitution as will bring it nearer to the true constitution. The nation's mind itself shakes off its leading-strings, and the constitution expresses the consciousness of what it is in itself, — the form of truth, of self-knowledge. If a nation can no longer accept as implicitly true what its constitution expresses to it as the truth, if its consciousness or Notion and its actuality are not at one, then the nation's mind is torn asunder. Two things may then occur. First, the nation may either by a supreme internal effort dash into fragments this law which still claims authority, or it may more quietly and slowly effect changes on the yet operative law, which is, however, no longer true morality, but which the mind has already passed beyond. In the second place, a nation's intelligence and strength may not suffice for this, and it may hold to the lower law; or it may happen that another nation has reached its higher constitution, thereby rising in the scale, and the first gives up its nationality and becomes subject to the other. Therefore it is of essential importance to know what the true

constitution is; for what is in opposition to it has no stability, no truth, and passes away. It has a temporary existence, but cannot hold its ground; it has been accepted, but cannot secure permanent acceptance; that it must be cast aside, lies in the very nature of the constitution. This insight can be reached through Philosophy alone. Revolutions take place in a state without the slightest violence when the insight becomes universal; institutions, somehow or other, crumble and disappear, each man agrees to give up his right. A government must, however, recognize that the time for this has come; should it, on the contrary, knowing not the truth, cling to temporary institutions, taking what — though recognized — is unessential, to be a bulwark guarding it from the essential (and the essential is what is contained in the Idea), that government will fall, along with its institutions, before the force of mind. The breaking up of its government breaks up the nation itself; a new government arises, — or it may be that the government and the unessential retain the upper hand.

Thus the main thought which forms the groundwork of Plato's Republic is the same which is to be regarded as the principle of the common Greek morality, namely, that established morality has in general the relation of the substantial, and therefore is maintained as divine. This is without question the fundamental determination. The determination which stands in contrast to this substantial relation of the individual to established morality, is the subjective will of the individual, reflective morality. This exists when individuals, instead of being moved to action by respect and reverence for the institutions of the state and of the fatherland, from their own convictions, and after moral deliberation, come of themselves to a decision, and determine their actions accordingly. This principle of subjective freedom is a later growth, it is the principle of our modern days of culture: it, however, entered also into the Greek world, but as the principle of the destruction of Greek state-life. It was looked on as a crime, because the

spirit, political constitution, and laws of the Greeks were not, and could not be calculated to admit of the rise of this principle within them. Because these two elements were not homogeneous, traditional and conventional morality in Greece was overthrown. Plato recognized and caught up the true spirit of his times, and brought it forward in a more definite way, in that he desired to make this new principle an impossibility in his Republic. It is thus a substantial position on which Plato takes his stand, seeing that the substantial of his time forms his basis, but this standpoint is at the same time relative only, in so far as it is but a Greek standpoint, and the later principle is consciously banished. This is the universal of Plato's ideal of the state, and it is from this point of view that we must regard it. Investigations as to whether such a state is possible, and the best possible, which start from quite modern points of view, can only lead us astray. In modern states we have freedom of conscience, according to which every individual may demand the right of following out his own interests; but this is excluded from the Platonic idea.

a. I will now indicate more fully the main features, in so far as they possess philosophic interest. Though Plato represents what the state is in its truth, yet this state has a limit, which we shall learn to know, namely, that the individual — in formal justice — is not opposed to this universality, as in the dead constitution of the ideal states founded on the theory of legal right. The content is but the whole; the nature of the individual, no doubt, but as reflecting itself into the universal, not unbending, or as having absolute validity; so that practically the state and the individual are the same in essence. Because Plato thus takes his start from that justice which implies that the just man exists only as a moral member of the state, in dealing with his subject in greater detail, in order to show how this reality of the substantial mind is produced, he in the first place opens up before us the organism of the moral commonwealth, *i.e.* the differences which lie in the

Notion of moral substance. Through the development of these moments it becomes living and existing, but these moments are not independent, for they are held in unity. Plato regards these moments of the moral organism under three aspects, first, as they exist in the state as classes; secondly, as virtues, or moments in morality; thirdly, as moments of the individual subject, in the empirical actions of the will. Plato does not preach the morality of reflection, he shows how traditional morality has a living movement in itself; he demonstrates its functions, its inward organism. For it is inner systematization, as in organic life, and not solid, dead unity, like that of metals, which comes to pass by means of the different functions of the organs which go to make up this living, self-moving unity.

α. Without classes, without this division into great masses, the state has no organism; these great distinctions are the distinction of the substantial. The opposition which first comes before us in the state is that of the universal, in the form of state life and business, and the individual, as life and work for the individual; these two fields of activity are so distinct that one class is assigned to the one, and another to the other. Plato further cites three systems of reality in the moral, the functions (αα) of legislation, counsel, in short, of diligence and foresight in the general behalf, in the interest of the whole as such; (ββ) of defence of the commonwealth against foes from without; (γγ) of care for the individual, the supplying of wants, agriculture, cattle-rearing, the manufacture of clothing and utensils, the building of houses, &c. Speaking generally, this is quite as it should be, and yet it appears to be rather the satisfaction of external necessities, because such wants are found without being developed out of the Idea of mind itself. Further, these distinct functions are allotted to different systems, being assigned to a certain number of individuals specially set apart for the purpose, and this brings about the separate classes of the state, as Plato is altogether opposed to the superficial conception that one and the same must

be everything at one time. He accordingly represents three classes, (αα) that of the governors, men of learning and wisdom, (ββ) that of the warriors, (γγ) that of the producers of necessaries, the husbandmen and handicraftsmen. The first he also speaks of as guardians (φύλακας), who are really philosophically educated statesmen, possessing true knowledge; they have the warriors to work on their behalf (ἐπικούρους τε καὶ βοηθούς), but in such a way that there is no line of separation between the civil and military classes, both being united,[61] and the most advanced in years are the guardians.[62] Although Plato does not deduce this division of the classes, they follow from the constitution of the Platonic state, and every state is necessarily a system within itself of these systems. Plato then passes on to particular determinations, which are in some measure trifling, and might with advantage have been dispensed with; for instance, among other things, he goes so far as to settle for the highest rank their special titles, and he states what should be the duties of the nurses.[63]

β. Then Plato points out that the moments which are here realized in the classes, are moral qualities which are present in individuals, and form their true essence, the simple ethical Notion divided into its universal determinations. For he states as the result of this distinction of the classes that through such an organism all virtues are present in the commonwealth; he distinguishes four of these,[64] and they have been named cardinal virtues.

αα. Wisdom (σοφία) or knowledge appears as the first virtue; such a state will be wise and good in counsel, not because of the various kinds of knowledge therein present which have to do with the many particular ordinary occupations falling to the multitude, such as the trade of blacksmith, and the tillage of the soil (in short, what we should call skill in the industrial arts, and in finance). The state is called wise, by reason of the true knowledge which is realized in the presiding and governing class, who

advise regarding the whole state, and decide upon the policy that is best, both at home and in relation to foreign states. This faculty of perception is properly the peculiar possession of the smallest class.[65]

ββ. The second virtue is courage (ἀνδρία) which Plato defines as a firm opinion about what may justly and lawfully be considered an object of fear, courage which, in its strength of purpose, remains unshaken either by desires or pleasures. To this virtue corresponds the class of the warriors.[66]

γγ. The third virtue is temperance (σωφροσύνη), the mastery over the desires and passions, which like a harmony pervades the whole; so that, whether understanding, or strength, or numbers, or wealth, or anything else be regarded, the weaker and the stronger work together for one and the same object, and are in agreement one with another. This virtue therefore is not, like wisdom and courage, confined to one part of the state, but like a harmony it is shared by governors and governed alike, and is the virtue of all classes.[67] Notwithstanding that this temperance is the harmony in which all work towards one end, it is yet peculiarly the virtue of the third class, to whom it is allotted to procure the necessaries of life by work, although at the first glance the one does not appear to have much correspondence with the other. But this virtue is present precisely when no moment, no determination or particularity isolates itself; or, more closely viewed in a moral aspect, it is when no want asserts its reality and thus becomes a crime. Now work is just this moment of activity concentrating itself on the particular, which nevertheless goes back into the universal, and is for it. Therefore, if this virtue is universal, it yet has special application to the third class, which at first is the only one to be brought into harmony, as it has not the absolute harmony which the other classes possess in themselves.

δδ. Finally, the fourth virtue is justice, which was what Plato began by considering. This, as right-doing, is to be found in the state when each individual does only one kind of work for the state, that work for which by

the original constitution of his nature he is best fitted; so that in this way each man is not a jack-of-all-trades, but all have their special work, young and old, women and children, bond and free, handicraftsmen, rulers and subjects. The first remark we make on this is, that Plato here places justice on a level with the other moments, and it thus appears as one of the four determinations. But he now retracts this statement and makes it justice which first gives to wisdom, courage and temperance the power to exist at all, and when they have once come into existence, the power to continue. This is the reason of his also saying that justice will be met with independently, if only the other virtues spoken of are forthcoming.[68] To express it more definitely, the Notion of justice is the foundation, the Idea of the whole, which falls into organic divisions, so that every part is only, as it were, a moment in the whole, and the whole exists through it. Thus the classes or qualities spoken of are nothing else than the moments of this whole. Justice is only the general and all-pervading quality; but at the same time it implies the independence of every part, to which the state gives liberty of action.

In the second place, it is clear from what he says, that Plato did not understand by justice the rights of property, the meaning which the term commonly bears in jurisprudence, but rather this, that the mind in its totality makes for itself a law as evidence of the existence of its freedom. In a highly abstract sense my personality, my altogether abstract freedom, is present in property. To explain what comes under this science of law, Plato considers on the whole superfluous (De Republica, IV. p. 425 Steph.; p. 176 Bekk.). To be sure we find him giving laws concerning property, police regulations, &c., "But," he says, "to impose laws about such matters on men of noble character does not repay the trouble." In truth, how can we expect to find divine laws in what contains contingencies alone? Even in the Laws he considers ethics chiefly, though he gives a certain amount of

attention to the rights of property. But as justice, according to Plato, is really the entire being, which presents itself to the individual in such a way that each man learns to do the work he is born to do as well as it can be done, and does it, it is only as determined individuality that man reaches what is law for him; only thus does he belong to the universal spirit of the state, coming in it to the universal of himself as a "this." While law is a universal with a definite content, and thus a formal universal only, the content in this case is the whole determined individuality, not this or that thing which is mine by the accident of possession; what I properly hold as my own is the perfected possession and use of my nature. To each particular determination justice gives its rights, and thus leads it back into the whole; in this way it is by the particularity of an individual being of necessity developed and brought into actuality, that each man is in his place and fulfils his vocation. Justice, therefore, according to its true conception, is in our eyes freedom in the subjective sense, because it is the attainment of actuality by the reason, and seeing that this right on the part of liberty to attain to actuality is universal, Plato sets up justice as the determination of the whole, indicating that rational freedom comes into existence through the organism of the state, — an existence which is then, as necessary, a mode of nature.

γ. The particular subject, as subject, has in the same way these qualities in himself; and these moments of the subject correspond with the three real moments of the state. That there is thus one rhythm, one type, in the Idea of the state, forms for Plato's state a great and grand basis. This third form, in which the above moments are exhibited, Plato characterizes in the following manner. There manifest themselves in the subject, first of all sundry wants and desires (ἐπιθυμίαι), like hunger and thirst, each of which has something definite as its one and only object. Work for the satisfaction of desires corresponds to the calling of the third class. But, secondly there is also at the same time to be found in the individual consciousness something

else which suspends and hinders the gratification of these desires, and has the mastery over the temptation thus to gratify them; this is reasonableness (λόγος). To this corresponds the class of rulers, the wisdom of the state. Besides these two ideas of the soul there is a third, anger (θυμός), which on one side is allied to the desires, but of which it is just as true that it resists the desires and takes the side of reason. "It may happen that a man has done wrong to another, and suffers hunger and cold at the hands of him whom he considers entitled to inflict them upon him; in this case, the nobler he is, the less will his anger be excited. But it may also happen that he suffers a wrong; if this is the case, he boils and chafes, and takes the side of what he believes to be justice, and endures hunger and cold and other hardships, and overcomes them, and will not desist from the right until he conquers or dies, or is calmed down by reason, as a shepherd quiets his dog." Anger corresponds with the class of the brave defenders in the state; as these grasp their weapons in behalf of reason within the state, so does anger take the part of reason, if it has not been perverted by an evil up-bringing. Therefore wisdom in the state is the same as in the individual, and this is true of courage also. For the rest, temperance is the harmony of the several moments of what pertains to nature; and justice, as in external matters it consists in each doing his own duty, so, in the inner life, it consists in each moment of the mind obtaining its right, and not interfering in the affairs of the others, but leaving them to do as they will.[69] We have thus the deduction of three moments, where the middle place between universality and particularity is filled by anger in its independence and as directed against the objective: it is the freedom which turns back within itself and acts negatively. Even here, where Plato has no consciousness of his abstract ideas, as he has in the Timæus, this of a truth is inwardly present to him, and everything is moulded thereby. This is given as the plan according to

which Plato draws up the great whole. To fill up the outlines is a mere detail, which in itself has no further interest.

b. In the second place Plato indicates the means of maintaining the state. As, speaking generally, the whole commonwealth rests on common morality as the minds of individuals grown into nature, this question is asked: How does Plato arrange that everyone takes as his own that form of activity for which he is specially marked out, and that it presents itself as the moral acting and willing of the individual, — that everyone, in harmony with temperance, submits to filling this his post? The main point is to train the individuals thereto. Plato would produce this ethical quality directly in the individuals, and first and foremost in the guardians, whose education is therefore the most important part of the whole, and constitutes the very foundation. For as it is to the guardians themselves that the care is committed of producing this ethical quality through maintenance of the laws, in these laws special attention must be given to the guardians' education; after that also to the education of the warriors. The condition of affairs in the industrial class causes the state but little anxiety, "for though cobblers should prove poor and worthless, and should be only in appearance what they ought to be, that is no great misfortune for the state."[70] The education of the presidents should, however, be carried on chiefly by means of philosophic science, which is the knowledge of the universal and absolute. Plato in this passes over the particular means of education, religion, art, science. Further on he speaks again and more in detail on the question of how far music and gymnastic are to be permitted as means. But the poets Homer and Hesiod he banishes from his state, because he thinks their representations of God unworthy.[71] For then began in real earnest an inquiry into the belief in Jupiter and the stories told by Homer, inasmuch as such particular representations had been taken as universal maxims and divine laws. At a certain stage of education childish tales do no harm; but

were they to be made the foundation of the truth of morality, as present law, the case would be different. The extermination of the nations which we read of in the writings of the Israelites, the Old Testament, might for instance be taken as a standard of national rights, or we might try to make a precedent of the numerous base acts committed by David, the man of God, or of the horrors which the priesthood, in the person of Samuel, practised and authorized against Saul. Then it would be high time to place these records on a lower level, as something past, something merely historical. Plato would further have preambles to the laws, wherein citizens would be admonished as to their duties, and convinced that these exist, &c.[72] They also should be shown how to choose that which is most excellent, in short, to choose morality.

But here we have a circle: the public life of the state subsists by means of morality, and, conversely, morality subsists by means of institutions. Morals cannot be independent of institutions, that is, institutions cannot be brought to bear on morals through educational establishments or religion only. For institutions must be looked on as the very first condition of morality, for this is the manner in which institutions are subjective. Plato himself gives us to understand how much contradiction he expects to find. And even now his defect is commonly considered to lie in his being too idealistic, while his real deficiency consists in his not being ideal enough. For if reason is the universal force, it is essentially spiritual; thus to the realm of the spiritual belongs subjective freedom, which had already been held up as a principle in the philosophy of Socrates. Therefore reason ought to be the basis of law, and so it is, on the whole. But, on the other hand, conscience, personal conviction, — in short, all the forms of subjective freedom — are essentially therein contained. This subjectivity at first, it is true, stands in opposition to the laws and reason of the state-organism as to the absolute power which desires to appropriate to itself — through the external

necessity of wants, in which, however, there is absolute reason — the individual of the family. Individual conscience proceeds from the subjectivity of free-will, connects itself with the whole, chooses a position for itself, and thus makes itself a moral fact. But this moment, this movement of the individual, this principle of subjective freedom, is sometimes ignored by Plato, and sometimes even intentionally disparaged, because it proved itself to be what had wrought the ruin of Greece; and he considers only how the state may best be organized, and not subjective individuality. In passing beyond the principle of Greek morality, which in its substantial liberty cannot brook the rise of subjective liberty, the Platonic philosophy at once grasps the above principle, and in so doing proceeds still farther.

c. In the third place, in regard to the exclusion of the principle of subjective freedom, this forms a chief feature in the Republic of Plato, the spirit of which really consists in the fact, that all aspects in which particularity as such has established its position, are dissolved in the universal, — all men simply rank as man in general.

α. It specially harmonizes with this particular quality of excluding the principle of subjectivity, that Plato in the first place does not allow individuals to choose their own class; this we demand as necessary to freedom. It is not, however, birth which marks off the different ranks, and determines individuals for these; but everyone is tested by the governors of the state, who are the elders of the first class, and have the education of individuals in their hands. According as anyone has natural ability and talents, these elders make choice and selection, and assign each man to a definite occupation.[73] This seems in direct contradiction to our principle, for although it is considered right that to a certain class there should belong a special capacity and skill, it always remains a matter of inclination which class one is to belong to; and with this inclination, as an apparently free choice, the class makes itself for itself. But it is not permitted that another individual should prescribe as to this, or say, for example: "Because you are not serviceable for anything better, you are to be a labourer." Everyone may make the experiment for himself; he must be allowed to decide regarding his own affairs as subject in a subjective manner, by his own free will, as well as in consideration of external circumstances; and nothing must therefore be put in his way if he says, for instance: "I should like to apply myself to study."

β. From this determination it further follows that Plato (De Republica, III. pp. 416, 417 Steph.; pp. 162-164 Bekk.) in like manner altogether abolished in his state the principle of private property. For in it individuality, the individual consciousness, becomes absolute; or the person is looked on as implicit, destitute of all content. In law, as such, I rank as "this" implicitly and explicitly. All rank thus, and I rank only because all rank, or I rank only as universal; but the content of this universality is fixed particularity. When in a question of law we have to do with law, as such, to the judges of the case it matters not a whit whether this or that man actually

possesses the house, and likewise the contending parties think nothing of the possession of the thing for which they strive, but of right for right's sake, (as in morality duty is done for duty's sake): thus a firm hold is kept of the abstraction, and from the content of reality abstraction is made. But Being to Philosophy is no abstraction, but the unity of the universal and reality, or its content. The content has therefore weight only in as far as it is negatively posited in the universal; thus only as returning into it, and not absolutely. In so far as I use things, — not in so far as I have them merely in my possession, or as they have worth for me as existent, as definitely fixed on me, — they stand in living relation to me. With Plato, then, those of the other class (cf. *supra*, p. 101, note) carry on handicrafts, trade, husbandry, and procure what will satisfy the general requirements, without acquiring personal property by means of their work, for they are all one family, wherein each has his appointed occupation; but the product of the work is common, and he receives as much as he requires both of his own and of the general product. Personal property is a possession which belongs to me as a certain person, and in which my person as such comes into existence, into reality; on this ground Plato excludes it. It remains, however, unexplained how in the development of industries, if there is no hope of acquiring private property, there can be any incentive to activity; for on my being a person of energy very much depends my capacity for holding property. That an end would be put to all strifes and dissensions and hatred and avarice by the abolition of private property, as Plato thinks, (De Republica, V. p. 464 Steph.; pp. 243, 244 Bekk.) may very well be imagined in a general way; but that is only a subordinate result in comparison with the higher and reasonable principle of the right of property: and liberty has actual existence only so far as property falls to the share of the person. In this way we see subjective freedom consciously removed by Plato himself from his state.

γ. For the same reason Plato also abolishes marriage, because it is a connection in which persons of opposite sex, as such, remain mutually bound to one another, even beyond the mere natural connection. Plato does not admit into his state family life — the particular arrangement whereby a family forms a whole by itself, — because the family is nothing but an extended personality, a relationship to others of an exclusive character within natural morality, — which certainly is morality, but morality of such a character as belongs to the individual as particularity. According to the conception of subjective freedom, however, the family is just as necessary, yea, sacred to the individual as is property. Plato, on the contrary, causes children to be taken away from their mothers immediately after birth, and has them gathered together in a special establishment, and reared by nurses taken from among the mothers who gave them birth; he has them brought up in common, so that no mother can possibly recognize her child. There are certainly to be marriage celebrations, and each man is to have his particular wife, but in such a way that the intercourse of man and wife does not pre-suppose a personal inclination, and that it should not be their own pleasure which marks out individuals for one another. The women should bear children from the twentieth to the fortieth year, the men should have wives from the thirtieth to the fifty-fifth year. To prevent incest, all the children born at the time of a man's marriage shall be known as his children.[74] The women, whose natural vocation is family life, are by this arrangement deprived of their sphere. In the Platonic Republic it therefore follows that as the family is broken up, and the women no longer manage the house, they are also no longer private persons, and adopt the manners of the man as the universal individual in the state. And Plato accordingly allows the women to take their part like the men in all manly labours, and even to share in the toils of war. Thus he places them on very nearly the same footing as the men, though all the same he has no great confidence in

their bravery, but stations them in the rear only, and not even as reserve, but only as *arrière-garde*, in order that they may at least inspire the foe with terror by their numbers, and, in case of necessity, hasten to give aid.[75]

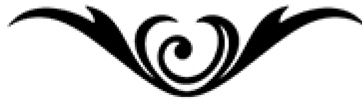
These are the main features of the Platonic Republic, which has as its essential the suppression of the principle of individuality; and it would appear as though the Idea demanded this, and as if this were the very point on which Philosophy is opposed to the ordinary way of looking at things, which gives importance to the individual, and thus in the state, as also in actualized mind, looks on the rights of property, and the protection of persons and their possessions, as the basis of everything that is. Therein, however, lies the very limit of the Platonic Idea — to emerge only as abstract idea. But, in fact, the true Idea is nothing else than this, that every moment should perfectly realize and embody itself, and make itself independent, while at the same time, in its independence, it is for mind a thing sublated. In conformity with this Idea, individuality must fully realize itself, must have its sphere and domain in the state, and yet be resolved in it. The element of the state is the family, that is, the family is the natural unreasoning state; this element must, as such, be present. Then the Idea of the state constituted by reason has to realize all the moments of its Notion in such a way that they become classes, and the moral substance divides itself into portions, as the bodily substance is separated into intestines and organs, each of which lives on in a particular way of its own, yet all of which together form only one life. The state in general, the whole, must finally pervade all. But in exactly the same way the formal principle of justice, as abstract universality of personality with individual Being as its existent content, must pervade the whole; one class, nevertheless, specially belongs to it. There must, then, also be a class in which property is held immediately and permanently, the possession of the body and the possession of a piece of land alike; and in the next place, a class where acquisition is continually

going on, and possession is not immediate, as in the other, but property is ever fluctuating and changing. These two classes the nation gives up as a part of itself to the principle of individuality, and allows rights to reign here, permitting the constant, the universal, the implicit to be sought in this principle, which really is a principle of variability. This principle must have its full and complete reality, it must indeed appear in the shape of property. We have here for the first time the true, actual mind, with each moment receiving its complete independence, and the mind itself attaining to being-another in perfect indifference of Being. Nature cannot effect this production of independent life in her parts, except in the great system.[76] This is, as we shall elsewhere see, the great advance of the modern world beyond the ancient, that in it the objective attains to greater, yea, to absolute independence, but for the very same reason returns with all the greater difficulty into the unity of the Idea.

The want of subjectivity is really the want of the Greek moral idea. The principle which became prominent with Socrates had been present up to this time only in a more subordinate capacity; now it of necessity became an even absolute principle, a necessary moment in the Idea itself. By the exclusion of private property and of family life, by the suspension of freedom in the choice of the class, *i.e.* by the exclusion of all the determinations which relate to the principle of subjective freedom, Plato believes he has barred the doors to all the passions; he knew very well that the ruin of Greek life proceeded from this, that individuals, as such, began to assert their aims, inclinations, and interests, and made them dominate over the common mind. But since this principle is necessary through the Christian religion — in which the soul of the individual is an absolute end, and thus has entered into the world as necessary in the Notion of the mind — it is seen that the Platonic state-constitution cannot fulfil what the higher demands of a moral organism require. Plato has not recognized the

knowledge, wishes, and resolutions of the individual, nor his self-reliance, and has not succeeded in combining them with his Idea; but justice demands its rights for this just as much as it requires the higher resolution of the same, and its harmony with the universal. The opposite to Plato's principle is the principle of the conscious free will of individuals, which in later times was by Rousseau more especially raised to prominence: the theory that the arbitrary choice of the individual, the outward expression of the individual, is necessary. In this the principle is carried to the very opposite extreme, and has emerged in its utter one-sidedness. In opposition to this arbitrariness and culture there must be the implicitly and explicitly universal, that which is in thought, not as wise governor or morality, but as law, and at the same time as my Being and my thought, *i.e.* as subjectivity and individuality. Men must have brought forth from themselves the rational along with their interests and their passions, just as it must enter into reality through the necessities, opportunities, and motives that impel them.

There is still another celebrated side of the Platonic philosophy which may be considered, namely æsthetics, the knowledge of the beautiful. In respect to this, Plato has in like manner seized the one true thought, that the essence of the beautiful is intellectual, the Idea of reason. When he speaks of a spiritual beauty, he is to be understood in the sense that beauty, as beauty, is sensuous beauty, which is not in some other place — no one knows where; but what is beautiful to the senses is really the spiritual. The case is the same here as it is with his Idea. As the essence and truth of phenomena in general is the Idea, the truth of phenomenal beauty must also be this Idea. The relation to the corporeal, as a relation of the desires, or of pleasure and utility, is no relation to it as the beautiful; it is a relation to it as the sensuous alone, or a relation of particular to particular. But the essence of the beautiful is just the simple Idea of reason present to the sensuous



apprehension as a thing; the content of the thing is nothing else than this.[77] The beautiful is essentially of spiritual nature; it is thus not merely a sensuous thing, but reality subject to the form of universality, to the truth. This universal does not, however, retain the form of universality, but the universal is the content whose form is the sensuous mode; and therein lies the determination of the beautiful. In science, the universal has again the form of the universal or of the Notion; but the beautiful appears as an actual thing — or, when put into words, as a popular conception, in which mode the material exists in mind. The nature, essence, and content of the beautiful is recognized and judged by reason alone, as its content is the same as that of Philosophy. But because reason appears in the beautiful in material guise, the beautiful ranks below knowledge, and Plato has for this very reason placed the true manifestation of reason in knowledge, where it is spiritually manifested.

This may be regarded as the kernel of Plato's philosophy. His standpoint is: first, the contingent form of speech, in which men of noble and unfettered nature converse without other interest than that of the theory which is being worked out; secondly, led on by the content, they reach the deepest Notions and the finest thoughts, like jewels on which one stumbles, if not exactly in a sandy desert, yet at least upon the arid path; in the third place, no systematic connection is to be found, though one interest is the source of all; in the fourth place, the subjectivity of the Notion is lacking throughout; but in the fifth place, the substantial Idea forms the principle.

Plato's philosophy had two stages through which it of necessity developed and worked its way up to a higher principle. The universal which is in reason had first to fall into two divisions opposed to each other in the most direct and unmitigated contradiction, in the independence of the personal consciousness which exists for itself: thus in the New Academy self-consciousness goes back into itself, and becomes a species of

scepticism — the negative reason, which turns against all that is universal, and fails to find the unity of self-consciousness and the universal, coming accordingly to a standstill at that point. But, in the second place, the Neo-Platonists constitute the return, this unity of self-consciousness and the absolute essence; to them God is directly present in reason, reasoned knowledge itself is the Divine Spirit, and the content of this knowledge is the Being of God. Both of these we shall consider later.

B. Aristotle.

HERE WE LEAVE Plato, and we do so with regret. But seeing that we pass to his disciple, Aristotle, we fear that it behoves us to enter even more into detail, since he was one of the richest and deepest of all the scientific geniuses that have as yet appeared — a man whose like no later age has ever yet produced. Because we still possess so large a number of his works, the extent of the material at hand is proportionately greater; unfortunately, however, I cannot give to Aristotle the amount of attention that he deserves. For we shall have to confine ourselves to a general view of his philosophy, and simply remark on one particular phase of it, viz. in how far Aristotle in his philosophy carried out what in the Platonic principle had been begun, both in reference to the profundity of the ideas there contained, and to their expansion; no one is more comprehensive and speculative than he, although his methods are not systematic.

As regards the general character of Aristotle's writings, he may be said to have extended his attention to the whole circle of human conceptions, to have penetrated all regions of the actual universal, and to have brought under the subjection of the Notion both their riches and their diversitude. For most of the philosophic sciences have to render thanks to him both for their characterization and first commencement. But although in this way Science throughout falls into a succession of intellectual determinations of determinate Notions, the Aristotelian philosophy still contains the profoundest speculative Notions. Aristotle proceeds in reference to the whole in the same way as in the individual case. But a general view of his philosophy does not give us the impression of its being in construction a self-systematized whole, of which the order and connection pertain likewise

to the Notion; for the parts are empirically selected and placed together in such a way that each part is independently recognized as a determinate conception, without being taken into the connecting movement of the science. We need not try to demonstrate necessity from the standpoint of the philosophy of that time. But although Aristotle's system does not appear to be developed in its parts from the Notion, and its parts are merely ranged side by side, they still form a totality of truly speculative philosophy.

One reason for treating of Aristotle in detail rests in the fact that no philosopher has had so much wrong done him by the thoughtless traditions which have been received respecting his philosophy, and which are still the order of the day, although for centuries he was the instructor of all philosophers. For to him views are ascribed diametrically opposite to his philosophy. And while Plato is much read, the treasures contained in Aristotle have for centuries, and until quite modern times, been as good as unknown, and the falsest prejudices reign respecting him. Almost no one knows his speculative and logical works; in modern times more justice has been done to his writings regarding nature, but not to his philosophic views. For instance, there is a quite generally held opinion that the Aristotelian and Platonic philosophies are directly opposed, the one being idealistic and the other realistic, and that, indeed, in the most trivial sense. For Plato is said to have made the ideal his principle, so that the inward idea creates from itself; according to Aristotle, on the contrary, we are told that the soul is made a *tabula rasa*, receiving all its determinations quite passively from the outer world; and his philosophy is thus mere empiricism — Locke's philosophy at its worst. But we shall see how little this really is the case. In fact Aristotle excels Plato in speculative depth, for he was acquainted with the deepest kind of speculation — idealism — and in this upholds the most extreme empirical development. Quite false views respecting Aristotle even now exist in France. An example of how tradition blindly echoes opinions

respecting him, without having observed from his works whether they are justified or not, is the fact that in the old Æsthetics the three unities of the drama — action, time and place — were held to be *règles d'Aristote, la saine doctrine*. But Aristotle speaks (Poet. c. 8 et 5)[78] only of the unity of treatment, or very occasionally of the unity of time; of the third unity, that of place, he says nothing.

As regards Aristotle's life, he was born at Stagira, a Thracian town on the Strymonian Gulf, but a Greek colony. Thus, though a Thracian, he was by birth a Greek. This Greek colony fell, however, like The rest of the country, under the rule of Philip of Macedon. The year of Aristotle's birth is the first of the 99th Olympiad (384 B.C.), and if Plato was born in the third year of the 87th Olympiad (430 B.C.), Aristotle must have been forty-six years younger than he. His father Nicomachus was physician to the Macedonian king, Amyntas, the father of Philip. After the death of his parents, whom he lost early, he was brought up by a certain Proxenus, to whom he was ever grateful; and during all his life he held the memory of this friend in such high esteem, that he honoured it by erecting statues to him. He also requited Proxenus for the education given him, by later on bringing up his son Nicanor, adopting him as his own son and making him his heir. In the seventeenth year of his age Aristotle came to Athens, and remained there twenty years in company with Plato.[79] He thus had the best possible opportunity of becoming thoroughly acquainted with Plato's philosophy, and therefore, if we are told that he did not understand it (Vol. I p. 167), this is shown, by the evident facts of the case, to be an arbitrary and quite unfounded assumption. As regards the relation of Plato to Aristotle, and particularly as regards the fact that Plato did not select Aristotle as his successor in the Academy, but chose Speusippus, a near relative, instead, a number of idle and contradictory anecdotes have come to us from Diogenes (V. 2). If the continuation of the Platonic school was designed to express the

hope that the philosophy of Plato, as comprehended by himself, was to be there satisfactorily maintained, Plato could certainly not designate Aristotle as his successor, and Speusippus was the right man to be selected. However, Plato had nevertheless Aristotle as his successor, for Aristotle understood Philosophy in Plato's sense, though his philosophy was deeper and more worked out, and thus he carried it further. Displeasure at being thus passed over is said to have been the cause of Aristotle's leaving Athens after Plato's death, and living for three years with Hermias, the Tyrant of Atarneus in Mysia, who had been a disciple of Plato along with Aristotle, and who had then struck up a close friendship with the latter. Hermias, an independent prince, was, together with other absolute Greek princes and some Republics, brought under the subjection of a Persian satrap in Asia Minor. Hermias was even sent as prisoner to Artaxerxes in Persia, and he at once caused him to be crucified. In order to avoid a similar fate, Aristotle fled with his wife Pythias, the daughter of Hermias, to Mitylene, and lived there for some time. He, however, erected a statue to Hermias in Delphi, with an inscription which has been preserved. From it we know that it was by cunning and treachery that he came under the power of the Persians. Aristotle also honoured his name in a beautiful hymn on Virtue, which has likewise come down to us.[80]

From Mitylene he was (Ol. 109, 2; 343 B.C.) summoned by Philip of Macedon to undertake the education of Alexander, who was then fifteen years old. Philip had already invited him to do this in the well-known letter that he addressed to him just after Alexander's birth: "Know that a son is born to me, but I thank the gods less that they have given him to me, than that they have caused him to be born in your time. For I hope that your care and your wisdom will make him worthy of me and of his future kingdom."[81] It certainly would appear to be a brilliant historic destiny to be the instructor of an Alexander, and Aristotle at this court enjoyed the favour and esteem

of Philip and of Olympias in the highest degree. What became of Aristotle's pupil is known to all, and the greatness of Alexander's mind and deeds, as also his enduring friendship, are the best witnesses of the success, as also of the spirit of this up-bringing, if Aristotle required such testimony. Alexander's education utterly refuted the common talk about the practical uselessness of speculative philosophy. Aristotle had in Alexander another and worthier pupil than Plato found in Dionysius. Plato's great interest was his Republic, the ideal of a state; he enters into relation with a person through whom it might be carried out; the individual was thus to him a medium only, and in so far indifferent to him. With Aristotle, on the other hand, this purpose was not present, he merely had the simple individual before him; and his end was to bring up and to develop the individuality as such. Aristotle is known to be a profound, thorough, and abstract metaphysician, and it is evident that he meant seriously with Alexander. That Aristotle did not follow with Alexander the ordinary superficial method of educating princes, might be confidently expected from the earnestness of one who well knew what was truth and true culture. It is also evident from the circumstance that Alexander, while in the midst of his conquests in the heart of Asia, when he heard that Aristotle had made known his acroamatic doctrines in speculative (metaphysical) writings, wrote him a reproachful letter, in which he said that he should not have made known to the common people what the two had worked out together. To this Aristotle replied that, though published, they were really just as much unpublished as before.[82]

This is not the place to estimate Alexander as an historic personage. What can be ascribed in Alexander's education to Aristotle's philosophic instruction is the fact that what was natural to him, the inherent greatness of his mental disposition, acquired inward freedom also, and became elevated into the perfect, self-conscious independence which we see in his aims and

deeds. Alexander attained to that perfect certainty of himself which the infinite boldness of thought alone gives, and to an independence of particular and limited projects, as also to their elevation into the entirely universal end of bringing about in the world a social life and intercourse of a mutual kind, through the foundation of states which were free from contingent individuality. Alexander thus carried out the plan which his father had already conceived, which was, at the head of the Greeks, to avenge Europe upon Asia, and to subject Asia to Greece; so that as it was in the beginning of Greek history that the Greeks were united, and that only for the Trojan war, this union likewise brought the Greek world proper to an end. Alexander thereby also avenged the faithlessness and cruelty perpetrated by the Persians on Aristotle's friend Hermias. But Alexander further disseminated Greek culture over Asia, in order to elevate into a Greek world this wild medley of utter barbarism, bent solely on destruction, and torn by internal dissensions, these lands entirely sunk in indolence, negation, and spiritual degeneracy. And if it be said that he was merely a conqueror who was unable to establish an enduring kingdom, because his kingdom at his death once more fell to pieces, we must acknowledge that, from a superficial view of the case, this is true, as his family did not retain their rule; Greek rule was, however, maintained. Thus Alexander did not found an extensive kingdom for his family, but he founded a kingdom of the Greek nation over Asia; for Greek culture and science have since his time taken root there. The Greek kingdoms of Asia Minor, and particularly of Egypt, were for centuries the home of science; and their influence may have extended as far as to India and to China. We certainly do not know definitely whether the Indians may not have obtained what is best in their sciences in this way, but it is probable that at least the more exact portion of Indian astronomy came to them from Greece. For it was from the Syrian kingdom, stretching into Asia Minor as far as to a Greek kingdom in

Bactria, that there was doubtless conveyed to the interior of India and China, by means of Greek colonies migrating thither, the meagre scientific knowledge which has lingered there like a tradition, though it has never flourished. For the Chinese, for example, are not skilful enough to make a calendar of their own, or to think for themselves. Yet they exhibited ancient instruments unsuited to any work done by them, and the immediate conjecture was that these had come from Bactria. The high idea that men had of the sciences of the Indians and of the Chinese hence is false.

According to Ritter (Erdkunde, Vol. II. p. 839, of the first edition), Alexander did not set out merely with a view of conquering, but with the idea that he was the Lord. I do not think that Aristotle placed this notion, which was connected with another Oriental conception, in the mind of Alexander. The other idea is that in the East the name of Alexander still flourishes as Ispander, and as Dul-k-ar-nein, *i.e.* the man with two horns, just as Jupiter Ammon is an ancient Eastern hero. The question would now be whether the Macedonian kings did not, through their descent from the ancient race of Indian heroes, claim to rule this land; by this the progress of Dionysius from Thrace to India could likewise be explained; whether the "knowledge of this was not the real and fundamental religious idea inspiring the young hero's soul when, before his journey to Asia, he found on the lower Ister (Danube) Indian priestly states where the immortality of the soul was taught, and when, certainly not without the counsel of Aristotle, who, through Plato and Pythagoras, was initiated into Indian wisdom, he began the march into the East, and first of all visited the Oracle of Ammonium (now Siwah), and then destroyed the Persian kingdom and burnt Persepolis, the old enemy of Indian religion, in order to take revenge upon it for all the violence exercised through Darius on the Buddhists and their co-religionists." This is an ingenious theory, formed from a thorough investigation of the connection which exists between Oriental and European

ideas from the higher point of view in history. But, in the first place, this conjecture is contrary to the historical basis on which I take my stand. Alexander's expedition has quite another historic, military, and political character than this, and had not much to do with his going to India; it was, on the face of it, an ordinary conquest. In the second place, Aristotle's metaphysic and philosophy is far from recognizing any such foolish and extravagant imaginations. The elevation of Alexander in the Oriental mind into an acknowledged hero and god, which followed later, is, in the third place, not matter for surprise; the Dalai-Lama is still thus honoured, and God and man are never so very far asunder. Greece likewise worked its way to the idea of a God becoming man, and that not as a remote and foreign image, but as a present God in a godless world: Demetrius Phalereus and others were thus soon after honoured and worshipped in Athens as God. Was the infinite not also now transplanted into self-consciousness? Fourthly, the Buddhists did not interest Alexander, and in his Indian expedition they do not appear; the destruction of Persepolis is, however, sufficiently justified as a measure of Greek vengeance for the destruction by Xerxes of the temples in Greece, especially in Athens.

While Alexander accomplished this great work — for he was the greatest individual at the head of Greece, he ever kept science and art in mind. Just as in modern times we have once more met with warriors who thought of science and of art in their campaigns, we also find that Alexander made an arrangement whereby whatever was discovered in the way of animals and plants in Asia should be sent to Aristotle, or else drawings and descriptions of the same. This consideration on Alexander's part afforded to Aristotle a most favourable opportunity of collecting treasures for his study of nature. Pliny (Histor. natur. VIII., 17 ed. Bip.) relates that Alexander directed about a thousand men, who lived by hunting, fishing and fowling, the overseers of the zoological gardens, aviaries, and tanks of the Persian kingdom, to

supply Aristotle with what was remarkable from every place. In this way Alexander's campaign in Asia had the further effect of enabling Aristotle to found the science of natural history, and to be the author, according to Pliny, of a natural history in fifty parts.

After Alexander commenced his journey to Asia, Aristotle returned to Athens, and made his appearance as a public teacher in the Lyceum, a pleasure-ground which Pericles had made for the exercising of recruits; it consisted of a temple dedicated to Apollo (Λύκειος), and shady walks (περίπατοι), which were enlivened by trees, fountains and colonnades. It was from these walks that his school received the name of Peripatetics, and not from any walking about on the part of Aristotle — because, it is said, he delivered his discourses usually while walking. He lived and taught in Athens for thirteen years. But after the death of Alexander there broke out a tempest which had, as it appeared, been long held back through fear of Alexander; Aristotle was accused of impiety. The facts are differently stated: amongst other things it is said that his hymn to Hermias and the inscription on the statue dedicated to him were laid to his charge. When he saw the storm gathering, he escaped to Chalcis in Eub\na, the present Negropont, in order, as he himself said, that the Athenians should not have an opportunity of once more sinning against Philosophy. There he died, in the next year, in the sixty-third year of his age, Ol. 114, 3 (322 B.C.).[83]

We derive Aristotle's philosophy from his writings; but when we consider their history and nature, so far as externals are concerned, the difficulty of deriving a knowledge of his philosophy from them seems much increased. I cannot certainly enter into details regarding these last. Diogenes Laërtius (V. 21-27) mentions a very large number of them, but by their titles we do not always quite know which of those now in our possession are indicated, since the titles are entirely different. Diogenes gives the number of lines as four hundred and forty-five thousand, two hundred and seventy,

and, if we count about ten thousand lines in a printer's alphabet, this gives us forty-four alphabets. What we now have might perhaps amount to about ten alphabets, so that we have only about the fourth part left to us. The history of the Aristotelian manuscripts has been stated to be such that it would really seem impossible, or almost hopeless, that any one of his writings should have been preserved to us in its original condition, and not corrupted. Doubts regarding their genuine character could not in such circumstances fail to exist; and we can only wonder at seeing them come down to us even in the condition in which they are. For, as we have said, Aristotle made them known but little during his lifetime, and he left his writings to Theophrastus, his successor, with the rest of his immense library. This, indeed, is the first considerable library, collected as it was by means of personal wealth along with Alexander's assistance, and hence it also reveals to us Aristotle's learning. Later on, it came partially, or in some cases in duplicate, to Alexandria, and formed the basis of the Ptolemaic library, which, on the taking of Alexandria by Julius Cæsar, became a prey to fire. But of the manuscripts of Aristotle himself it is said that Theophrastus left them by will to a certain Neleus, from whom they came into the hands of ignorant men, who either kept them without care or estimation of their value, or else the heirs of Neleus, in order to save them from the Kings of Pergamus, who were very anxious to collect a library, hid them in a cellar, where they lay forgotten for a hundred and thirty years, and thus got into bad condition. Finally, the descendants of Theophrastus found them again after long search, and sold them to Apellicon of Teos, who restored what had been destroyed by worms and mould, but who did not possess the learning or the capacity so to do. Hence others went over them, filled up the blanks as they thought best, replaced what was damaged, and thus they were sufficiently altered. But still it was not enough. Just after Apellicon's death, the Roman Sulla conquered Athens, and amongst the spoil carried off

to Rome were the works of Aristotle. The Romans, who had just begun to become acquainted with Greek science and art, but who did not yet appreciate Greek philosophy, did not know how to profit from this spoil. A Greek, named Tyrannion, later on obtained permission to make use of and publish the manuscripts of Aristotle, and he prepared an edition of them, which, however, also bears the reproach of being inaccurate, for here they had the fate of being given by the dealers into the hands of ignorant copyists, who introduced a number of additional corruptions.[84]

This is the way in which the Aristotelian philosophy has come to us. Aristotle certainly made known much to his contemporaries, that is to say, the writings in the Alexandrian library, but even those works do not seem to have been widely known. In fact, many of them are most corrupt, imperfect, and, as, for example, the Poetics, incomplete. Several of them, such as the Metaphysical treatises, seem to be patched up from different writings, so that the higher criticism can give rein to all its ingenuity, and, according to one clever critic, the matter may with much show of probability be decided in one particular way, while another ingenious person has a different explanation to oppose to this.[85] So much remains certain, that the writings of Aristotle are corrupt, and often both in their details and in the main, not consistent; and we often find whole paragraphs almost verbally repeated. Since the evil is so old, no real cure can certainly be looked for; however, the matter is not so bad as would appear from this description. There are many and important works which may be considered to be entire and uninjured, and though there are others corrupt here and there, or not well arranged, yet, as far as the essentials are concerned, no such great harm has been done as might appear. What we possess therefore places us in a sufficiently good position to form a definite idea of the Aristotelian philosophy, both as a whole, and in many of its details.

But there is still an historic distinction to be noted. For there is an old tradition that Aristotle's teaching was of a twofold nature and that his writings were of two different kinds, viz. esoteric or acroamatic and exoteric — a distinction which was also made by the Pythagoreans (Vol. I. p 202). The esoteric teaching was given within the Lyceum in the morning, the exoteric in the evening; the latter related to practice in the art of rhetoric and in disputation, as also to civic business, but the other to the inward and more profound philosophy, to the contemplation of nature and to dialectic proper.[86] This circumstance is of no importance; we see by ourselves which of his works are really speculative and philosophic, and which are rather empirical in character; but they are not to be regarded as antagonistic in their content, and as if Aristotle intended some for the people and others for his more intimate disciples.

a. We have first to remark that the name Aristotelian philosophy is most ambiguous, because what is called Aristotelian philosophy has at different times taken very different forms. It first of all signifies Aristotelian philosophy proper. As regards the other forms of the Aristotelian philosophy, however, it had, in the second place, at the time of Cicero, and specially under the name of Peripatetic philosophy, more of the form of a popular philosophy, in which attention was principally directed to natural history and to morals (Vol. I. p. 479). This period does not appear to have taken any interest in working out and bringing to consciousness the deep and properly speaking speculative side of Aristotelian philosophy, and indeed with Cicero there is no notion of it present. A third form of this philosophy is the highly speculative form of the Alexandrine philosophy, which is also called the Neo-Pythagorean or Neo-Platonic philosophy, but which may just as well be called Neo-Aristotelian — the form as it is regarded and worked up by the Alexandrines, as being identical with the Platonic. An important signification of the expression, in the fourth place, is

that which it had in the middle ages where, through insufficient knowledge, the scholastic philosophy was designated Aristotelian. The Scholastics occupied themselves much with it, but the form that the philosophy of Aristotle took with them cannot be held by us to be the true form. All their achievements, and the whole extent of the metaphysics of the understanding and formal logic which we discover in them, do not belong to Aristotle at all. Scholasticism is derived only from traditions of the Aristotelian doctrines. And it was not until the writings of Aristotle became better known in the West, that a fifth Aristotelian philosophy was formed, which was in part opposed to the Scholastic — it arose on the decline of scholasticism and with the revival of the sciences. For it was only after the Reformation that men went back to the fountainhead, to Aristotle himself. The sixth signification which Aristotelian philosophy bears, is found in false modern ideas and conceptions, such as those that we find in Tennemann, who is gifted with too little philosophic understanding to be able to grasp the Aristotelian philosophy (Vol. I. p. 113). Indeed, the general opinion of Aristotelian philosophy now held is that it made what is called experience the principle of knowledge.

b. However false this point of view on the one hand is, the occasion for it may be found in the Aristotelian manner. Some particular passages to which in this reference great importance has been given, and which have been almost the only passages understood, are made use of to prove this idea. Hence we have now to speak of the character of the Aristotelian manner. Since in Aristotle, as we already said (p. 118), we need not seek a system of philosophy the particular parts of which have been deduced, but since he seems to take an external point of departure and to advance empirically, his manner is often that of ordinary ratiocination. But because in so doing Aristotle has a quality, altogether his own, of being throughout intensely speculative in his manner, it is further signified that in the first place he has

comprehended the phenomenal as a thinking observer. He has the world of appearance before himself complete and in entirety, and sets nothing aside, however common it may appear. All sides of knowledge have entered into his mind, all have interest for him, and he has thoroughly dealt with all. In the empirical details of a phenomenon abstraction may easily be lost sight of, and its application may be difficult: our progress may be one-sided, and we may not be able to reach the root of the matter at all. But Aristotle, because he looks at all sides of the universe, takes up all those units as a speculative philosopher, and so works upon them that the profoundest speculative Notion proceeds therefrom. We saw, moreover, thought first proceeding from the sensuous, and, in Sophistry, still exercising itself immediately in the phenomenal. In perception, in ordinary conception, the categories appear: the absolute essence, the speculative view of these elements, is always expressed in expressing perceptions. This pure essence in perception Aristotle takes up. When, in the second place, he begins conversely with the universal or the simple, and passes to its determination, this looks as if he were enumerating the number of significations in which it appears; and, after dealing with them all, he again passes all their forms in review, even the quite ordinary and sensuous. He thus speaks of the many significations that we find, for example, is the words οὐσία, ἀρχή, αἰτία, ὁμοῦ, &c. It is in some measure wearisome to follow him in this mere enumeration, which proceeds without any necessity being present, and in which the significations, of which a list is given, manifest themselves as comprehended only in their essence, or in that which is common to all, and not in their determinations; and thus the comprehension is only external. But, on the one hand, this mode presents a complete series of the moments, and on the other, it arouses personal investigation for the discovery of necessity. In the third place, Aristotle takes up the different thoughts which earlier philosophers have had, contradicts them — often empirically —

justifies them, reasoning in all sorts of ways, and then attains to the truly speculative point of view. And finally, in the fourth place, Aristotle passes on thoughtfully to consider the object itself of which he treats, *e.g.* the soul, feeling, recollection, thought, motion, time, place, warmth, cold, &c. Because he takes all the moments that are contained within the conception to be, so to speak, united, he does not omit determinations; he does not hold now to one determination and then to another, but takes them as all in one; while reflection of the understanding, which has identity as the rule by which it goes, can only preserve harmony with this by always, while in one determination, forgetting and withholding the other. But Aristotle has the patience to go through all conceptions and questions, and from the investigation of the individual determinations, we have the fixed, and once more restored determination of every object. Aristotle thus forms the Notion, and is in the highest degree really philosophic, while he appears to be only empiric. For Aristotle's empiricism is a totality because he always leads it back again immediately to speculation; he may thus be said to be a perfect empiricist, yet at the same time a thinking one. If, for example, we take away from space all its empirical determinations, the result will be in the highest degree speculative, for the empirical, comprehended in its synthesis, is the speculative Notion.

In this gathering up of determinations into one Notion, Aristotle is great and masterly, as he also is in regard to the simplicity of his method of progression, and in the giving of his decisions in few words. This is a method of treating of Philosophy which has great efficacy, and which in our time has likewise been applied, *e.g.* by the French. It deserves to come into larger use, for it is a good thing to lead the determinations of the ordinary conception from an object to thought, and then to unite them in a unity, in the Notion. But undoubtedly this method in one respect appears to be empirical, and that, indeed, in the acceptation of objects as we know them

in our consciousness; for if no necessity is present, this still more appears merely to pertain to manner externally regarded. And yet it cannot be denied that with Aristotle the object was not to bring everything to a unity, or to reduce determinations to a unity of opposites, but, on the contrary, to retain each in its determination and thus to follow it up. That may, on the one hand, be a superficial method, *e.g.* when everything is brought to an empty determinateness, such as those of irritability and sensibility, sthenic and asthenic, but, on the other, it is likewise necessary to grasp reality in simple determinateness, though without making the latter in this superficial way the starting point. Aristotle, on the other hand, simply forsakes determination in another sphere where it no longer has this form; but he shows what it is like here, or what change has taken place within it, and thus it comes to pass that he often treats one determination after the other without showing their connection. However, in his genuine speculation Aristotle is as profound as Plato, and at the same time more developed and explicit, for with him the opposites receive a higher determination. Certainly we miss in him the beauty of Plato's form, the melodious speech, or, as we might almost call it, chatting — the conversational tone adopted, which is as lively as it is cultured and human. But where in Plato we find, as we do in his Timæus, the speculative Idea definitely expressed in the thesis form, we see in it a lack both of comprehension and purity; the pure element escapes it, while Aristotle's form of expression is marked both by purity and intelligibility. We learn to know the object in its determination and its determinate Notion; but Aristotle presses further into the speculative nature of the object, though in such a way that the latter remains in its concrete determination, and Aristotle seldom leads it back to abstract thought-determinations. The study of Aristotle is hence inexhaustible, but to give an account of him is difficult, because his teaching must be reduced to universal principles. Thus in order to set forth Aristotelian philosophy, the

particular content of each thing would have to be specified. But if we would be serious with Philosophy, nothing would be more desirable than to lecture upon Aristotle, for he is of all the ancients the most deserving of study.

c. What ought to come next is the determination of the Aristotelian Idea, and here we have to say, in quite a general way, that Aristotle commences with Philosophy generally, and says, in the first place, regarding the value of Philosophy (in the second chapter of the first book of the Metaphysics), that the object of Philosophy is what is most knowable, viz. the first and original causes, that is, the rational. For through these and from these all else is known, but principles do not become known through the facts which form their groundwork (ὑποκείμενα). In this we already have the opposite to the ordinary point of view. Aristotle has further declared the chief subject of investigation, or the most essential knowledge (ἐπιστήμη ἀρχικωτάτη) to be the knowledge of end; but this is the good in each thing and, generally speaking, the best in the whole of nature. This also holds good with Plato and Socrates; yet the end is the true, the concrete, as against the abstract Platonic Idea. Aristotle then says of the value of Philosophy, "Men have begun to philosophize through wonder," for in it the knowledge of something higher is at least anticipated. "Thus since man, to escape from ignorance, began to philosophize, it is clear that for the sake of knowledge he followed after knowledge, and not for any utility which it might possess for him. This is also made evident by the whole course of its external history. For it was after men had done with all their absolute requirements, and with what concerns their comfort, that they first began to seek this philosophic knowledge. We hence seek it not for the sake of any outside utility that it may have. And thus as we say that a free man is he who exists on his own account and not for another, Philosophy is the only science that is free, because it alone exists for itself — it is knowledge on account of knowledge. Therefore in justice it will not be held to be a human

possession," in the sense that, as we said above, (p. 11) it is not in the possession of a man. "For in many ways the nature of man is dependent, so that, according to Simonides, God alone possesses the prerogative (γέρας), and yet it is unworthy on man's part not to seek after the science that is in conformity with his own condition (τὴν καθ' αὑτὸν ἐπιστήνην). But if the poets were right, and envy characterized divinity, all who would aim higher must be unfortunate;" Nemesis punishes whatever raises itself above the commonplace, and makes everything again equal. "But the divine cannot be jealous," *i.e.* cannot refuse to impart that which it is, as if this knowledge should not come to man (*supra*, pp. 72, 73) "and — according to the proverb — the poets utter many falsehoods. Nor ought we to consider that any science is more entitled to honour than the one we now investigate, for that which is most divine, is also most worthy of honour." That is to say, what has and imparts what is best is honoured: the gods are thus to be honoured because they have this knowledge. "God is held to be the cause and principle of everything, and therefore God has this science alone, or for the most part." But for this reason it is not unworthy of man to endeavour to seek the highest good which is in conformity with him, this knowledge pertaining to God. "All other sciences are, however, more requisite than Philosophy, but none more excellent."

It is difficult to give a more detailed account of the Aristotelian philosophy, the universal Idea with the more important elements, for Aristotle is much more difficult to comprehend than Plato. In the latter there are myths, and we can pass over the dialectic and yet say that we have read Plato; but with Aristotle we enter at once upon what is speculative. Aristotle always seems to have philosophized only respecting the individual and particular, and not to have risen from it to the thought of the absolute and universal, to the thought of God; he always goes from the individual to the individual. His task concerns what is, and is just as clearly divided off as a

professor has his work divided into a half year's course; and though in this course he examines the whole of the world of conception, he yet appears only to have recognized the truth in the particular, or only a succession of particular truths. This has nothing dazzling about it, for he does not appear to have risen to the Idea (as Plato speaks of the nobility of Idea), nor to have led back to it the individual. But if Aristotle on the one hand did not logically abstract the universal Idea, (for then his so-called logic, which is something very different, would have had as its principle the recognition of one Notion in all) on the other hand there appears in Aristotle the one Absolute, the idea of God, as itself a particular, in its place beside the others, although it is all Truth. It is as if we said, "there are plants, animals, men, and also God, the most excellent of all."

From the whole list of conceptions which Aristotle enumerates, we shall now select some for further examination, and I will first speak of his metaphysics and its determinations. Then I will deal with the particular sciences which have been treated by Aristotle, beginning by giving the fundamental conception of nature as it is constituted with Aristotle; in the third place I will say something of mind, of the soul and its conditions, and finally the logical books of Aristotle will follow.

1. The Metaphysics.

Aristotle's speculative Idea is chiefly to be gathered from his Metaphysics, especially from the last chapters of the twelfth book (Λ) which deal with the divine Thought. But this treatise has the peculiar drawback noticed above (p. 128) of being a compilation, several treatises having been combined into one. Aristotle and the ancients did not know this work by the name of the Metaphysics; it was by them called πρώτη φιλοσοφία.[87] The main portion of this treatise has a certain appearance of unity given to it by the connection of the argument,[88] but it cannot be said that the style is orderly and lucid.

This pure philosophy Aristotle very clearly distinguishes (Metaph. IV. 1) from the other sciences as “the science of that which is, in so far as it is, and of what belongs to it implicitly and explicitly.” The main object which Aristotle has in view (Metaph. VII. 1) is the definition of what this substance (οὐσία) really is. In this ontology or, as we call it, logic, he investigates and minutely distinguishes four principles (Metaph. I. 3): first, determination or quality as such, the wherefore of anything, essence or form; secondly, the matter; thirdly, the principle of motion; and fourthly, the principle of final cause, or of the good. In the later part of the Metaphysics Aristotle returns repeatedly to the determination of the Ideas, but here also a want of connection of thought appears, even though all is subsequently united into an entirely speculative Notion.

To proceed, there are two leading forms, which Aristotle characterizes as that of potentiality (δύναμις) and that of actuality (ἐνέργεια); the latter is still more closely characterized as entelechy (ἐντελεχεια) or free activity, which has the end (τὸ τέλος) in itself, and is the realization of this end. These are determinations which occur repeatedly in Aristotle, especially in the ninth book of the Metaphysics, and which we must be familiar with, if we would understand him. The expression δύναμις is with Aristotle the beginning, the implicit, the objective; also the abstract universal in general, the Idea, the matter, which can take on all forms, without being itself the form-giving principle. But with an empty abstraction such as the thing-in-itself Aristotle has nothing to do. It is first in energy or, more concretely, in subjectivity, that he finds the actualizing form, the self-relating negativity. When, on the other hand, we speak of Being, activity is not yet posited: Being is only implicit, only potentiality, without infinite form. To Aristotle the main fact about Substance is that it is not matter merely (Metaph. VII. 3); although in ordinary life this is what is generally taken to be the substantial. All that is contains matter, it is true, all change demands a

substratum (ὑποκείμενον) to be affected by it; but because matter itself is only potentiality, and not actuality — which belongs to form — matter cannot truly exist without the activity of form (Metaph. VIII. 1, 2). With Aristotle δύναμις does not therefore mean force (for force is really an imperfect aspect of form), but rather capacity which is not even undetermined possibility; ἐνέργεια is, on the other hand, pure, spontaneous activity. These definitions were of importance throughout all the middle ages. Thus, according to Aristotle, the essentially absolute substance has potentiality and actuality, form and matter, not separated from one another; for the true objective has most certainly also activity in itself, just as the true subjective has also potentiality.

From this definition we now see clearly the sort of opposition in which the Idea of Aristotle stands to that of Plato, for although the Idea of Plato is in itself essentially concrete and determined, Aristotle goes further. In so far, namely, as the Idea is determined in itself, the relation of the moments in it can be more closely specified, and this relation of the moments to each other is to be conceived of as nothing other than activity. It is easy for us to have a consciousness of what is deficient in the universal, that is, of that which is implicit only. The universal, in that it is the universal, has as yet no reality, for because implicitude is inert, the activity of realization is not yet posited therein. Reason, laws, etc., are in this way abstract, but the rational, as realizing itself, we recognize to be necessary, and therefore we take such universal laws but little into account. Now the standpoint of Plato is in the universal; what he does is to express Being rather as the objective, the Good, the end, the universal. To this, however, the principle of living subjectivity, as the moment of reality, seems to be lacking, or it appears at least to be put in the background. This negative principle seems indeed not to be directly expressed in Plato, but it is essentially contained in his definition of the Absolute as the unity of opposites; for this unity is

essentially a negative unity of those opposites, which abrogates their being-another, their opposition, and leads them back into itself. But with Aristotle this negativity, this active efficacy, is expressly characterized as energy; in that it breaks up itself — this independence — abrogating unity, and positing separation; for, as Aristotle says (Metaph. VII. 13), “actuality separates.” The Platonic Idea, on the other hand, is rather that abrogation of opposites, where one of the opposites is itself unity. While, therefore, with Plato the main consideration is the affirmative principle, the Idea as only abstractly identical with itself, in Aristotle there is added and made conspicuous the moment of negativity, not as change, nor yet as nullity, but as difference or determination. The principle of individualization, not in the sense of a casual and merely particular subjectivity, but in that of pure subjectivity, is peculiar to Aristotle. Aristotle thus also makes the Good, as the universal end, the substantial foundation, and maintains this position against Heraclitus and the Eleatics. The Becoming of Heraclitus is a true and real determination, but change yet lacks the determination of identity with itself, the constancy of the universal. The stream is ever changing, yet it is nevertheless ever the same, and is really a universal existence. From this it is at once evident that Aristotle (Metaph. IV. 3-6) is controverting the opinions of Heraclitus and others when he says that Being and non-being are not the same (Vol. I. p. 282), and in connection with this lays down the celebrated maxim of contradiction, that a man is not at the same time a ship. This shows at once that Aristotle does not understand by this pure Being and non-being, this abstraction which is really only the transition of the one into the other; but by that which is, he understands Substance, the Idea, Reason, viewed likewise as an impelling end. As he maintains the universal against the principle of mere change, he puts forward activity in opposition to the numbers of the Pythagoreans, and to the Platonic Ideas. However frequently and fully Aristotle controverts both of these, all his objections

turn on the remark already quoted (Vol. I. p. 213) that activity is not to be found in these principles, and that to say that real things participate in Ideas is empty talk, and a poetic metaphor. He says also that Ideas, as abstract universal determinations, are only as far as numbers go equal to things, but are not on that account to be pointed out as their causes. Moreover, he maintains that there are contradictions involved in taking independent species, since in Socrates, for instance, there are several ideas included: man, biped, animal (Metaph. I. 7 and 9). Activity with Aristotle is undoubtedly also change, but change that is within the universal, and that remains self-identical; consequently a determination which is self-determination, and therefore the self-realizing universal end: in mere alteration, on the contrary, there is not yet involved the preservation of identity in change. This is the chief point which Aristotle deals with.

Aristotle distinguishes various moments in substance, in so far as the moments of activity and potentiality do not appear as one, but still in separation. The closer determination of this relation of energy to potentiality, of form to matter, and the movement of this opposition, gives the different modes of substance. Here Aristotle enumerates the substances; and to him they appear as a series of different kinds of substance, which he merely takes into consideration one by one, without bringing them together into a system. The three following are the chief among these: —

a. The sensuous perceptible substance is that in which the matter is still distinguished from the efficient form. Hence this substance is finite; for the separation and externality of form and matter are precisely what constitute the nature of the finite. Sensuous substance, says Aristotle (Metaph. XII. 2), involves change, but in such a way that it passes over into the opposite; the opposites disappear in one another, and the third beyond these opposites, that which endures, the permanent in this change, is matter. Now the leading categories of change which Aristotle names are the four differences,

in regard to the What (κατὰ τὸ τί), or in regard to quality (ποιόν), or in regard to quantity (ποσόν), or in regard to place where (ποῦ). The first change is the origination and decay of simple determinate Being (κατὰ τόδε); the second change is that of the further qualities (κατὰ τὸ πάθος); the third, increase and diminution; the fourth, motion. Matter is the dead substance on which take place the changes which matter passes through. “The change itself is from potential into actual existence; possible whiteness transforms itself into actual whiteness. Thus things do not arise casually out of nothing, but all arises out of what exists, though it exists only in potentiality, not in actuality.” The possible is thus really a general implicit existence, which brings about these determinations, without producing one out of the other. Matter is thus simple potentiality, which, however, is placed in opposition to itself, so that a thing in its actuality only becomes that which its matter was also in potentiality. There are thus three moments posited: matter, as the general substratum of change, neutral in respect of what is different (ἐξ οὗ); the opposed determinations of form, which are negative to each other as that which is to be abrogated and that which is to be posited (τι and εἴς τι); the first mover (ὑφ᾽ οὗ), pure activity (Metaph. VII. 7; IX. 8; XII. 3).[89] But activity is the unity of form and matter; how these two are in the other, Aristotle does not, however, further explain. Thus in sensuous substance there appears the diversity of the moments, though not as yet their return into themselves; but activity is the negative which ideally contains in itself the opposite, therefore that also which is about to be.

b. A higher kind of substance, according to Aristotle (Metaph. IX. 2; VII. 7; XII. 3), is that into which activity enters, which already contains that which is about to be. This is understanding, absolutely determined, whose content is the aim which it realizes through its activity, not merely changing

as does the sensuous form. For the soul is essentially actuality, a general determination which posits itself; not only formal activity, whose content comes from somewhere else. But while the active posits its content in reality, this content yet remains the same; there is an activity present which is different from matter, although substance and activity are allied. Thus here we still have a matter which understanding demands as its hypothesis. The two extremes are matter as potentiality, and thought as efficiency: the former is the passive universal, and the latter the active universal; in sensuous substance the active is, on the contrary, still quite different from matter. In these two moments themselves change does not take place, for they are the implicit universal in opposed forms.

c. The highest point is, however, that in which potentiality, activity and actuality are united; the absolute substance which Aristotle (Metaph. XII. 6, 7; IX. 8), defines in general as being the absolute (ἀΐδιον), the unmoved, which yet at the same time moves, and whose essence is pure activity, without having matter. For matter as such is passive and affected by change, consequently it is not simply one with the pure activity of this substance. Here as elsewhere we certainly see an instance of merely denying a predicate, without saying what its truth is; but matter is nothing else than that moment of unmoved Being. If in later times it has seemed something new to define absolute Being as pure activity, we see that this arises from ignorance as to the Aristotelian conception. But the Schoolmen rightly looked upon this as the definition of God, since they define God as *actus purus*; and higher idealism than this there is none. We may also express this as follows: God is the Substance which in its potentiality has reality also unseparated from it; therein potentiality is not distinguished from form, since it produces from itself the determinations of its content. In this Aristotle breaks away from Plato, and for this reason controverts number, the Idea, and the universal, because if this, as inert, is not defined as

identical with activity, there is no movement. Plato's inert Ideas and numbers thus bring nothing into reality; but far different is the case with the Absolute of Aristotle, which in its quiescence is at the same time absolute activity.

Aristotle further says on this subject (Metaph. XII. 6): "It may be that what has potentiality is not real; it is of no avail therefore to make substances eternal, as the idealists do, if they do not contain a principle which can effect change. And even this is insufficient, if it is not active, because in that case there is no change. Yea, even if it were active, but its substance only a potentiality, there would be in it no eternal movement, for it is possible that what is according to potentiality may not exist. We must therefore have a principle whose substance must be apprehended as activity." Thus in mind energy is substance itself. "But here a doubt seems to spring up. For all that is active seems to be possible, but all that is possible does not seem to energize, so that potentiality seems to be antecedent," for it is the universal. "But if this were the case, no one of the entities would be in existence, for it is possible that a thing may possess a capacity of existence, though it has never yet existed. But energy is higher than potentiality. We must thus not assert, as theologians would have us do, that in the eternal ages there was first chaos or night" (matter), "nor must we say with natural philosophers that everything existed simultaneously. For how could the First be changed, if nothing in reality were cause? For matter does not move itself, it is the Master who moves it. Leucippus and Plato accordingly say that motion has always existed, but they give no reason for the assertion." Pure activity is, according to Aristotle (Metaph. IX. 8), before potentiality, not in relation to time, but to essence. That is to say, time is a subordinate moment, far removed from the universal; for the absolute first Being is, as Aristotle says at the end of the sixth chapter of the twelfth book, "that which in like activity remains always identical with

itself." In the former assumption of a chaos and so on, an activity is posited which has to do with something else, not with itself, and has therefore a presupposition; but chaos is only bare possibility.

That which moves in itself, and therefore, as Aristotle continues (Metaph. XII. 7), "that which has circular motion;" is to be posited as the true Being, "and this is evident not merely from thinking reason, but also from the fact itself." From the definition of absolute Being as imparting motion, as bringing about realization, there follows that it exists in objectivity in visible nature. As the self-identical which is visible, this absolute Being is "the eternal heavens." The two modes of representing the Absolute are thus thinking reason and the eternal heavens. The heavens are moved, but they also cause movement. Since the spherical is thus both mover and moved, there is a centre-point which causes movement but remains unmoved, and which is itself at the same time eternal and a substance and energy.[90] This great definition given by Aristotle of absolute Being as the circle of reason which returns into itself, is of the same tenor as modern definitions; the unmoved which causes movement is the Idea which remains self-identical, which, while it moves, remains in relation to itself. He explains this as follows: "Its motion is determined in the following manner. That moves which is desired and thought, whereas itself it is unmoved, and the original of both is the same." That is the end whose content is the desire and thought; such an end is the Beautiful or the Good. "For the thing that is desired is that which appears beautiful" (or pleases): "whose first" (or end), "on which the will is set, is what is beautiful. But it is rather the case that we desire it because it appears beautiful, than that it appears beautiful because we desire it." For if that were so, it would be simply posited by activity, but it is posited independently, as objective Being, through which our desire is first awakened. "But thought is the true principle in this, for thought is moved only by the object of thought. But the

intelligible" (we scarcely believe our eyes) "is essentially the other co-element (συστοιχία)"[91] namely, that which is posited as objective, as absolutely existent thought, "and the substance of this other element is the first; but the first substance is simple pure activity. Such are the Beautiful and the Good, and the first is ever the absolutely best or the best possible. But the Notion shows that the final cause belongs to the unmoved. What is moved may also subsist in a different manner. Motion (φορά) is the first change; the first motion, again, is circular motion, but this is due to the above cause." Therefore, according to Aristotle, the Notion, *principium cognoscendi*, is also that which causes movement, *principium essendi*; he expresses it as God, and shows the relation of God to the individual consciousness. "The First Cause is necessary. But the term necessary has three meanings: first what is accomplished by violence, because it goes contrary to one's inclination (παρὰ τὴν ὁρμήν); secondly, that without which the Good does not subsist; thirdly, that which can exist in no other way than it does, but involves absolute existence. On such a principle of the unmoved the heavens depend and the whole of nature" — the visible that is eternal, and the visible that changes. This system is ever-enduring. "But to us" as individuals, "there is granted, for a short time only, a sojourn therein of surpassing excellence. For the system continues ever the same, but for us that is impossible. Now this activity is in its very self enjoyment, and therefore vigilance, exercise of the senses, thinking in general, are most productive of enjoyment; and for the same reason hopes and memories bring pleasure. But thinking, in its pure essence, is a thinking of that which is absolutely the most excellent;" the thought is for itself absolute end. The difference and contradiction in activity and the abrogation of the same, Aristotle expresses thus: "But thought thinks itself by participation (μετάληψιν) in that which is thought, but thought becomes thought by contact and apprehension, so that thought and the object of thought are the

same.” Thought, as being the unmoved which causes motion, has an object, which, however, becomes transformed into activity, because its content is itself something thought, *i.e.* a product of thought, and thus altogether identical with the activity of thinking. The object of thought is first produced in the activity of thinking, which in this way separates the thought as an object. Hence, in thinking, that which is moved and that which moves are the same; and as the substance of what is thought is thought, what is thought is the absolute cause which, itself unmoved, is identical with the thought which is moved by it; the separation and the relation are one and the same. The chief moment in Aristotle’s philosophy is accordingly this, that the energy of thinking and the object of thought are the same; “for thought is that which is receptive of objects of perception and the existent. When in possession of these it is in a condition of activity (ἐνεργεῖ δὲ ἔχων); and thus all this” operation by which it thinks itself, “is more divine than the divine possession which thinking reason supposes itself to have,” — the content of thought. It is not the object of thought that is the more excellent, but the very energy of thinking; the activity of apprehension brings that to pass which appears as something that is being apprehended. “Speculation (ἡ θεωρία) is thus the most pleasing and the best. If then God has eternally subsisted in such surpassing excellence as for a limited time pertains to us” (in whom this eternal Thought, which is God Himself, occurs only as a particular condition), “He is worthy of admiration; if He possesses it in a more eminent degree, His nature is still more admirable. But this is His mode of subsistence. Life is also inherent in Him, for the activity of thought is life. But He constitutes this efficient power; essential energy belongs to God as His most excellent and eternal life. We therefore say that with God there is life perfect and everlasting.” From this substance Aristotle moreover excludes magnitude.

We in our way of speaking designate the Absolute, the True, as the unity of subjectivity and objectivity, which is therefore neither the one nor the other, and yet just as much the one as the other; and Aristotle busied himself with these same speculations, the deepest forms of speculation even of the present day, and he has expressed them with the greatest definiteness. With Aristotle it is thus no dry identity of the abstract understanding that is indicated, for he distinguishes subjective and objective precisely and decisively. Not dead identity such as this, but energy, is for him what is most to be reverenced, God. Unity is thus a poor, unphilosophic expression, and true Philosophy is not the system of identity; its principle is a unity which is activity, movement, repulsion, and thus, in being different, is at the same time identical with itself. If Aristotle had made the jejune identity of understanding, or experience, his principle, he would never have risen to a speculative Idea like this, wherein individuality and activity are placed higher than universal potentiality. Thought, as the object of thought, is nothing else than the absolute Idea regarded as in itself, the Father; yet this First and unmoved, as distinguished from activity, is, as absolute, simply activity, and is first through this activity set forth as true. In what he teaches respecting the soul we shall find Aristotle recurring to this speculative thought; but to Aristotle it is again an object, like other objects, a kind of condition which he separates from the other conditions of the soul which he understands empirically, such as sleep, or weariness. He does not say that it alone is truth, that all is summed up in Thought, but he says it is the first, the strongest, the most honourable. We, on the other hand, say that Thought, as that which relates to itself, has existence, or is the truth; that Thought comprehends the whole of Truth, even, though we ordinarily represent to ourselves sensation and so on, besides thought, as having reality. Thus, although Aristotle does not express himself in modern philosophic language, he has yet throughout the same fundamental theory; he speaks not

of a special kind of reason, but of the universal Reason. The speculative philosophy of Aristotle simply means the direction of thought on all kinds of objects, thus transforming these into thoughts; hence, in being thoughts, they exist in truth. The meaning of this is not, however, that natural objects have thus themselves the power of thinking, but as they are subjectively thought by me, my thought is thus also the Notion of the thing, which therefore constitutes its absolute substance. But in Nature the Notion does not exist explicitly as thought in this freedom, but has flesh and blood, and is oppressed by externalities; yet this flesh and blood has a soul, and this is its Notion. The ordinary definition of truth, according to which it is "the harmony of the conception with the object," is certainly not borne out by the conception; for when I represent to myself a house, a beam, and so on, I am by no means this content, but something entirely different, and therefore very far from being in harmony with the object of my conception. It is only in thought that there is present a true harmony between objective and subjective; that constitutes me. Aristotle therefore finds himself at the highest standpoint; nothing deeper can we desire to know, although he has always the appearance of making ordinary conceptions his starting-point.

Aristotle (Metaph. XII. 9) now solves many other doubtful questions, for instance, whether thought is compound, and whether science is the object of science itself. "Some further doubts arise as to thought (νοῦς), which seems to be of all things the most divine; but it is only with difficulty that we can conceive under what conditions (πῶς δ' ἔχων) it is a thing of this sort. When it thinks of nothing, but is in a state like that of a sleeper, what constitutes its superiority? And when it thinks, but something else is dominant all the time (ἄλλο κύριον), that which is its substance is not thought (νόησις), but a potentiality;" it would not be in eternal activity. "In this way it would not be the highest substance; for it is" (active) "thought (τὸ νοεῖν) that gives it its high rank. If now, further, thought or thinking is its substance, what does it

think? Itself or another? And if another, is it always the same, or something different? Does it also not make a difference, whether it thinks of what is beautiful or what is casual? In the first place, if thought is not thinking, but only the power to think, continuous thinking would be laborious for it," for every power wears itself out. "In the next place, something else would be more excellent than thought, namely that which is thought (νοούμενον); and thinking and thought (τὸ νοεῖν καὶ ἡ νόησις) will be present to the mind in understanding what is most inferior. As this is to be avoided (in the same way that it is better not to see some things than to see them), thinking would not constitute the best. Thought is therefore this, to think itself, because it is the most excellent; and it is the thinking, which is the thinking of thinking. For understanding and sensation and opinion and deliberation seem always to have an object other than themselves, and to be their own objects only in a secondary sense. Further, if thinking and being thought of are different, in relation to which of the two is the Good inherent in thought? For the Notion[92] of thinking and that of the object of thought are not the same. Or, in the case of some things, does the science itself constitute that which is the object of science? In what is practical the thing is the immaterial substance and the determination of the end (ἡ οὐσία καὶ τὸ τί ἦν εἶναι), and in what is theoretical it is the reason and the thinking. As therefore thought and the object of thought are not different, these opposites, so far as they involve no connection with matter, are the same thing, and there is only a thought of the thing thought of." Reason which thinks itself, is the absolute end or the Good, for it only exists for its own sake. "There still remains a doubt whether that which thinks is of composite nature or not; for it might undergo change in the parts of the whole. But the Good is not in this or that part, for it is the best in the universe, as distinguished from it. In this way the Thought which is its own object subsists to all eternity."

As this speculative Idea, which is the best and most free, is also to be seen in nature, and not only in thinking reason, Aristotle (Metaph. XII. 8) in this connection passes on to the visible God, which is the heavens. God, as living God, is the universe; and thus in the universe God, as living God, shows Himself forth. He comes forth as manifesting Himself or as causing motion, and it is in manifestation alone that the difference between the cause of motion and that which is moved comes to pass. "The principle and the first cause of that which is, is itself unmoved, but brings to pass the original and eternal and single motion," that is, the heaven of the fixed stars. "We see that besides the simple revolution of the universe, which is brought about by the first unmoved substance, there are other eternal motions, those of the planets." We must not, however, enter into further details on this subject.

Regarding the organization of the universe in general, Aristotle says (Metaph. XII. 10), "We must investigate in what manner the nature of the whole has within it the Good and the Best; whether as something set apart and absolute, or as an order, or in both ways, as in the case of an army. For the good condition of an army depends upon the order enforced, as much as on the general, and the general is the cause of the army's good condition in all the greater degree from the fact of the order being through him, and not from his being through the order. All things are co-ordinated in a certain way, but not all in the same way: take, for example, animals which swim, and those which fly, and plants; they are not so constituted that one of them is not related to another, but they stand in mutual relations. For all are co-ordinated into one system just as in a house it is by no means permitted to the free inmates to do freely whatever they like, but all that they do, or the most of it, is done according to orderly arrangement. By slaves and animals, on the contrary, little is done for the general good, but they do much that is casual. For the principle of each is his own nature. In the same way it is

necessary that all should attain to a position where distinction is drawn" (the seat of judgment) "but there are some things so constituted that all participate in them for the formation of a whole." Aristotle then goes on to refute some other notions; showing, for instance, the embarrassments into which they fall who make all things proceed from oppositions, and he corroborates, on the other hand, the unity of the principle by quoting Homer's line (Iliad II. 204):

"It is not good that many govern; let one alone bear rule."

2. Philosophy of Nature.

Amongst the special sciences treated by Aristotle, the Physics is contained in a whole series of physical treatises, which form a tolerably complete system of what constitutes the Philosophy of Nature in its whole extent. We shall try to give their general plan. Aristotle's first work is his Treatise, in eight books, on Physics, or on the Principles (φυσικὴ ἀκρόασις ἢ περὶ ἀρχῶν). In this he deals, as is fitting, with the doctrine of the Notion of nature generally, with movement, and with space and time. The first manifestation of absolute substance is movement, and its moments are space and time; this conception of its manifestation is the universal, which realizes itself first in the corporeal world, passing into the principle of separation. Aristotle's Physics is what for present physicists would, properly speaking, be the Metaphysics of Nature; for our physicists only say what they have seen, what delicate and excellent instruments they have made, and not what they have thought. This first work by Aristotle is followed by his treatises concerning the Heavens, which deal with the nature of body and the first real bodies, the earth and heavenly bodies in general, as also with the general abstract relation of bodies to one another through mechanical weight and lightness, or what we should call attraction; and finally, with the determination of abstract real bodies or elements. Then

follow the treatises on Production and Destruction, the physical process of change, while formerly the ideal process of movement was considered. Besides the physical elements, moments which are only posited in process, as such, now enter in: for instance, warmth, cold, &c. Those elements are the real existent facts, while these determinations are the moments of becoming or of passing away, which exist only in movement. Then comes the Meteorology; it represents the universal physical process in its most real forms. Here particular determinations appear, such as rain, the saltness of the sea, clouds, dew, hail, snow, hoar-frost, winds, rainbows, boiling, cooking, roasting, colours, &c. On certain matters, such as the colours, Aristotle wrote particular treatises. Nothing is forgotten, and yet the presentation is, on the whole, empiric. The book On the Universe, which forms the conclusion, is said not to be genuine; it is a separate dissertation, addressed to Alexander, which contains in part the doctrine of the universality of things, a doctrine found already in the other treatises; hence this book does not belong to this series.

From this point Aristotle proceeds to organic nature, and here his works not only contain a natural history, but also a physiology and anatomy. To the anatomy pertain his works on the Locomotion of Animals, and on the Parts of Animals. He deals with physiology in the works on the Generation of Animals, on the common Movement of Animals; and then he comes to the distinction between Youth and Age, Sleeping and Waking, and treats of Breathing, Dreaming, the Shortness and Length of Life, &c., all of which he deals with partly in an empiric, and partly in a more speculative manner. Finally, there comes the History of Animals, not merely as a history of Nature, but also as the history of the animal in its entirety — what we may call a kind of physiologico-anatomical anatomy. There is likewise a botanical work On Plants (περὶ φυτῶν) which is ascribed to him. Thus we here find natural philosophy in the whole extent of its outward content.

As regards this plan, there is no question that this is not the necessary order in which natural philosophy or physics must be treated. It is long since physics adopted in its conception the form and tendency derived from Aristotle, of deducing the parts of the science from the whole; and thus even what is not speculative still retains this connection as far as outward order goes. This is plainly to be preferred to the arrangement in our modern text-books, which is a wholly irrational succession of doctrines accidentally put together, and is undoubtedly more suitable to that method of contemplating nature, which grasps the sensuous manifestation of nature quite irrespective of sense or reason. Physics before this contained some metaphysics, but the experience which was met with in endeavouring unsuccessfully to work it out, determined the physicists, so far as possible, to keep it at a distance, and to devote their attention to what they call experience, for they think that here they come across genuine truth, unspoiled by thought, fresh from the hand of nature; it is in their hands and before their faces. They can certainly not dispense with the Notion, but through a kind of tacit agreement they allow certain conceptions, such as forces, subsistence in parts, &c., to be valid, and make use of these without in the least knowing whether they have truth and how they have truth. But in regard to the content they express no better the truth of things, but only the sensuous manifestation. Aristotle and the ancients understand by physics, on the other hand, the comprehension of nature — the universal; and for this reason Aristotle also calls it the doctrine of principles. For in the manifestation of nature this distinction between the principle and what follows it, manifestation, really commences, and it is abrogated only in genuine speculation. Yet if, on the one hand, what is physical in Aristotle is mainly philosophic and not experimental, he yet proceeded in his Physics in what may be called an empiric way. Thus, as it has been already remarked of the Aristotelian philosophy in general that the different parts fall into a series of independently determined

conceptions, so we find that this is the case here also; hence an account can only be given of a part of them. One part is not universal enough to embrace the other part, for each is independent. But that which follows, and which has in great measure reference to what is individual, no longer comes under the dominion of the Notion, but becomes a superficial suggestion of reasons, and an explanation from the proximate causes, such as we find in our physics.

In regard to the general conception of nature, we must say that Aristotle represents it in the highest and truest manner. For in the Idea of nature Aristotle (Phys. II. 8) really relies on two determinations: the conception of end and the conception of necessity. Aristotle at once grasps the whole matter in its principles, and this constitutes the old contradiction and divergence of view existing between necessity (*causæ efficientes*) and end (*causæ finales*), which we have inherited. The first mode of consideration is that in accordance with external necessity, which is the same as chance — the conception that all that pertains to nature is determined from without by means of natural causes. The other mode of consideration is the teleological, but conformity to end is either inward or outward, and in the more recent culture the latter has long retained the supremacy. Thus men vibrate in their opinion between these two points of view, seek external causes, and war against the form of an external teleology which places the end outside of nature. These determinations were known to Aristotle, and he thoroughly investigates them and considers what they are and mean. Aristotle's conception of nature is, however, nobler than that of to-day, for with him the principal point is the determination of end as the inward determinateness of natural things. Thus he comprehended nature as life, *i.e.* as that which has its end within itself, is unity with itself, which does not pass into another, but, through this principle of activity, determines changes in conformity with its own content, and in this way maintains itself therein.

In this doctrine Aristotle has before his eyes the inward immanent end, to which he considers necessity an external condition. Thus, on the one hand, Aristotle determines nature as the final cause, which is to be distinguished from what is luck or chance; it is thus opposed by him to what is necessary, which it also contains within itself; and then he considers how necessity is present in natural things. In nature we usually think of necessity first, and understand as the essentially natural that which is not determined through end. For long men thought that they determined nature both philosophically and truly in limiting it to necessity. But the aspect of nature has had a stigma removed from it, because, by means of its conformity to the end in view, it is elevated above the commonplace. The two moments which we have considered in substance, the active form and matter, correspond with these two determinations.

We must first consider the conception of adaptation to end as the ideal moment in substance. Aristotle begins (Phys. II. 8) with the fact that the natural is the self-maintaining, all that is difficult is its comprehension. "The first cause of perplexity is, what hinders nature from not operating for the sake of an end, and because it is better so to operate, but" being, for example, "like Jupiter, who rains, not that the corn may grow, but from necessity. The vapour driven upwards cools, and the water resulting from this cooling falls as rain, and it happens that the corn is thereby made to grow. In like manner, if the corn of any one is destroyed, it does not rain for the sake of this destruction, but this is an accidental circumstance." That is to say, there is a necessary connection which, however, is an external relation, and this is the contingency of the cause as well as of the effect. "But if this be so," Aristotle asks, "what hinders us from assuming that what appears as parts" (the parts of an animal, for instance) "may thus subsist in nature, too, as contingent? That, for example, the front teeth are sharp and adapted for dividing, and that the back teeth, on the contrary, are

broad and adapted for grinding the food in pieces, may be an accidental circumstance, not necessarily brought about for these particular ends. And the same is true with respect to the other parts of the body which appear to be adapted for some end; therefore those living things in which all was accidentally constituted as if for some end, are now, having once been so existent, preserved, although originally they had arisen by chance, in accordance with external necessity." Aristotle adds that Empedocles especially had these reflections, and represented the first beginnings of things as a world composed of all sorts of monstrosities, such as bulls with human heads; such, however, could not continue to subsist, but disappeared because they were not originally constituted so that they should endure; and this went on until what was in conformity with purpose came together. Without going back to the fabulous monstrosities of the ancients, we likewise know of a number of animal tribes which have died out, just because they could not preserve the race. Thus we also require to use the expression development (an unthinking evolution), in our present-day natural philosophy. The conception that the first productions were, so to speak, attempts, of which those which did not show themselves to be suitable could not endure, is easily arrived at by natural philosophy. But nature, as *entelecheia* or realization, is what brings forth itself. Aristotle hence replies: "It is impossible to believe this. For what is produced in accordance with nature is always, or at least for the most part, produced" (external universality as the constant recurrence of what has passed away), "but this is not so with what happens through fortune or through chance. That in which there is an end (τέλος), equally in its character as something which precedes and as something which follows, is made into end; as therefore a thing is made, so is its nature, and as is its nature, so is it made; it exists therefore for the sake of this." The meaning of nature is that as something is, it was in the beginning; it means this inward universality and

adaptation to end that realizes itself; and thus cause and effect are identical, since all individual parts are related to this unity of end. "He who assumes contingent and accidental forms, subverts, on the other hand, both nature itself and that which subsists from nature, for that subsists from nature which has a principle within itself, by whose means, and being continually moved, it attains its end." In this expression of Aristotle's we now find the whole of the true profound Notion of life, which must be considered as an end in itself — a self-identity that independently impels itself on, and in its manifestation remains identical with its Notion: thus it is the self-effectuating Idea. Leaves, blossoms, roots thus bring the plant into evidence and go back into it; and that which they bring to pass is already present in the seed from which they took their origin. The chemical product, on the contrary, does not appear to have itself similarly present, for from acid and base a third appears to come forth; but here, likewise, the essence of both these sides, their relationship, is already present, though it is there mere potentiality, as it is in the product merely a thing. But the self-maintaining activity of life really brings forth this unity in all relationships. What has here been said is already contained in that which was asserted by those who do not represent nature in this way, but say, "that which is constituted as though it were constituted for an end, will endure." For this is the self-productive action of nature. In the modern way of looking at life this conception becomes lost in two different ways; either through a mechanical philosophy, in which we always find as principle pressure, impulse, chemical relationships and forces, or external relations generally — which certainly seem to be inherent in nature, but not to proceed from the nature of the body, seeing that they are an added, foreign appendage, such as colour in a fluid; or else theological physics maintain the thoughts of an understanding outside of the world to be the causes. In the Kantian philosophy we for the first time have that conception once more awakened

in us, for organic nature at least; life has there been made an end to itself. In Kant this indeed had only the subjective form which constitutes the essence of the Kantian philosophy, in which it seems as though life were only so determined by reason of our subjective reasoning; but still the whole truth is there contained that the organic creation is the self-maintaining. The fact that most recent times have brought back the rational view of the matter into our remembrance, is thus none else than a justification of the Aristotelian Idea.

Aristotle also speaks of the end which is represented by organic nature in itself, in relation to the means, of which he says (Phys. II. 8): "If the swallow builds her nest, and the spider spreads her web, and trees root themselves in the earth, for the sake of nutriment, there is present in them a self-maintaining cause of this kind, or an end." For this instinctive action exhibits an operation of self-preservation, as a means whereby natural existence becomes shut up and reflected into itself. Aristotle then brings what is here said into relation with general conceptions which he had earlier maintained (p. 138): "Since nature is twofold as matter and form, but since the latter is end, and the rest are on account of the end, this is final cause." For the active form has a content, which, as content of potentiality, contains the means which make their appearance as adapted for an end, *i.e.* as moments established through the determinate Notion. However much we may, in the modern way of regarding things, struggle against the idea of an immanent end, from reluctance to accept it, we must, in the case of animals and plants, acknowledge such a conception, always re-establishing itself in another. For example, because the animal lives in water or in air, it is so constructed that it can maintain its existence in air or water; thus it requires water to explain the gills of fishes; and, on the other hand, because the animal is so constructed, it lives in water. This activity in transformation thus does not depend in a contingent way on life; it is aroused through the

outward powers, but only in as far as conformity with the soul of the animal permits.

In passing, Aristotle here (Phys. II. 8) makes a comparison between nature and art, which also connects what results with what goes before, in accordance with ends. “Nature may commit an error as well as art; for as a grammarian sometimes makes a mistake in writing, and a physician in mixing a medicinal draught, nature, too, sometimes does not attain its ends. Its errors are monstrosities and deformities, which, however, are only the errors of that which operates for an end. In the production of animals and plants, an animal is not at first produced, but the seed, and even in it corruption is possible.” For the seed is the mean, as being the not as yet established, independent, indifferent, free actuality. In this comparison of nature with art we ordinarily have before us the external adaptation to end, the teleological point of view, the making for definite ends. And Aristotle declaims against this, while he remarks that if nature is activity for a certain end, or if it is the implicitly universal, “it is absurd to deny that action is in conformity with end, because that which moves cannot be seen to have deliberated and considered.” The understanding comes forward with the determination of this end, and with its instruments and tools, to operate on matter, and we carry this conception of an external teleology over into nature. “But art also,” says Aristotle, “does not deliberate. If the form of a ship were the particular inward principle of the timber, it would act as nature prompted. The action of nature is very similar to the exercise of the art whereby anyone heals himself.” Through an inward instinct the animal avoids what is evil, and does what is good for him; health is thus essentially present to him, not as a conscious end, but as an understanding which accomplishes its ends without conscious thought.

As Aristotle has hitherto combated an external teleology, he directs another equally applicable remark (Phys. II. 9) against merely external

necessity, and thus we come to the other side, or to how necessity exists in nature. He says in this regard: “Men fancy that necessity exists in this way in generation, just as if it were thought that a house existed from necessity, because heavy things were naturally carried downwards, and light things upwards, and that, therefore, the stones and foundation, on account of their weight, were under the earth, and the earth, because it was lighter, was further up, and the wood in the highest place because it is the lightest.” But Aristotle thus explains the facts of the case. “The house is certainly not made without these materials, but not on account of, or through them (unless the material so demands), but it is made for the sake of concealing and preserving certain things. The same takes place in everything which has an end in itself; for it is not without that which is necessary to its nature, and yet it is not on account of this, unless the matter so demands, but on account of an end. Hence the necessary is from hypothesis only, and not as end, for necessity is in matter, but end is in reason (λόγῳ). Thus it is clear that matter and its movement are necessity in natural things; both have to be set forth as principle, but end is the higher principle.” It undoubtedly requires necessity, but it retains it in its own power, does not allow it to give vent to itself, but controls external necessity. The principle of matter is thus turned into the truly active ground of end, which means the overthrow of necessity, so that that which is natural shall maintain itself in the end. Necessity is the objective manifestation of the action of its moments as separated, just as in chemistry the essential reality of both the extremes — the base and the acid — is the necessity of their relation.

This is the main conception of Aristotelian Physics. Its further development concerns the conceptions of the different objects of nature, a material for speculative philosophy which we have spoken of above (pp. 153-155), and regarding which Aristotle puts before us reflections both difficult and profound. Thus he at first (Phys. III. 1-3) proceeds from this

point to movement (κίνησις), and says that it is essential that a philosophy of nature should speak of it, but that it is difficult to grasp; in fact, it is one of the most difficult conceptions. Aristotle thus sets to work to understand movement in general, not merely in space and time, but also in its reality; and in this sense he calls it “the activity of an existent thing which is in capacity, so far as it is in capacity.” He explains this thus: “Brass is in capacity a statue; yet the motion to become a statue is not a motion of the brass so far as it is brass, but a motion of itself, as the capacity to become a statue. Hence this activity is an imperfect one (ἀτελής),” *i.e.* it has not its end within itself, “for mere capacity, whose activity is movement, is imperfect.” The absolute substance, the moving immovable, the existent ground of heaven which we saw as end, is, on the contrary, both activity itself and the content and object of activity. But Aristotle distinguishes from this what falls under the form of this opposition, “That moving is also moved which has movement as a capacity, and whose immobility is rest. That in which movement is present has immobility as rest; for activity in rest, as such, is movement.” That is to say, rest is capacity for motion. “Hence movement is the activity of that which is movable (κινητοῦ),[93] so far as it is movable; but this happens from the contact of that which is motive (κινητικοῦ), so that at the same time it is posited as passive likewise. But that which moves always introduces a certain form or end (εἶδος), either this particular thing (τόδε), or a quality or a quantity, which is the principle and cause of the motion when it moves; thus man, as he is in energy, makes man from man as he is in capacity. Thus, too, it is evident that movement is in the movable thing: for it is the activity of this, and is derived from that which is motive. The activity of that which is motive is likewise not different, for both are necessarily activity. It is motive because it has the capacity for being so; but it causes motion because it energizes. But it is the energetic of the moveable (ἔστιν ἐνεργητικὸν τοῦ κινετοῦ), so

that there is one energy of both; just as the relation between one and two is the same as that between two and one, and there also is the same relation between acclivity and declivity, so the way from Thebes to Athens is the same as from Athens to Thebes. Activity and passivity are not originally (κυρίως) the same, but in what they are inherent, in motion, they are the same. In Being (τῷ εἶναι) they are identical, but activity, in so far as it is activity of this in this" (what is moved), "and the activity of this from this" (what moves), "is different as regards its conception (τῷ λόγῳ)." Aristotle subsequently deals with the infinite (Phys. III. 4-8).

"In like manner it is necessary," says Aristotle (Phys. IV. 1-5), "that the natural philosopher should consider the subject of place (τόπος)." Here come various definitions and determinations under which space generally and particular space or place appear. "Is place a body? It cannot be a body, for then there would be in one and the same, two bodies. Again, if it is the place and receptacle (χώρα) of this body, it is evident that it is so also of the superficies and the remaining boundaries; but the same reasoning applies to these, for where the superficies of water were before, there will now be the superficies of air," and thus the places of both superficies would be in one. "But in truth there is no difference between the point and the place of the point, so that if place is not different from the other forms of limitation, neither is it something outside of them. It is not an element, and neither consists of corporeal nor of incorporeal elements, for it possesses magnitude, but not body. The elements of bodies are, however, themselves bodies, and no magnitude is produced from intelligible elements. Place is not the material of things, for nothing consists of it — neither the form, nor the Notion, nor the end, nor the moving cause; and yet it is something." Aristotle now determines place as the first unmoved limit of that which is the comprehending: it comprehends the body whose place it is, and has nothing of the thing in itself; yet it co-exists with the thing, because the

limits and the limited co-exist. The uttermost ends of what comprehends and of what is comprehended are identical, for both are bounds; but they are not bounds of the same, for form is the boundary of the thing, place is that of the embracing body. Place, as the comprehending, remains unchangeably passive while the thing which is moved is moved away; from which we see that place must be separable from the thing. Or place, according to Aristotle, is the boundary, the negation of a body, the assertion of difference, of discretion; but it likewise does not merely belong to this body, but also to that which comprehends. There is thus no difference at all, but unchangeable continuity. "Place is neither the universal (κοινός) in which all bodies are" (heaven), "nor the particular (ἴδιος), in which they are as the first (πρώτῳ)." Aristotle also speaks of above and below in space, in relation to heaven as that which contains, and earth as what is beneath. "That body, outside of which is a comprehending body, is in space. But the whole heavens are not anywhere, since no body comprehends them. Outside the universe nothing is, and hence everything is in the heavens, for the heavens are the whole. Place, however, is not the heavens, but its external quiescent boundary which touches the body moved. Hence the earth is in water, water in air, air in ether, but ether in the heavens."

From this point Aristotle goes on (Phys. IV. 6, 7) to empty space, in which an old question is involved which physicists even now cannot explain: they could do so if they studied Aristotle, but as far as they are concerned there might have been no thought nor Aristotle in the world. "Vacuum, according to ordinary ideas, is a space in which there is no body, and, fancying that all Being is body, they say that vacuum is that in which there is nothing at all. The conception of a vacuum has its justification for one thing in the fact that a vacuum," the negative to an existent form, "is essential to motion; for a body could not move in a plenum," and in the place to which it does move there must be nothing. "The other argument in

favour of a vacuum is found in the compression of bodies, in which the parts press into the empty spaces.” This is the conception of varying density and the alteration of the same, in accordance with which an equal weight might consist of an equal number of parts, but these, as being separated by vacuum, might present a greater volume. Aristotle confutes these reasonings most adroitly, and first of all in this way; “The plenum could be changed, and bodies could yield to one another even if no interval of vacuum separated them. Liquids as well as solids are not condensed into a vacuum; something that they contained is expelled, just as air is expelled if water is compressed.”

Aristotle deals more thoroughly, in the first place (Phys. IV. 8), with the erroneous conception that the vacuum is the cause of movement. For, on the one hand, he shows that the vacuum really abolishes motion, and consequently in vacuum a universal rest would reign. He calls it perfect indifference as to the greater or less distance to which a thing is moved; in vacuum there are no distinctions. It is pure negation without object or difference; there is no reason for standing still or going on. But body is in movement, and that, indeed, as distinguished; it has a positive relation, and not one merely to nothing. On the other hand, Aristotle refutes the idea that movement is in vacuum because compression is possible. But this does not happen in a vacuum; there would be established in it not one movement, but a movement towards all sides, a general annihilation, an absolute yielding, where no cohesion would remain in the body. “Again, a weight or a body is borne along more swiftly or more slowly from two causes; either because there is a difference in that through which it is borne along, as when it moves through air or water or earth, or because that which is borne along differs through excess of weight or lightness.” As regards difference of movement on account of the first difference — that in the density of the medium — Aristotle says: “The medium through which the body is borne

along is the cause of the resistance encountered, which is greater if the medium is moving in a contrary direction (and less if it is at rest); resistance is increased also if the medium is not easily divided. The difference in velocity is in inverse ratio to the specific gravity of the medium, air and water, so that if the medium has only half the density, the rate of progress will be double as quick. But vacuum has to body no such relation of differences of specific gravity. Body can no more contain a vacuum within its dimensions than a line can contain a point, unless the line were composed of points. The vacuum has no ratio to the plenum." But as to the other case, the difference in weight and lightness, which has to be considered as being in bodies themselves, whereby one moves more quickly than another through the same space: "this distinction exists only in the plenum, for the heavy body, by reason of its power, divides the plenum more quickly." This point of view is quite correct, and it is mainly directed against a number of conceptions that prevail in our physics. The conception of equal movement of the heavy and the light, as that of pure weight, pure matter, is an abstraction, being taken as though they were inherently like, only differing through the accidental resistance of the air.

Aristotle (Phys. IV. 9) now comes to the second point, to the proof of the vacuum because of the difference in specific gravity. "Many believe that the vacuum exists because of the rare and the dense;" the former is said to be a rare body, and the latter a perfect continuity; or they at least differ quantitatively from one another through greater or less density. "For if air should be generated from a quantity of water, a given quantity of water must produce a quantity of air the same in bulk, or there must necessarily be a vacuum; for it is only on the hypothesis of a vacuum that compression and rarefaction are explicable. Now if, as they say, the less dense were that which has many separate void spaces, it is evident that since a vacuum cannot be separated any more than a space can have intervals, neither can

the rare subsist in this manner. But if it is not separable, and yet a vacuum is said to exist in the body, in the first place movement could thus only be upwards; for the rare is the light, and hence they say that fire is rare," because it always moves upwards. "In the next place the vacuum cannot be the cause of motion as that in which something moves, but must resemble bladders that carry up that which adheres to them. But how is it possible that a vacuum can move, or that there can be a place where there is a vacuum? For that into which it is carried would be the vacuum of a vacuum. In short, as there can be no movement in vacuum, so also a vacuum cannot move." Aristotle set against these ideas the true state of matters, and states generally the ideal conception of nature: "that the opposites, hot and cold, and the other physical contraries, have one and the same matter, and that from what is in capacity that which is in energy is produced; that matter is not separable though it is different in essence[94] (τῷ εἶναι), and that it remains one and the same in number (ἀριθμῷ) even if it possesses colour, or is hot and cold. And again, the matter of a small body and a large is the same, because at one time a greater proceeds from a smaller, and at another time a smaller from a greater. If air is generated from water it is expanded, but the matter remains the same and without taking to itself anything else; for that which it was in capacity it becomes in actuality. In a similar way if air is compressed from a greater into a less volume, the process will be reversed, and air will similarly pass into water, because the matter which is in capacity both air and water, also becomes both." Aristotle likewise asserts that increase and decrease of warmth, and its transition into cold, is no addition or otherwise of warm matter, and also one and the same is both dense and rare. This is very different from the physical conceptions which assert more or less matter to correspond with more or less density, thus comprehending the difference in specific weight as the external addition of matter. Aristotle, on the contrary, takes this dynamically, though certainly

not in the sense in which dynamics are to-day understood, viz. as an increase of intensity or as a degree, for he accepts intensity in its truth as universal capacity. Undoubtedly the difference must also be taken as a difference in amount, but not as an increase and decrease, or as an alteration in the absolute quantity of the matter. For here intensity means force, but again not as being a thing of thought separated from matter, but as indicating that if anything has become more intensive, it has had its actuality diminished, having, however, according to Aristotle, attained to a greater capacity. If the intensity is again directed outwards, and compared with other things, it undoubtedly becomes degree, and therefore magnitude immediately enters in. It then is indifferent whether greater intension or greater extension is posited; more air is capable of being warmed to the same degree as less, through the greater intensity of the warmth; or the same air can thereby become intensively warmer.

As regards the investigation of time, Aristotle remarks (Phys. IV. 10, 11, 13) that if time is externally (exoterically, ἐξωτερικῶς) regarded, we are inevitably led to doubt (διαπορῆσαι) whether it has any being whatever, or whether it has bare existence, as feeble (μόλις καὶ ἀμυδρῶς) as if it were only a potentiality. "For one part of it was and is not: another part will be and is not as yet; but of these parts infinite and everlasting (ἀεὶ λαμβανόμενος), time is composed. But it now appears that time, if composed of things that are not, may be incapable of existence. And also as regards everything divisible, if it exists, either some or all of its parts must be. Time is certainly divisible; but some of the parts are past, others are future, and no part is present. For the *now* is no part, since a part has a measure, and the whole must consist of the parts; but time does not appear to consist of the Now." That is to say, because the Now is indivisible, it has no quantitative determination which could be measured. "Besides it is not easy to decide whether the Now remains, or always becomes another and

another. Again, time is not a movement and change, for movement and change occur in that which is moved and changed, or accompany time in its course; but time is everywhere alike. Besides change is swifter and slower, but time is not. But it is not without change and motion" (which is just the moment of pure negativity in the same) "for when we perceive no change, it appears as if no time had elapsed, as in sleep. Time is hence in motion but not motion itself." Aristotle defines it thus: "We say that time is, when we perceive the before and after in movement; but these are so distinguished that we apprehend them to be another and another, and conceive that there is something between, as a middle. Now when we understand that the extremes of the conclusion are different from the middle, and the soul says that the Now has two instants, the one prior and the other posterior, then we say that this is time. What is determined through the Now, we call time, and this is the fundamental principle. But when we are sensible of the Now as one, and not as a prior and posterior in motion, nor as the identity of an earlier or later, then there does not appear to us to have been any time, because neither was there any motion." Tedium is thus ever the same. "Time is hence the number of motion, according to priority and posteriority; it is not motion itself, unless so far as motion has number. We judge of the more or less through number, but of a greater or less motion by time. But we call number that which can be numbered, as well as that with which we number; but time is not the number with which we number, but that which is numbered, and, like motion, always is changing. The Now is, which is the unity of number, and it measures time. The whole of time is the same, for the Now which was is the same" (universality as the Now destroyed) "but in Being it is another. Time thus is through the Now both continuous (συνεχής) and discrete (διῄρηται). It thereby resembles the point, for that also is the continuity of the line and its division, its principle and limit; but the Now is not an enduring point. As continuity of time the Now connects

the past and the future, but it likewise divides time in capacity," the Now is only divisibility and the moments only ideal. "And in as far as it is such, it is always another; but, in as far as it unites, it is ever one and the same. Similarly, in as far as we divide the line, other and yet other points always arise for thought; but in as far as it is one, there is only one point. Thus the Now is both the division of time in capacity, and the limit and union of both" *i.e.* of the prior and posterior. The universally dividing point is only one as actual; but this actual is not permanently one, but ever and again another, so that individuality has universality, as its negativity, within it. "But division and union are the same, and similarly related; however their Notion (τὸ εἶναι)[95] is different." In one and the same respect the absolute opposite of what was posited is immediately set forth as existent; in space, on the other hand, the moments are not set forth as existent, but in it first appears this being and its motion and contradiction. Thus the identity of the understanding is not a principle with Aristotle, for identity and non-identity to him are one and the same. Because the Now is only now, past and future are different from it, but they are likewise necessarily connected in the Now, which is not without before and after; thus they are in one, and the Now, as their limit, is both their union and their division.

Aristotle (Phys. V. 1) then goes on to movement as realized in a thing, to change (μεταβολή) or to the physical processes — while before we had pure movement. "In movement there is first something which moves, also something which is moved, and the time in which it is moved; besides these, that from which, and that into which it is moved." (Cf. *supra*, p. 141.) "For all motion is from something and into something; but there is a difference between that which is first moved and that into which and from which it is moved, as, for instance, wood, warmth and cold. The motion is in the wood and not in the form; for neither form nor place, nor quantity

moves or is moved, but" (in the order in which they follow) "there is that which is moved and that which moves, and that into which it is moved. That to which movement is made, more than that out of which movement is made, is named change. Hence to pass into non-being is also change, although what passes away is changed from Being: and generation is a mutation into Being, even though it is from non-being." The remark is to be interpreted as meaning that for the first time in real becoming motion, *i.e.* in change, the relation *whereto* enters, while the relation *wherefrom* is that in which change is still the mere ideal motion. Besides this first form of difference between motion and change, Aristotle further gives another, since he divides change into three: "into change from a subject (ἐξ ὑποκειμένον) into a subject; or from a subject into a non-subject; or from a non-subject into a subject." The fourth, "from a non-subject into a non-subject," which may also appear in the general division, "is no mutation, for it contains no opposition." It may certainly be merely thought or ideal, but Aristotle indicates the actual phenomenon. "The mutation from a non-subject into a subject is generation (γένεσις); that from a subject into a non-subject is corruption (φθορά); that from a subject into a subject, is motion as such;" because that which is transformed remains the same, there is no becoming-another of the actual, but a merely formal becoming-another. This opposition of the materialized motion as mutation, and of merely formal motion, is noteworthy.

In the sixth book Aristotle comes to the consideration of the dialectic of this motion and change as advanced by Zeno, that is, to the endless divisibility which we have already (Vol. I. pp. 266-277) considered. Aristotle solves it through the universal. He says that they are the contradiction of the universal turned against itself; the unity in which its moments dissolve is not a nothing, so that motion and change are nothing,

but a negative universal, where the negative is itself again posited as positive, and that is the essence of divisibility.

Of the further details into which Aristotle enters, I shall only give the following. As against atoms and their motion, he remarks (Phys. VI. 10) that the indivisible has no motion and mutation, which is the direct opposite of the proposition of Zeno that only simple indivisible Being and no motion exists. For as Zeno argues from the indivisibility of atoms against motion, Aristotle argues from motion against atoms. “Everything which moves or changes is in the first division of this time partly here and partly there. The atom, as simple indivisible Being, can, however, not have any part of it in both points in space, because it then would be divisible. The indivisible could thus only move if time consisted of the Now; this is, however, impossible, as we proved before.” Because atoms thus neither have change in themselves, nor can this come to them from without through impulse, &c., they are really without truth.

The determination of the pure ideality of change is important. Aristotle says of this (Phys. VII. 3), “That which is changed is alone the sensuous and perceptible (αἰσθητόν); and forms and figures, as also capacities, are not changed, they arise and disappear in a thing only, without being themselves changed.” In other words: the content of change is unchangeable; change as such belongs to mere form. “Virtues or vices belong, for example, to habits acquired. Virtue is the perfection (τελείωσις) in which something has reached the end of its nature. Vice, however, is the corruption and non-attainment of this. They are not changes, for they only arise and pass away while another alters.” Or the difference becomes a difference of Being and non-being, *i.e.* a merely sensuous difference.

From these conceptions Aristotle now comes nearer to the first real or physical motion (Phys. VIII. 6, 8, 9; De C\nlo, I. 4): The first principle of motion is itself unmoved. An endless motion in a straight line is an empty

creation of thought; for motion is necessarily an effort after something. The absolute motion is the circular, because it is without opposition. For because movement has to be considered in regard to the starting-place and the end in view, in the straight movement the directions from A to B and from B to A are opposed, but in motion in a circle they are the same. The idea that heavenly bodies would of themselves have moved in a straight line, but that they accidentally came into the sphere of solar attraction, is an empty reflection which is far from occurring to Aristotle.

Aristotle then shows (De C\nlo, II. I; I. 3) that "the whole heavens neither arose nor can pass away, for they are one and eternal: they neither have beginning nor end in eternal time, for they contain infinite time shut up within them." All the other ideas are sensuous which try to speak of essential reality, and in them there always is that present which they think they have excluded. For when they assert a vacuum before the beginning of generation, this is the quiescent, self-identical, *i.e.* the eternal matter, which is thus already established before origination; they will not allow that before origination nothing exists. But in fact a thing does not exist before its origination, *i.e.* in movement there is something to move, and where reality is, there is motion. They do not, however, bring together that vacuum, the self-identical, the un-originated matter and this nothing. "That which has this absolute circular movement is neither heavy nor light; for the heavy is what moves downwards, and the light what moves upwards." In modern physics the heavenly bodies, on the other hand, are endowed with weight, and seek to rush into the sun, but cannot do so on account of another force. "It is indestructible and ungenerated, without decrease or increase, without any change. It is different from earth, fire, air and water; it is what the ancients called ether, as the highest place, from its continuous course (ἀεὶ θεῖν) in infinite time." This ether thus appears to be eternal matter which does not, however, take such a definite form, but which remains as it is, just

as the heavens do in our conception, although here the juxtaposition begins ever to strike us more forcibly.

Aristotle (De C\nlo, III. 6) shows further that the elements do not proceed from one body, but from one another; for in generation they neither proceed from what is incorporeal, nor from what is corporeal. In the first case they would have sprung from the vacuum, for the vacuum is the immediate incorporeal; but in that case the vacuum must have existed independently as that in which determinate corporeality arose. But neither do the elements arise from a corporeal, for else this body itself would be a corporeal element before the elements. Thus it only remains that the elements must spring from one another. Regarding this we must remark that Aristotle understands by origination, actual origination — not the transition from the universal to the individual, but the origination of one determinate corporeal, not from its principle, but from the opposite as such. Aristotle does not consider the universal as it contains the negative within it; else the universal would be the absolute matter whose universality, as negativity, is set forth, or is real.

From this point Aristotle comes (De C\nlo, IV. I-5) to a kind of deduction of the elements, which is noteworthy. He shows that there must be four of them, in the following way — because he starts from the fundamental conceptions of weight and of lightness, or what we should call attraction and centrifugal force. The corporeal, he says, in its motion is neither light nor heavy, and, indeed, it is not only relative but also absolute. The relatively light and heavy is what, while equal in volume, descends more slowly or quickly. Absolute lightness goes up to the extremity of the heavens, absolute weight down into the middle. These extremes are fire and earth. Between these there are mediums, other than they, which relate to one another like them; and these are air and water, the one of which has weight, and the other lightness, but only relatively. For water is suspended under

everything except earth, and air over everything except fire. “Hence,” Aristotle concludes, “there now are these four matters, but they are four in such a way that they have one in common; more particularly, because they arise out of one another, but exist as different.” Yet it is not the ether that Aristotle designates as this common matter. We must in this regard remark that however little these first determinations may be exhaustive, Aristotle is still far further on than the moderns, since he had not the conception of elements which prevails at the present time, according to which the element is made to subsist as simple. But any such simple determination of Being is an abstraction and has no reality, because such existence would be capable of no motion and change; the element must itself have reality, and it thus is, as the union of opposites, resolvable. Aristotle hence makes the elements, as we have already seen with those who went before (Vol. I., pp. 181, 182; 290-293; 336), arise out of one another and pass into one another; and this is entirely opposed to our Physics, which understands by elements an indelible, self-identical simplicity only. Hence men are wonderfully discerning in reproaching us for calling water, air, &c., elements! Nor yet in the expression “neutrality” have the modern physicists been able to grasp a universality conceived of as a unity, such as Aristotle ascribes to the elements; in fact, however, the acid which unites with a base is no longer, as is asserted, present within it as such. But however removed Aristotle may be from understanding simplicity as an abstraction, just as little does he recognize here the arid conception of consisting of parts. Quite the contrary. He strives enough against this, as, for instance, in relation to Anaxagoras (De C\nl. III. 4).

I shall further mention the moments of the real process in relation to motion, in which Aristotle finally passes on (De gen. et corr. II. 2-4) to the “principles of perceptible body”; we here see the elements in process, as formerly in their restful determinateness. Aristotle excludes the relations

which concern sight, smell, &c., and brings forward the others as being those which are of sensible weight or lightness. He gives as these fundamental principles — warmth and cold, dryness and moisture; they are the sensible differences for others, while weight and lightness are different for themselves. Now in order to prepare for the transition of the elements into sensible relations, Aristotle says: "Because there are those four principles, and four things have properly six relations to one another, but the opposite cannot here be connected (the moist cannot be connected with the dry, or the warm with the cold), there are four connections of these principles, warm and dry, warm and moist, cold and moist, cold and dry. And these connections follow those first elements, so that thus fire is warm and dry, air warm and moist (vapour), water cold and moist, earth cold and dry." From this Aristotle now makes the reciprocal transformation of the elements into one another comprehensible thus: Origination and decay proceed from the opposite and into the opposite. All elements have a mutual opposite; each is as non-being to the Being of the other, and one is thus distinguished from the other as actuality and capacity. Now amongst these some have an equal part in common; fire and water, for example, have warmth; thus if in fire dryness were overcome by moisture, out of fire air would arise. On the contrary, as regards those which have nothing in common with one another, like earth, which is cold and dry, and air, which is warm and moist, the transition goes more slowly forward. The transition of all elements into one another, the whole process of nature, is thus to Aristotle the constant rotation of their changes. This is unsatisfactory, because neither are the individual elements comprehended nor is the remainder rounded into a whole.

As a matter of fact, Aristotle now goes on, in meteorology, to the consideration of the universal process of nature. But here we have reached his limits. Here, in the natural process, the simple determination as such —

this system of progressive determination — ceases to hold good, and its whole interest is lost. For it is in the real process that these determinate conceptions always lose their signification again and become their opposite, and in it also this contingent succession is forced together and united. In determining time and motion, we certainly saw Aristotle himself uniting opposite determinations; but movement, in its true determination, must take space and time back into itself; it must represent itself as being the unity of these its real moments and in them; that is, as the realization of this ideal. But still more must the following moments, moisture, warmth, &c., themselves come back under the conception of process. But the sensuous manifestation here begins to obtain the upper hand; for the empirical has the nature of the isolated form, which is to fall out of relation. The empirical manifestation thus outstrips thought, which merely continues everywhere to stamp it as its own, but which has no longer power to permeate the manifestation, since it withdraws out of the sphere of the ideal, while it is still in the region of time, space and movement.

3. The Philosophy of Mind.

As regards the other side from the Philosophy of Nature, the Philosophy of Mind, we find that Aristotle has constituted in it also a separation into special sciences, in a series of works which I shall name. In the first place, his three books "On the Soul" deal partly with the abstract universal nature of the soul, though mainly in an antagonistic spirit; and even more, and in a fashion both profound and speculative, they deal with the soul's essential nature — not with its Being, but with the determinate manner and potentiality of its energy; for this is to Aristotle the Being and essence of the soul. Thus there are several different treatises, viz.: On Sense-perception and the Sensible, On Memory and Recollection, On Sleeping and Waking,

On Dreams, On Divination (μαντική) through Dreams, besides a treatise on Physiognomy; there is no empirical point of view or phenomenon, either in the natural or the spiritual world, that Aristotle has considered beneath his notice. With respect to the practical side, he in like manner devotes his attention to man in his capacity of householder, in a work on economics (οἰκονομικά); then he takes into his consideration the individual human being, in a moral treatise (ἠθικά), which is partly an inquiry into the highest good or the absolute end, and partly a dissertation on special virtues. The manner of treatment is almost invariably speculative, and sound understanding is displayed throughout. Finally, in his Politics, he gives a representation of the true constitution of a state and the different kinds of constitution, which he deals with from the empirical point of view; and in his Politics an account is given of the most important states, of which we are, however, told very little.

a. Psychology.

In Aristotle's teaching on this subject we must not expect to find so-called metaphysics of the soul. For metaphysical handling such as this really presupposes the soul as a thing, and asks, for example, what sort of a thing it is, whether it is simple, and so on. Aristotle did not busy his concrete, speculative mind with abstract questions such as these, but, as already remarked, he deals rather with the manner of the soul's activity; and though this appears in a general way as a series of progressive determinations which are not necessarily blended into a whole, each determination is yet apprehended in its own sphere with as much correctness as depth.

Aristotle (De Anima, I. 1) makes in the first place the general remark that it appears as if the soul must, on the one hand, be regarded in its freedom as independent and as separable from the body, since in thinking it is independent; and, on the other hand, since in the emotions it appears to be

united with the body and not separate, it must also be looked on as being inseparable from it; for the emotions show themselves as materialized Notions (λόγοι ἔνυλοι), as material modes of what is spiritual. With this a twofold method of considering the soul, also known to Aristotle, comes into play, namely the purely rational or logical view, on the one hand, and, on the other hand, the physical or physiological; these we still see practised side by side. According to the one view, anger, for instance, is looked on as an eager desire for retaliation or the like; according to the other view it is the surging upward of the heart-blood and the warm element in man. The former is the rational, the latter the material view of anger; just as one man may define a house as a shelter against wind, rain, and other destructive agencies, while another defines it as consisting of wood and stone; that is to say, the former gives the determination and the form, or the purpose of the thing, while the latter specifies the material it is made of, and its necessary conditions.

Aristotle characterizes the nature of the soul more closely (De Anima, II. 1) by referring to the three moments of existence: "First there is matter (ὕλη), which is in itself no individual thing; secondly, the form and the universal (μορφὴ καὶ εἶδος), which give a thing individuality; thirdly, the result produced by both, in which matter is potentiality and form is energy (ἐντελέχεια);" matter thus does not exist as matter, but only implicitly. "The soul is substance, as being the form of the physical organic body which is possessed potentially of life; but its substance is energy (ἐντελέχεια), the energy of a body such as has been described" (endowed with life). "This energy appears in twofold form: either as knowledge (ἐπιστήμη) or as active observation (τὸ θεωρεῖν). But it is evident that here it is to be regarded as the former of these. For the soul is present with us both when we sleep and when we wake; waking corresponds with active observation, and sleep with possession and passivity. But knowledge is in origination prior to all else.

The soul is thus the first energy of a physical but organic body.” It is in respect of this that Aristotle gives to the soul the definition of being the entelechy (*supra*, pp. 143, 144).

In the same chapter Aristotle comes to the question of the mutual relation of body and soul. “For this reason” (because soul is form) “we must no more ask if soul and body are one than we ask if wax and its form are one, or, in general, if matter and its forms are one. For though unity and Being are used in various senses. Being is essentially energy.” Were we, namely, to pronounce body and soul one in the same way that a house, which consists of a number of parts, or as a thing and its properties, or the subject and predicate, and so on, are called one, where both are regarded as things, materialism results. An identity such as this is an altogether abstract, and therefore a superficial and empty determination, and a term which it is a mistake to employ, for form and material do not rank equally as regards Being; identity truly worthy of the name is to be apprehended as nothing else than energy such as has been described. The only question that now arises is whether activity and the organ it employs are one; and our idea is to answer in the affirmative. The more definite explanation of this relation is to be found in the following; “The soul is substance, but only according to the Notion (κατὰ τὸν λόγον); but that is the substantial form (τὸ τί ἦν εἶναι)[96] for such and such a body. For suppose that an instrument, such as an axe, were a natural body, this form, this axehood, would be its substance, and this its form would be its soul, for if this were to be taken away from it, it would no longer be an axe, the name only would remain. But soul is not the substantial form and Notion of such a body as an axe, but of a body which has within itself the principle of movement and of rest.” The axe has not the principle of its form in itself, it does not make itself an axe, nor does its form, its Notion, in itself constitute its substance, as its activity is not through itself. “If, for instance, the eye were in itself a living thing, vision

would be its soul, for vision is the reality which expresses the Notion of the eye. But the eye, as such, is only the material instrument of vision, for if vision were lost, the eye would be an eye only in name, like an eye of stone or a painted eye.” Thus to the question, What is the substance of the eye? Aristotle answers: Are the nerves, humours, tissues, its substance? On the contrary, sight itself is its substance, these material substances are only an empty name. “As this is the case in the part, so it also holds good of the body as a whole. The potentiality of life is not in any such thing as has lost its soul, but in that which still possesses it. The seed or the fruit is such and such a body potentially. Like hewing and seeing,” in the axe and the eye, “waking” in general “is activity; but the corporeal is only potentiality. But as the” living “eye is both vision and the eyeball” (the two being connected as actuality and potentiality), “so also are soul and body the living animal, the two are not to be separated. But it is not yet clear whether the soul is the activity of the body in the same way as the steersman is of the ship.” That the active form is the true substance, while matter is so only potentially, is a true speculative Notion.

As settling the question asked in the above-mentioned metaphor, we may quote what Aristotle says later (De Anima, II. 4): “As the principle of motion and as end (οὗ ἕνεκα), and as substance of living bodies, the soul is the cause. For substance is to all objects the cause of their existence, but life is the existence of the living, and its cause and principle is the soul; and further, its energy is the existing Notion of what has potential existence. The soul is cause also as end,” that is, as self-determining universality, “for nature, like thought, acts for the sake of an object, which object is its end, but in living beings this is soul. All the parts of the body are thus the organs of the soul, and hence exist for its sake.” In like manner Aristotle shows that the soul is the cause of motion.

Aristotle (De Anima, II. 2, 3) further states that the soul is to be determined in three ways, namely as nutrient or vegetable, as sensitive, and as intelligent, corresponding with plant life, animal life and human life. The nutrient soul, when it is alone, belongs to plants; when it is at the same time capable of sense-perception, it is the animal soul; and when at once nutrient, sensitive and intelligent, it is the mind of man. Man has thus three natures united in himself; a thought which is also expressed in modern Natural Philosophy by saying that a man is also both an animal and a plant, and which is directed against the division and separation of the differences in these forms. That difference has also been revived in recent times in the observation of the organic, and it is highly important to keep these sides separate. The only question (and it is Aristotle who raises it) is how far these, as parts, are separable. As to what concerns more nearly the relation of the three souls, as they may be termed (though they are incorrectly thus distinguished), Aristotle says of them, with perfect truth, that we need look for no one soul in which all these are found, and which in a definite and simple form is conformable with any one of them. This is a profound observation, by means of which truly speculative thought marks itself out from the thought which is merely logical and formal. Similarly among figures only the triangle and the other definite figures, like the square, the parallelogram, &c., are truly anything; for what is common to them, the universal figure, is an empty thing of thought, a mere abstraction. On the other hand, the triangle is the first, the truly universal figure, which appears also in the square, &c., as the figure which can be led back to the simplest determination. Therefore, on the one hand, the triangle stands alongside of the square, pentagon, &c., as a particular figure, but — and this is Aristotle's main contention — it is the truly universal figure. In the same way the soul must not be sought for as an abstraction, for in the animate being the nutritive and the sensitive soul are included in the intelligent, but

only as its object or its potentiality; similarly, the nutritive soul, which constitutes the nature of plants, is also present in the sensitive soul, but likewise only as being implicit in it, or as the universal. Or the lower soul inheres only in the higher, as a predicate in a subject: and this mere ideal is not to be ranked very high, as is indeed the case in formal thought; that which is for itself is, on the contrary, the never-ceasing return into itself, to which actuality belongs. We can determine these expressions even more particularly. For if we speak of soul and body, we term the corporeal the objective and the soul the subjective; and the misfortune of nature is just this, that it is objective, that is, it is the Notion only implicitly, and not explicitly. In the natural there is, no doubt, a certain activity, but again this whole sphere is only the objective, the implicit element in one higher. As, moreover, the implicit in its sphere appears as a reality for the development of the Idea, it has two sides; the universal is already itself an actual, as, for example, the vegetative soul. Aristotle's meaning is therefore this: an empty universal is that which does not itself exist, or is not itself species. All that is universal is in fact real, as particular, individual, existing for another. But that universal is real, in that by itself, without further change, it constitutes its first species, and when further developed it belongs, not to this, but to a higher stage. These are the general determinations which are of the greatest importance, and which, if developed, would lead to all true views of the organic, &c., since they give a correct general representation of the principle of realization.

α. The nutritive or vegetative soul is therefore, according to Aristotle (De Anima, II. 4), to be conceived as the first, which is energy, the general Notion of the soul itself, just as it is, without further determination; or, as we should say, plant life is the Notion of the organic. What Aristotle goes on to say of nourishment, for instance, whether the like is nourished by the like, or by the opposite, is of little importance. It may, however, be

mentioned that Aristotle (De Anima, II. 12) says of the vegetative soul that it is related only to matter, and that only after a material manner, as when we eat and drink, but that it cannot take up into itself the forms of sensible things: we, too, ourselves in practical matters are related as particular individuals to a material existence here and now, in which our own material existence comes into activity.

β. There is more to interest us in Aristotle's determination of sense-perception (De Anima, II. 5), as to which I shall make some further quotations. Sense-perception is in general a potentiality (we should say a receptivity), but this potentiality is also activity; it is therefore not to be conceived as mere passivity. Passivity and activity pertain to one and the same, or passivity has two senses. "On the one hand a passivity is the destruction of one state by its opposite; on the other hand, it is a preservation of what is merely potential by means of what is actual." The one case occurs in the acquisition of knowledge, which is a passivity in so far as a change takes place from one condition (ἕξις) into an opposite condition; but there is another passivity, in which something only potentially posited is maintained, therefore knowledge is knowing in an active sense (*supra*, p. 182). From this Aristotle concludes: "There is one change which is privative; and another which acts on the nature and the permanent energy (ἕξις). The first change in the subject of perception (αἰσθητικοῦ) is caused by that which produces the perception; but, once produced, the perception is possessed as knowledge (επιστήμη)." Because that which produces the change is different from the result, perception is passivity; but it is just as much spontaneity, "and sense-perception, like knowledge (θεωρεῖν), has to do with this aspect of activity. But the difference is, that what causes the perception is external. The cause of this is that perceptive activity is directed on the particular, while knowledge has as its object the universal; but the universal is, to a certain extent, in the soul

itself as its substance. Everyone can therefore think when he will," and for this very reason thought is free, "but perception does not depend on him, having the necessary condition that the object perceived be present." The influence from without, as a passivity, comes therefore first; but there follows the activity of making this passive content one's own. This is doubtless the correct point from which to view perception, whatever be the manner of further development preferred, subjective idealism, or any other way. For it is a matter of perfect indifference whether we find ourselves subjectively or objectively determined; in both there is contained the moment of passivity, by which the perception comes to pass. The monad of Leibnitz appears, it is true, to be an idea opposed to this, since every monad, every point of my finger, as atom or individual, is an entire universe, the whole of which develops in itself without reference to other monads. Here seems to be asserted the highest idealistic freedom, but it is of no avail to imagine that all in me develops out of me; for we must always recollect that what is thus developed in me is passive, and not free. With this moment of passivity Aristotle does not fall short of idealism; sensation is always in one aspect passive. That is, however, a false idealism which thinks that the passivity and spontaneity of the mind depend on whether the determination given is from within or from without, as if there were freedom in sense-perception, whereas it is itself a sphere of limitation. It is one thing when the matter — whether it be sensation, light, colour, seeing or hearing — is apprehended from the Idea, for it is then shown that it comes to pass from the self-determination of the Idea. But it is different when, in so far as I exist as an individual subject, the Idea exists in me as this particular individual; there we have the standpoint of finitude established, and therefore of passivity. Thus there need be no standing on ceremony with sense-perception, nor can a system of idealism be based on the theory that nothing comes to us from without: as Fichte's theory about himself was,

that when he put on his coat, he constituted it in part by drawing it on, or even by looking at it. The individual element in sensation is the sphere of the individuality of consciousness; it is present therein in the form of one thing as much as of another, and its individuality consists in this fact, that other things exist for it. Aristotle continues: “Speaking generally, the difference is that potentiality is twofold; as we say a boy may become a general, and a grown man may also become so,” for the latter has the effective power. “This is the nature of the faculty of sense-perception (αἰσθητικόν); it is in potentiality what the object of sense (αἰσθητόν) is in actuality. Sense-perception is therefore passive, in so far as it does not resemble its object, but after the impression has been made it becomes similar to its object, and is identified with it.” The reaction of sense-perception consists therefore in this active receiving into itself of that which is perceived; but this is simply activity in passivity, the spontaneity which abrogates the receptivity in sense-perception. Sense-perception, as made like to itself, has, while appearing to be brought to pass by means of an influence working on it, brought to pass the identity of itself and its object. If then subjective idealism declares that there are no external things, that they are but a determination of our self, this must be admitted in respect to pure sense-perception, since sense-perception is a subjective existence or state in me, which yet, however, is not for that reason freedom.

In speaking of sense-perception, Aristotle (De Anima, II. 12) makes use of his celebrated simile, which has so often occasioned misapprehension, because it has been understood quite incorrectly. His words are: “Sense-perception is the receiving of sensible forms without matter, as wax receives only the impress of the golden signet ring, not the gold itself, but merely its form.” For the form is the object as universal; and theoretically we are in the position, not of the individual and sensuous, but of the universal. The case is different with us in our practical relations, where the

influence working upon us pre-supposes in return the contact of the material, for which reason, as Aristotle asserts, plants do not perceive (*supra*, p. 186). On the other hand, in receiving form, the material is lost sight of; for the receiving of form indicates no positive relation to the matter, which is no longer something offering resistance. If, therefore, sense-perceptions are termed in general sensuous impressions, we, in matter-of-fact fashion, do not get beyond this crude way of putting it; and in making the transition to soul, we take refuge behind popular conceptions, which are partly ill-defined Notions, and partly not Notions at all. Thus it is said that all sense-perceptions are impressed on the soul by external things, just as the matter of the signet ring works on the matter of the wax; and then we hear it alleged that this is Aristotle's philosophy. It is the same with most other philosophers; if they give any sort of illustration that appeals to the senses, everyone can understand it, and everyone takes the content of the comparison in its full extent: as if all that is contained in this sensuous relationship should also hold good of the spiritual. No great importance is therefore to be attached to this conception, as it is only an illustration, professing to show by a side comparison that the passive element in sense-perception is in its passivity for pure form only; this form alone is taken up into the percipient subject, and finds a place in the soul. It does not, however, remain in the same relation to it as that in which the form stands to the wax, nor is it as in chemistry where one element is permeated by another as regards its matter. The chief circumstance, therefore, and that which constitutes the difference between this illustration and the condition of the soul is altogether overlooked. That is to say, the wax does not, indeed, take in the form, for the impression remains on it as external figure and contour, without being a form of its real Being; if it were to become such, it would cease to be wax; therefore, because in the illustration there is lacking this reception of form into the Being, no thought is given to it. The

soul, on the contrary, assimilates this form into its own substance, and for the very reason, that the soul is in itself, to a certain extent, the sum of all that is perceived by the senses (*infra*, p. 198): as it was said above (p. 183), if the axe had its form in the determination of substance, this form would be the soul of the axe. The illustration of the wax has reference to nothing but the fact that only the form comes to the soul; and has nothing to do with the form being external to the wax and remaining so, or with the soul having, like wax, no independent form. The soul is by no means said to be passive wax and to receive its determinations from without; but Aristotle, as we shall soon see (p. 194), really says that the spirit repels matter from itself, and maintains itself against it, having relation only to form. In sense-perception the soul is certainly passive, but the manner in which it receives is not like that of the wax, being just as truly activity of the soul; for after the perceptive faculty has received the impression, it abrogates the passivity, and remains thenceforth free from it (*supra*, p. 187). The soul therefore changes the form of the external body into its own, and is identical with an abstract quality such as this, for the sole reason that it itself is this universal form.

This description of sense-perception Aristotle explains more fully in what follows (De Anima, III. 2), and expatiates upon this unity and its contrasts, in the course of which explanation there appear many clear and far-reaching glimpses into the Nature of consciousness. “The bodily organ of each sense-perception receives the object perceived without matter. Hence, when the object of sense is removed, the perceptions and the images which represent them remain in the organs. In the act of sense-perception the object perceived is no doubt identical with the subject that perceives, but they do not exist[97] as the same; for instance, sound and the hearing are the same when in active exercise, but that which has hearing does not always hear, and that which has sound is not always sounding. When that

which is the potentiality of hearing comes into exercise, and likewise that which is the potentiality of sound, hearing and sound, being in full activity, coincide," they do not remain separate energies. "If then movement and action, as well as passivity, have a place in the object on which activity is exercised (ἐν τῷ ποιουμένῳ), it follows necessarily that the energy of hearing and sound is contained in that which potentially is hearing, for the energy of the active and moving is in the passive. As therefore activity and passivity are manifested in the subject which receives the effect, and not in the object which produces it (ποιοῦντι), the energy both of the object and of the faculty of sense-perception is in the faculty itself. For hearing and sounding there are two words, for seeing only one; seeing is the activity of the person who sees, but the activity of the colour is without name. Since the energy of that which is perceived and that which perceives is one energy, and the aspect they present is alone different, the so-called sounding and hearing must cease simultaneously." There is a body which sounds and a subject which hears; they are twofold in the aspect they present, but hearing, taken by itself, is intrinsically an activity of both. In like manner, when I have by sense the perception of redness and hardness, my perception is itself red and hard: that is, I find myself determined in that way, even though reflection says that outside of me there is a red, hard thing, and that it and my finger are two; but they are also one, my eye is red and the thing. It is upon this difference and this identity that everything depends; and Aristotle demonstrates this in the most emphatic way, and holds firmly to his point. The later distinction of subjective and objective is the reflection of consciousness; sense-perception is simply the abrogation of this separation, it is that form of identity which abstracts from subjectivity and objectivity. What is simple, the soul proper or the I, is in sense-perception unity in difference. "Further, every sense-perception is in its organ, and distinguishes everything that is perceived, like black and white, and so on.

It is thus not possible for separate perceptions, white and sweet, to be distinguished as separate indifferent moments, for both must be present (δῆλα) to one subject. This one subject must therefore determine one thing to be different from another. This, as distinguished, can also not be in a different place or time, for it must be undivided and in undivided time. But it is impossible that one and the same thing should be affected by contrary movements, in so far as it is undivided and in undivided time. If sweetness affects sense-perception in one way, and bitterness in the contrary way, and whiteness in yet another way, the power of judging is numerically not discrete nor divisible, but according to the Notion (τῷ εἶναι)[98] it is distinguished. That which is the same and indivisible thus possesses in potentiality opposite qualities; but with its true existence (τῷ εἶναι) that cannot be the case, for in its activity it is separable, and cannot at the same time be both white and black. Sense-perception and thinking are like that which some term a point, which, in so far as it is one, is inseparable, and in so far as it is two, is separable. So far as it is undivided, the judging faculty is one and acts in a single point of time, but so far as it is divided" (not one) "it employs the same sign twice simultaneously. So far as it employs two, it by limitation distinguishes two, and separates them as having separate origin; but so far as it is one, it judges by one act in one single point of time" (*supra*, p. 172). For as the point in time, which resembles the point in space, contains future and past, and thus is something different and at the same time one and the same, since it is in one and the same respect separation and union; sense-perception is also one and at the same time separation, separated and not separated, seeing that the faculty of perception has before it in one unity the distinct sense-perception, which by this means receives for the first time a determinate content. Another example is that of number; one and two are different, and, at the same time, even in two one is used and posited as one.

γ. From sense-perception Aristotle passes on to thought, and becomes here really speculative. "Thinking," he says (De Anima, III. 4) "is not passive (ἀπαθές), but receptive of the form, and is in potentiality similar to it. Therefore the understanding (νοῦς), because it thinks all things, is free from all admixture (ἀμιγής), in order that it may overcome (κρατῇ), as Anaxagoras says, that is, in order that it may acquire knowledge; for, coming forth in its energy (παρεμφαινόμενον), it holds back what is alien to it, and fortifies itself against it (ἀντιφράττει). Therefore the nature of the understanding is none other than this potentiality." But potentiality itself is here not matter; that is to say, the understanding has no matter, for potentiality pertains to its very substance. For thinking is really the not being implicit; and on account of its purity its reality is not the being-for-another, but its potentiality is itself a being-for-self. A thing is real because it is this determinate thing; the opposite determination, its potentiality to be, for instance, smoke, ashes, and so on, is not posited in it. In the corporeal, therefore, matter, as potentiality, and external form, as reality, are opposed to one another; but the soul is, in contrast with this, universal potentiality itself, without matter, because its essence is energy. "Understanding, then, in the soul, as that which possesses consciousness, is nothing in reality before it thinks;" it is absolute activity, but exists only when it is active. "It is therefore not incorporated with the body. For what should it be like, warm or cold? Or should it be an organ? But it is none of these. That it is, however, different from the faculty of sense-perception is clear. For sense-perception cannot perceive after a violent perception; for instance, it cannot smell nor see after experiencing strong smells or colours. But the understanding, after it has thought something which can only be thought with difficulty, will not have more but less difficulty in thinking of something that is easier. For there is no sense-perception independent of the body, but the understanding is separable from it. When it has then become

something individual, like him who is really possessed of a faculty of knowing (and this happens when he can energize through himself), it then is also in a certain degree according to potentiality, but yet not so in the same manner as it was before learning and finding.” (*Cf. supra*, pp. 182, 187.)

Thinking makes itself into passive understanding, that is, into what is for it the objective; and thus it here becomes plain to what extent the dictum *nihil est in intellectu quod non fuerit in sensu* expresses Aristotle’s meaning. Aristotle, raising difficulties, goes on to ask, “If reason is simple and unaffected by impressions, and has nothing in common with other objects, how can it think, since thinking is certainly a state of receptivity?” That is to say, in thinking there is a reference to an object distinct from itself. “For it is when two objects have something in common that the one appears to produce and the other to receive an impression. There is a further difficulty, whether understanding can itself be the object of thought. In that case understanding would either be inherent in other things — unless it is the object of thought in a different sense from that in which other things are so, but there is only one sense in which things can be objects of thought — or, on the other hand, it would have something compounded with it, making it an object of thought as other things are. Now it has been already said that passivity is so determined that understanding is in potentiality all that thought is exercised on: but at the same time it is in actuality nothing before the exercise of thought.” That is to say, thought is implicitly the content of the object of what is thought, and in coming into existence it only coincides with itself; but the self-conscious understanding is not merely implicit, but essentially explicit, since it is within itself all things. That is an idealistic way of expressing it; and yet they say that Aristotle is an empiricist.

The passivity of understanding has therefore here only the sense of potentiality before actuality, and that is the great principle of Aristotle; in regard to this he brings forward at the end of the same chapter another

much-decried illustration, which has been just as much misunderstood as the preceding. “Reason is like a book upon whose pages nothing is actually written;” that is, however, paper, but not a book. All Aristotle’s thoughts are overlooked, and only external illustrations such as this are comprehended. A book on which nothing is written everyone can understand. And the technical term is the well-known *tabula rasa*, which is to be found wherever Aristotle is spoken of: Aristotle is said to have alleged that the mind is a blank page, on which characters are first traced by external objects, so that thinking thus comes to it from without.[99] But that is the very opposite of what Aristotle says. Instead of the Notion being adhered to, casual comparisons such as these have been caught up here and there by the imagination, as if they expressed the matter itself. But Aristotle did not in the least intend that the analogy should be pushed to its furthest extent: the understanding is of a surety not a thing, and has not the passivity of a writing-tablet; it is itself the energy, which is not, as it would be in the case of a tablet, external to it. The analogy is therefore confined to this, that the soul has a content only in so far as actual thought is exercised. The soul is this book unwritten on, and the meaning consequently is that the soul is all things implicitly, but it is not in itself this totality; it is like a book that contains all things potentially, but in reality contains nothing before it is written on. Before real activity nothing truly exists; or “Understanding itself can enter thought, like the objects of thought in general. For in that which is without matter” (in mind), “the thinker” (the subjective) “and the thought” (the objective) “are the same; theoretical knowledge and that which comes to be known are the same. In that which is material, thinking is only in potentiality, so that understanding itself does not belong to it; for understanding is a potentiality without matter, but the object of thought exists in it,” while Nature contains the Idea only implicitly. It is plain from

this that the above illustration has been taken in quite a false sense, utterly contrary to Aristotle’s meaning.

Until now we have spoken of the passive understanding, which is the nature of the soul, but also in equal degree its faculty of sense-perception and imagination. Aristotle now proceeds to distinguish active understanding from this, as follows (De Anima, III. 5): “In nature as a whole there is present in every species of things, on the one hand, matter, which in potentiality is the whole of this species, and, on the other hand, cause and energy, operative in all things, in the same way that art is related to matter. It therefore necessarily follows that in the soul also these different elements should be present. The faculty of understanding is thus, in one view of it, the capacity of becoming all things; but in another view it is the capacity of creating all things, as is done by an efficient power (ἕξις), light, for instance, which first causes the colours which exist in potentiality to exist in reality. This understanding is absolute (χωριστός), uncompounded, and not influenced from without, as it is essentially activity. For the active is always more in honour than the passive, and the principle more in honour than the matter that it forms. Knowledge, when in active exercise, is identical with the thing (πρᾶγμα) known; but what is in potentiality” (that is, external reason, imagination, sense-perception) “is certainly prior in respect of time in one and the same individual, but in the universal (ὅλως) it is not even so in respect of time. Active understanding is not such that it sometimes thinks and sometimes does not. When it is absolute, it is the one and only existence; and this alone is eternal and immortal. We, however, do not remember this process, because this understanding is unaffected from without; but the passive understanding is transitory, and without the former it is incapable of thought.”

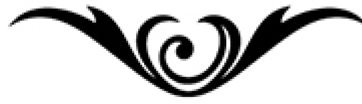
The seventh and eighth chapters are expositions of the maxims contained in the fourth and fifth; they begin with these maxims, and have the

appearance of being from the hand of a commentator. “The soul,” says Aristotle (De Anima, III. 8), “is in a certain sense the whole of existence. For existent objects are either perceived by the senses or thought; but knowledge itself is in a manner the object of knowledge, and perception the object of perception. What are known and perceived are either the things themselves or their forms. Knowledge and sense-perception are not the things themselves (the stone is not in the soul), but their form; so that the soul is like the hand. As this is the instrument by which we grasp instruments, so the understanding is the form by which we apprehend forms, and sense-perception the form of the objects cf sense.” Before this Aristotle had remarked (De Anima, III. 4): “It has been truly said that the soul is the *place of ideas* (τόπος εἰδῶν): not the whole soul, but only the thinking soul, and these ideas do not exist in the soul actually, but only potentially.” That is to say, the ideas are at first only quiescent forms, not activities, and so Aristotle is not a realist. But the understanding makes these forms, like those of external nature, its objects, its thoughts, its potentiality, Aristotle therefore says in the seventh chapter: “The understanding thinks the abstract (τὰ ἐν ἀφαιρέσει λεγόμενα), just as it conceives snubnosedness not as snubnosedness that cannot be separated from the flesh, but as hollowness.” Then in the eighth chapter Aristotle goes on to say: “But as no object is separated from its perceived dimensions, so in the forms perceived by sense there are also objects of thought, both abstract conceptions and the qualities (ἕξεις) and determinations of the objects of sense. In this way he who perceives nothing by his senses learns nothing and understands nothing; when he discerns anything (θεωρῇ), he must necessarily discern it as a pictorial conception, for such conceptions are like sense-perceptions, only without matter. In what way then are our primary ideas distinguished, so as not to be mistaken for conceptions? Or is it not the case also that other thoughts even are not pictorial conceptions,

but only that they are never found unassociated with such conceptions?" Since what follows contains no answer to the questions raised here at the very end, this would seem an additional indication that these portions follow later.[100] Aristotle concludes the seventh chapter with the words: "Speaking generally, the understanding is the faculty which thinks things in their real activity. Whether, however, it can think the absolute or not, unless it be itself separated from the sensuous, we shall inquire later (ὕστερον)." This "later" Buhle considers to have reference to the "highest philosophy."[101]

This identity of the subjective and objective, which is present in the active understanding — while finite things and mental states are respectively one separated from the other, because there the understanding is only in potentiality — is the highest point which speculation can reach: and in it Aristotle reverts to his metaphysical principles (p. 147), where he termed self-thinking reason absolute Thought, divine Understanding, or Mind in its absolute character. It is only in appearance that thought is spoken of as on a level with what is other than thought; this fashion of bringing what is different into conjunction certainly appears in Aristotle. But what he says of thought is explicitly and absolutely speculative, and is not on the same level with anything else, such as sense-perception, which has only potentiality for thought. This fact is moreover involved, that reason is implicitly the true totality, but in that case thought is in truth the activity which is independent and absolute existence; that is, the thought of Thought, which is determined thus abstractly, but which constitutes the nature of absolute mind explicitly. These are the main points which are to be taken note of in Aristotle with regard to his speculative ideas, which it is impossible for us, however, to treat in greater detail.

We have now to pass on to what follows, which is a practical philosophy, and in doing so we must first establish firmly the conception of desire,



which is really the turning round of thought into its negative side, wherein it becomes practical. Aristotle (De Anima, III. 7 and 6) says: “The object of knowledge and active knowledge are one and the same; what is in potentiality is in the individual prior in point of time, although not so in itself. For all that comes into being originates from that which operates actively. The object perceived by sense appears as that which causes the faculty of perception in potentiality to become the faculty of perception in actuality, for the latter is not receptive of influence, and does not undergo change. On that account it has a different kind of movement from the ordinary, for movement, as we have seen (p. 163) is the activity of an unaccomplished end (ἐνέργεια ἀτελοῦς); pure activity (ἁπλῶς ἐνέργεια), on the contrary, is that of the accomplished end (τοῦ τετελεσμένον).”— “The simple thoughts of the soul are such that in regard to them there can be no falsity; but that in which there is falsity or truth is a combination of thoughts as constituting one conception; for example, ‘the diameter is incommensurate.’ Or if by mistake white has been stated to be not white, not-white has been brought into connection with it. All this process may, however, just as well be termed separation. But that which makes everything one is reason, which in the form of its thinking thinks the undivided in undivided time and with the undivided action of the soul.”— “Sense-perception resembles simple assertion and thought, but pleasant or unpleasant sense-perception has the relation of affirmation or negation,” therefore of the positive and negative determination of thought. “And to perceive the pleasant or unpleasant is to employ the activity” (spontaneity) “of the middle state of sense-perception upon good or evil, in so far as they are such. But desire and aversion are the same in energy; it is only in manifestation that they are different. To the reasoning soul pictorial conceptions take the place of sense-perceptions, and when the mind affirms or denies something to be good or bad, it desires or avoids its object. It has

the relation both of unity and limit. The understanding," as that which determines opposites, "recognizes the forms underlying pictorial conceptions; and in the same manner as what is desirable in them and what is to be avoided have been determined for it, so it also is determined independently of actual sense-perceptions when it is in mental conceptions. And when, in dealing with conception or thought, as if seeing them, it compares the future with the present and passes judgment accordingly, and determines what is pleasant or unpleasant in this respect; it desires or seeks to avoid it, and in general it finds itself in practical operation. But independently of action true and false are of the same character as good or evil."

b. Practical Philosophy.

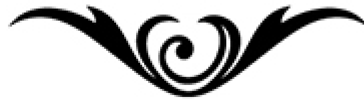
From this the conception of will, or the practical element is shown to us, and it has to be reckoned as still belonging to the Philosophy of Mind. Aristotle has treated it in several works which we now possess.

α. Ethics.

We have three great ethical works: the Nicomachean Ethics (Ἠθικὰ Νικομάχεια) in ten books, the Magna Moralia (Ἠθικὰ μεγάλα) in two books, and the Eudemean Ethics (Ἠθικὰ Εὐδήμια) in seven books; the last deals for the most part with particular virtues, while in the first two general investigations on the principles are contained. Just as the best that we even now possess in reference to psychology is what we have obtained from Aristotle, so is it with his reflections on the actual agent in volition, on freedom, and the further determinations of imputation, intention, &c. We must simply give ourselves the trouble to understand these, and to translate them into our own form of speech, conception and thought; and this is certainly difficult. Aristotle follows the same course here as in his Physics, determining one after the other, in the most thorough and accurate fashion, the many moments which appear in desire: the purpose, the decision, voluntary or forced action, the act of ignorance, guilt, moral responsibility, &c. I cannot enter upon this somewhat psychological presentation of the subject.[102] I shall only make the following remarks on the Aristotelian definitions.

Aristotle[103] defines the principle of morality or the highest good, as happiness (εὐδαιμονία), which later on became a much disputed expression. It is good generally, not as abstract idea, but in such a way that the moment of realization is what actually answers to it. Aristotle thus does not content himself with the Platonic idea of the good, because it is only general; with him the question is taken in its determinateness. Aristotle then says that the good is what has its end in itself (τέλειον). If we tried to translate τέλειον by "perfect" here, we should translate it badly; it is that which, as having its

end (τὸ τέλος) in itself, is not desired for the sake of anything else, but for its own sake (*supra*, pp. 162, 201). Aristotle determines happiness in this regard as the absolute end existing in and for itself, and gives the following definition of it: It is “the energy of the life that has its end in itself in accordance with absolute virtue (ζωῆς τελείας ἐνέργεια κατ᾽ ἀρετὴν).” He makes rational insight an essential condition; all action arising from sensuous desires, or from lack of freedom generally, indicates lack of insight; it is an irrational action, or an action which does not proceed from thought as such. But the absolute rational activity is alone knowledge, the action which in itself satisfies itself, and this is hence divine happiness; with the other virtues, on the contrary, only human happiness is obtained, just as from a theoretic point of view feeling is finite as compared with divine thought. Aristotle goes on to say much that is good and beautiful about virtue and the good and happiness in general, and states that happiness, as the good attainable by us, is not to be found without virtue, &c.; in all of which there is no profound insight from a speculative point of view.



In regard to the conception of virtue I should like to say something more. From a practical point of view, Aristotle[104] first of all distinguishes in soul a rational and an irrational side; in the latter reason only exists potentially; under it come the feelings, passions and affections. On the rational side understanding, wisdom, discretion, knowledge, have their place; but they still do not constitute virtue, which first subsists in the unity of the rational and the irrational sides. When the inclinations are so related to virtue that they carry out its dictates, this, according to Aristotle, is virtue. When the perception is either bad or altogether lacking, but the heart is good, goodwill may be there, but not virtue, because the principle — that is reason — which is essential to virtue, is wanting. Aristotle thus places virtue in knowledge, yet reason is not, as many believe, the principle of virtue purely in itself, for it is rather the rational impulse towards what is

good; both desire and reason are thus necessary moments in virtue. Hence it cannot be said of virtue that it is misemployed, for it itself is the employer. Thus Aristotle, as we have already seen (Vol. I. pp. 412-414), blames Socrates, because he places virtue in perception alone. There must be an irrational impulse towards what is good, but reason comes in addition as that which judges and determines the impulse; yet when a beginning from virtue has been made, it does not necessarily follow that the passions are in accordance, since often enough they are quite the reverse. Thus in virtue, because it has realization as its aim, and pertains to the individual, reason is not the solitary principle; for inclination is the force that impels, the particular, which as far as the practical side of the individual subject is concerned, is what makes for realization. But then the subject must, in this separation of his activity, bring likewise his passions under the subjection of the universal, and this unity, in which the rational is pre-eminent, is virtue. This is the correct determination; on the one hand this definition is opposed to these ideals of the utter subjection of the passions, by which men are guided from their youth up, and, on the other, it is opposed to the point of view that declares desires to be good in themselves. Both these extreme views have been frequent in modern times, just as sometimes we hear that the man who by nature is beauteous and noble, is better than he who acts from duty; and then it is said that duty must be performed as duty, without taking into account the particular point of view as a moment of the whole.

Aristotle then passes through the particular virtues at great length. Because the virtues, considered as the union of the desiring or realizing with the rational, have an illogical moment within them, Aristotle places[105] their principle on the side of feeling in a mean, so that virtue is the mean between two extremes; *e.g.* liberality is the mean between avarice and prodigality; gentleness between passion and passive endurance; bravery between rashness and cowardice; friendship between egotism and self-

effacement, &c. For the good, and specially that good which has to do with the senses, which would suffer if affected to an excessive degree (*supra*, p. 195), is therefore a mean, just because the sensuous is an ingredient in it. This does not appear to be a sufficient definition, and it is merely a quantitative determination, just because it is not only the Notion that determines, but the empirical side is also present. Virtue is not absolutely determined in itself, but likewise has a material element, the nature of which is capable of a more or a less. Thus if it has been objected to Aristotle's definition of virtue as a difference in degree, that it is unsatisfactory and vague, we may say that this really is involved in the nature of the thing. Virtue, and determinate virtue in its entirety, enters into a sphere where that which is quantitative has a place; thought here is no more as such at home with itself, and the quantitative limit undetermined. The nature of particular virtues is of such a kind, that they are capable of no more exact determination; they can only be spoken of in general, and for them there is no further determination than just this indefinite one.[106] But in our way of looking at things, duty is something absolutely existent in itself, and not a mean between existent extremes through which it is determined; but this universal likewise results in being empty, or rather undetermined, while that determinate content is a moment of being that immediately involves us in conflicting duties. It is in practice that man seeks a necessity in man as individual, and endeavours to express it; but it is either formal, or as in particular virtues, a definite content, which, in so being, falls a prey to empiricism.

β. Politics.

WE HAVE STILL to speak of Aristotle's Politics; he was conscious more or less that the positive substance, the necessary organization and realization of practical spirit, is the state, which is actualized through subjective activity, so that this last finds in it its determination and end. Aristotle hence also looks on political philosophy as the sum total of practical philosophy, the end of the state as general happiness. "All science and all capacity (δύναμις)," he says (Magn. Mor. I. 1), "have an end, and this is the good: the more excellent they are, the more excellent is their end; but the most excellent capacity is the political, and hence its end is also the good." Of Ethics Aristotle recognizes that it indubitably also applies to the individual, though its perfection is attained in the nation as a whole. "Even if the highest good is the same for an individual and for a whole state, it would yet surely be greater and more glorious to win and maintain it for a state; to do this for an individual were meritorious, but to do it for a nation and for whole states were more noble and godlike still. Such is the object of practical science, and this pertains in a measure to politics."[107]

Aristotle indeed appreciates so highly the state, that he starts at once (Polit. I. 2) by defining man as "a political animal, having reason. Hence he alone has a knowledge of good and evil, of justice and injustice, and not the beast," for the beast does not think, and yet in modern times men rest the distinction which exists in these determinations on sensation, which beasts have equally with men. There is also the sense of good and evil, &c., and Aristotle knows this aspect as well (*supra*, p. 202); but that through which it is not animal sensation merely, is thought. Hence rational perception is also to Aristotle the essential condition of virtue, and thus the harmony between

the sensational point of view and that of reason is an essential moment in his eudæmonism. After Aristotle so determines man, he says: “The common intercourse of these, forms the family and the state; in the understanding, however, that the state, in the order of nature” (*i.e.* in its Notion, in regard to reason and truth, not to time) “is prior to the family” (the natural relation, not the rational) “and to the individual among us.” Aristotle does not place the individual and his rights first, but recognizes the state as what in its essence is higher than the individual and the family, for the very reason that it constitutes their substantiality. “For the whole must be prior to its parts. If, for example, you take away the whole body, there is not a foot or hand remaining, excepting in name, and as if anyone should call a hand of stone a hand; for a hand destroyed is like a hand of stone.” If the man is dead, all the parts perish. “For everything is defined according to its energy and inherent powers, so that when these no longer remain such as they were, it cannot be said that anything is the same excepting in name. The state is likewise the essence of the individuals; the individual when separate from the whole, is just as little complete in himself as any other organic part separated from the whole.” This is directly antagonistic to the modern principle in which the particular will of the individual, as absolute, is made the starting-point; so that all men by giving their votes, decide what is to be the law, and thereby a commonweal is brought into existence. But with Aristotle, as with Plato, the state is the *prius*, the substantial, the chief, for its end is the highest in respect of the practical. “But whoever was incapable of this society, or so complete in himself as not to want it, would be either a beast or a god.”

From these few remarks it is clear that Aristotle could not have had any thought of a so-called natural right (if a natural right be wanted), that is, the idea of the abstract man outside of any actual relation to others. For the rest, his Politics contain points of view even now full of instruction for us,

respecting the inward elements of a state,[108] and a description of the various constitutions;[109] the latter, however, has no longer the same interest, on account of the different principle at the base of ancient and modern states. No land was so rich as Greece, alike in the number of its constitutions, and in the frequent changes from one to another of these in a single state; but the Greeks were still unacquainted with the abstract right of our modern states, that isolates the individual, allows of his acting as such, and yet, as an invisible spirit, holds all its parts together. This is done in such a way, however, that in no one is there properly speaking either the consciousness of, or the activity for the whole; but because the individual is really held to be a person, and all his concern is the protection of his individuality, he works for the whole without knowing how. It is a divided activity in which each has only his part, just as in a factory no one makes a whole, but only a part, and does not possess skill in other departments, because only a few are employed in fitting the different parts together. It is free nations alone that have the consciousness of and activity for the whole; in modern times the individual is only free for himself as such, and enjoys citizen freedom alone — in the sense of that of a *bourgeois* and not of a *citoyen*. We do not possess two separate words to mark this distinction. The freedom of citizens in this signification is the dispensing with universality, the principle of isolation; but it is a necessary moment unknown to ancient states. It is the perfect independence of the points, and therefore the greater independence of the whole, which constitutes the higher organic life. After the state received this principle into itself, the higher freedom could come forth. These other states are sports and products of nature which depend upon chance and upon the caprice of the individual, but now, for the first time, the inward subsistence and indestructible universality, which is real and consolidated in its parts, is rendered possible.

Aristotle for the rest has not tried like Plato to describe such a state, but in respect of the constitution he merely points out that the best must rule. But this always takes place, let men do as they will, and hence he has not so very much to do with determining the forms of the constitution. By way of proving that the best must rule, Aristotle says this: “The best would suffer injustice if rated on an equality with the others inferior to them in virtue and political abilities, for a notable man is like a god amongst men.” Here Alexander is no doubt in Aristotle’s mind, as one who must rule as though he were a god, and over whom no one, and not even law, could maintain its supremacy. “For him there is no law, for he himself is law. Such a man could perhaps be turned out of the state, but not subjected to control any more than Jupiter. Nothing remains but, what is natural to all, quietly to submit to such an one, and to let men like this be absolutely and perpetually (ἀΐδιοι) kings in the states”[110] The Greek Democracy had then entirely fallen into decay, so that Aristotle could no longer ascribe to it any merit.

4. The Logic.

On the other side of the Philosophy of Mind, we have still Aristotle’s science of abstract thought, a Logic, to consider. For hundreds and thousands of years it was just as much honoured as it is despised now. Aristotle has been regarded as the originator of Logic: his logical works are the source of, and authority for the logical treatises of all times; which last were, in great measure, only special developments or deductions, and must have been dull, insipid, imperfect, and purely formal. And even in quite recent times, Kant has said that since the age of Aristotle, logic — like pure geometry since Euclid’s day — has been a complete and perfect science which has kept its place even down to the present day, without attaining to any further scientific improvements or alteration. Although logic is here mentioned for the first time, and in the whole of the history of Philosophy

that is to come no other can be mentioned (for no other has existed, unless we count the negation of Scepticism), we cannot here speak more precisely of its content, but merely find room for its general characterization. The forms he gives to us come from Aristotle both in reference to the Notion and to the judgment and conclusion. As in natural history, animals, such as the unicorn, mammoth, beetle, mollusc, &c., are considered, and their nature described, so Aristotle is, so to speak, the describer of the nature of these spiritual forms of thought; but in this inference of the one from the other, Aristotle has only presented thought as defined in its finite application and aspect, and his logic is thus a natural history of finite thought. Because it is a knowledge and consciousness of the abstract activity of pure understanding, it is not a knowledge of this and that concrete fact, being pure form. This knowledge is in fact marvellous, and even more marvellous is the manner in which it is constituted: this logic is hence a work which does the greatest honour to the deep thought of its discoverer and to the power of his abstraction. For the greatest cohesive power in thought is found in separating it from what is material and thus securing it; and the strength shows itself almost more, if thus secured when it, amalgamated with matter, turns about in manifold ways and is seen to be capable of numberless alterations and applications. Aristotle also considers, in fact, not only the movement of thought, but likewise of thought in ordinary conception. The Logic of Aristotle is contained in five books, which are collected together under the name Ὀργανον.

a. The Categories (κατηγορίαι), of which the first work treats, are the universal determinations, that which is predicated of existent things (κατηγορεῖται): as well that which we call conceptions of the understanding, as the simple realities of things. This may be called an ontology, as pertaining to metaphysics; hence these determinations also appear in Aristotle's Metaphysics. Aristotle (Categor. I.) now says: "Things

are termed homonyms (ὁμώνυμα) of which the name alone is common, but which have a different substantial definition (λόγος τῆς οὐσίας); thus a horse and the picture of a horse are both called an animal."

Thus the Notion (λόγος) is opposed to the homonym; and since Aristotle deduces herefrom τὰ λεγόμενα, of which the second chapter treats, it is clear that this last expression indicates more than mere predication, and is here to be taken as determinate Notions. "Determinate conceptions are either enunciated after a complex (κατὰ συμπλοκήν) or after an incomplex manner (ἄνευ συμπλοκῆς); the first as 'a man conquers,' 'the ox runs,' and the other as 'man,' 'ox,' 'to conquer,' 'to run.'" In the first rank of this division Aristotle places τὰ ὄντα, which are undoubtedly purely subjective relations of such as exist *per se*, so that the relation is not in them but external to them. Now although τὰ λεγόμενα and τὰ ὄντα are again distinguished from one another, Aristotle yet again employs both λέγεται, and ἐστί of the ὄντα, so that λέγεται is predicated of a species, in relation to its particular; ἐστί is, on the contrary, employed of a universal, which is not Idea but only simple. For Aristotle says, "There are predicates (ὄντα) which can be assigned to a certain subject (καθ' ὑποκειμένον), yet are in no subject, as 'man' is predicated of 'some certain man,' and yet he is no particular man. Others are in a subject (ἐν ὑποκειμένῳ ἐστί) yet are not predicated of any subject (I mean by a thing being in a subject, that it is in any thing not as a part, but as unable to subsist without that in which it is), as 'a grammatical art' (τὶς γραμματική) is in a subject, 'the soul,' but cannot be predicated of any,' or related as genus to a subject. Some are predicated of a subject (λέγεται) and are in it; science is in the soul and is predicated of the grammatical art. Some again are neither in, nor are predicated of any subject, as 'a certain man,' the individual, the one in number; but some of them can be in a subject like 'a certain grammatical art.'" Instead of subject we should do better to speak of substratum, for it is that to which the Notion

necessarily relates, *i.e.* that which is neglected in abstraction, and thus the individual opposed to the Notion. We can see that Aristotle has the difference of the genus or universal and the individual present to his mind.

The first thing which Aristotle has indicated in the foregoing is thus the genus, which is predicated of a man, but which is not in him, at least not as a particular quality; the brave man, for example, is an actual, but expressed as a universal conception. In formal logic and its conceptions and definitions there is always present opposition to an actual; and the logical actual is in itself something thought, bravery thus being, for example, a pure form of abstraction. This logic of the understanding seeks, however, in its three stages to imitate the categories of the absolute. The conception or definition is a logical actual, and thus in itself merely something thought, *i.e.* possible. In the judgment this logic calls a conception A the actual subject and connects with it another actual as the conception B; B is said to be the conception and A to be dependent on it — but B is only the more general conception. In the syllogism necessity is said to be simulated: even in a judgment there is a synthesis of a conception and something whose existence is assumed; in the syllogism it should bear the form of necessity, because both the opposites are set forth in a third as through the *medius terminus* of reason, *e.g.* as was the case with the mean of virtue (*supra*, p. 206). The major term expresses logical being and the minor term logical potentiality, for Caius is a mere potentiality for logic; the conclusion unites both. But it is to reason that life first unfolds itself, for it is true reality. What comes second in Aristotle is the universal, which is not the genus, *i.e.* it is not in itself the unity of universal and particular — nor is it absolute individuality and hence infinitude. This is the moment or predicate in a subject certainly, but it is not absolutely in and for itself. This relation is now expressed through οὐ λέγεται; for ὅ λέγεται is that which, as universal in itself, is likewise infinite. The third is the particular which is predicated:

just as science in itself is infinite and thus the genus, *e.g.* of the grammatical art; but at the same time as universal, or as not individual, it is the moment of a subject. The fourth indicated by Aristotle is what is called immediate conception — the individual. The reservation that something such as a definite grammatical art is also in a subject, has no place here, for the definite grammatical art is not really in itself individual.

Aristotle, himself,[111] makes the following remarks on this matter: "When one thing is predicated (κατηγορεῖται) of another, as of a subject, whatever things are said (λέγεται) of the predicate," *i.e.* what is related to it as a universal, "may be also said of the subject." This is the ordinary conclusion; from this we see, since this matter is so speedily despatched, that the real conclusion has with Aristotle a much greater significance. "The different genera not arranged under one another (μὴ ὑπ' ἄλλμλα τεταγμένα), such as 'animal' and 'science,' differ in their species (διαφοράς). For instance, animals are divided into beasts, bird, fishes — but science has no such distinction. In subordinate genera, however, there may be the same distinctions; for the superior genera are predicated of the inferior, so that as many distinctions as there are of the predicate, so many will there be of the subject."

After Aristotle had thus far spoken of what is enunciated respecting that which is connected, or the complex, he now comes to "that which is predicated without any connection," or the incomplex; for as we saw (p. 212) this was the division which he laid down in the second chapter. That which is predicated without any connection he treats of more fully as the categories proper, in what follows; yet the work in which these categories are laid down is not to be regarded as complete. Aristotle[112] takes ten of them; "Each conception enunciated signifies either Substance (οὐσίαν), or Quality (ποιόν), or Quantity (ποσόν)," matter, "or Relation (πρός τι), or Where (ποῦ), or When (ποτέ), or Position (κεῖσθαι), or Possession (ἔχειν),

or Action (ποιεῖν), or Passion (πάσχειν). None of these is considered by itself an affirmation (κατάφασις) or a negation (κατάφασις), *i.e.* none is either true or false.” Aristotle adds to these predicables five post predicaments, but he only ranges them all side by side.[113] The categories of relation are the syntheses of quality and quantity, and consequently they belonged to reason; but in as far as they are posited as mere relation, they belong to the understanding and are forms of finitude. Being, essence, takes the first place in them; next to it is possibility, as accident or what is caused; the two are, however, separated. In substance A is Being, B, potentiality; in the relation of causality A and B are Being, but A is posited in B as being posited in a postulation of A. A of substance is logical Being; it is its essence opposed to its existence, and this existence is in logic mere potentiality. In the category of causality the Being of A in B is a mere Being of reflection; B is for itself another. But in reason A is the Being of B as well as of A, and A is the whole Being of A as well as of B.

Aristotle[114] goes on to speak of Substance; first Substance, “in its strictest (κυριώτατα), first and chief sense” is to him the individual, the fourth class of the divisions enunciated above (pp. 212-214). “Secondary substances are those in which as species (εἴδεσι) these first are contained, that is to say, both these and the genera of these species. Of the subject both name and definition (λόγος) of all things predicated of a subject (τῶν καθ᾽ ὑποκειμένον λεγομένον) — of secondary substances — are predicated; for example of the particular man, as subject, both the name and the definition of ‘man’ (living being) are also predicated. But of things which are in a subject (ἐν ὑποκειμένῳ ὄντος) it is impossible to predicate the definition of the” subordinate “subjects, yet with some we predicate the name: the definition of ‘whiteness’ thus is not of the body in which it is, but only the name. All other things however,” besides Definition (λόγος) and “in most cases name, are related to primary substances as subjects” (the individual),

“or are inherent in them. Thus without the primary substances none of the rest could exist, for they are the basis (ὑποκεῖσθαι) of all else. Of secondary substances, species is more substance than genus; for it is nearer to the primary substance, and genus is predicated of the species and not the other way.” For species is here the subject, or what does not always require to be something really determined as individual, but which also signifies that which is generally speaking subordinate. “But the species are not more substance one than another, just as in primary substances one is not more substance than the other. Species and genera are likewise, before the rest” (qualities or accidents) “to be called secondary substances: the definition ‘man’ before the fact that he is ‘white’ or ‘runs.’” Abstraction has thus two kinds of objects; ‘man’ and ‘learned’ are both qualities of a certain individual; but the former only abstracts from the individuality and leaves the totality, and is thus the elevation of the individual into the rational, where nothing is lost but the opposition of reflection. “What is true of substances is also true of differences; for as synonyms (συνώνυμα) they have both name and definition in common.”

b. The second treatise is on Interpretation (περὶ ἑρμηνείας); it is the doctrine of judgments and propositions. Propositions exist where affirmation and negation, falsehood and truth are enunciated;[115] they do not relate to pure thought when reason itself thinks; they are not universal but individual.

c. The Analytics come third, and there are two parts of them, the Prior and the Posterior; they deal most fully with proof (ἀπόδειξις) and the syllogisms of the understanding. “The syllogism is a reason (λόγος) in which if one thing is maintained, another than what was maintained follows of necessity.”[116] Aristotle’s logic has treated the general theory of conclusions in the main very accurately, but they do not by any means constitute the universal form of truth; in his metaphysics, physics,

psychology, &c., Aristotle has not formed conclusions, but thought the Notion in and for itself.

d. The Topics (τοπικά) which treat of 'places' (τόποι) come fourth; in them the points of view from which anything can be considered are enumerated. Cicero and Giordano Bruno worked this out more fully. Aristotle gives a large number of general points of view which can be taken of an object, a proposition or a problem; each problem can be directly reduced to these different points of view, that must everywhere appear. Thus these 'places' are, so to speak, a system of many aspects under which an object can be regarded in investigating it; this constitutes a work which seems specially suitable and requisite for the training of orators and for ordinary conversation, because the knowledge of points of view at once places in our hands the possibility of arriving at the various aspects of a subject, and embracing its whole extent in accordance with these points of view (Vol. I. p. 358). This, according to Aristotle, is the function of Dialectic, which he calls an instrument for finding propositions and conclusions out of probabilities.[117] Such 'places' are either of a general kind, such as difference, similarity, opposition, relation, and comparison,[118] or special in nature, such as 'places' which prove that something is better or more to be desired, since in it we have the longer duration of time, that which the one wise man or several would choose, the genus as against the species, that which is desirable for itself; also because it is present with the more honourable, because it is end, what approximates to end, the more beautiful and praiseworthy, &c.[119] Aristotle (Topic VIII. 2) says that we must make use of the syllogism by preference, with the dialectician, but of induction with the multitude. In the same way Aristotle separates[120] the dialectic and demonstrative syllogisms from the rhetorical and every kind of persuasion, but he counts induction as belonging to what is rhetorical.

e. The fifth treatise, finally, deals with the Sophistical Elenchi (σοφιστικοὶ ἔλεγχοι), or 'On Refutations,' as in the unconscious escape of thought in its categories to the material side of popular conception, it arrives at constant contradiction with itself. The sophistical elenchi betray the unconscious ordinary idea into these contradictions, and make it conscious of them, in order to entrap and puzzle it; they were mentioned by us in connection with Zeno, and the Sophists sought them out, but it was the Megarics who were specially strong in them. Aristotle goes through a number of such contradictions by the way of solving them; in so doing he proceeds quietly and carefully, and spares no pains, though they might have been made more dramatic. We have before (Vol. I. pp. 456-459) found specimens of these in treating of the Megarics, and we have seen how Aristotle solves such contradictions through distinction and determination.

Of these five parts of the Aristotelian Organon, what is produced in our ordinary systems of logic is, as a matter of fact, of the slightest and most trivial description, consisting as it does mainly of what is contained in the introduction of Porphyry. More particularly in the first parts, in the Interpretation and in the Analytics, this Aristotelian logic contains these representations of universal forms of thought, such as are now dealt with in ordinary logic, and really form the basis of what in modern times is known as logic. Aristotle has rendered a never-ending service in having recognized and determined the forms which thought assumes within us. For what interests us is the concrete thought immersed as it is in externalities; these forms constitute a net of eternal activity sunk within it, and the operation of setting in their places those fine threads which are drawn throughout everything, is a masterpiece of empiricism, and this knowledge is absolutely valuable. Even contemplation, or a knowledge of the numerous forms and modes assumed by this activity, is interesting and important enough. For however dry and contentless the enumeration of the different kinds of

judgments and conclusions, and their numerous limitations may appear to us to be, and though they may not seem to serve their purpose of discovering the truth, at least no other science in opposition to this one can be elevated into its place. For instance, if it is held to be a worthy endeavour to gain a knowledge of the infinite number of animals, such as one hundred and sixty-seven kinds of cuckoo, in which one may have the tuft on his head differently shaped from another, or to make acquaintance with some miserable new species of a miserable kind of moss which is no better than a scab, or with an insect, vermin, bug, &c., in some learned work on entomology, it is much more important to be acquainted with the manifold kinds of movement present in thought, than to know about such creatures. The best of what is stated respecting the forms of judgment, conclusion, &c., in ordinary logic, is taken from the works of Aristotle; as far as details are concerned, much has been spun out and added to it, but the truth is to be found with Aristotle.

As regards the real philosophic nature of the Aristotelian logic, it has received in our text-books a position and significance as though it gave expression only to the activity of the understanding as consciousness; hence it is said to direct us how to think correctly. Thus it appears as though the movement of thought were something independent, unaffected by the object of thought; in other words, as if it contained the so-called laws of thought of our understanding, through which we attain to perception, but through a medium which was not the movement of things themselves. The result must certainly be truth, so that things are constituted as we bring them forth according to the laws of thought; but the manner of this knowledge has merely a subjective significance, and the judgment and conclusion are not a judgment and conclusion of things themselves. Now if, according to this point of view, thought is considered on its own account, it does not make its appearance implicitly as knowledge, nor is it without content in and for

itself; for it is a formal activity which certainly is exercised, but whose content is one given to it. Thought in this sense becomes something subjective; these judgments and conclusions are in and for themselves quite true, or rather correct — this no one ever doubted; but because content is lacking to them, these judgments and conclusions do not suffice for the knowledge of the truth. Thus by logicians they are held to be forms whose content is something entirely different, because they have not even the form of the content; and the meaning which is given to them — namely that they are forms — is found fault with. The worst thing said of them, however, is that their only error is their being formal; both the laws of thought as such, and also its determinations, the categories, are either determinations of the judgment only, or merely subjective forms of the understanding, while the thing-in-itself is very different. But in that point of view and in the blame awarded the truth itself is missed, for untruth is the form of opposition between subject and object, and the lack of unity in them; in this case the question is not put at all as to whether anything is absolutely true or not. These determinations have certainly no empirical content, but thought and its movement is itself the content — and, indeed, as interesting a content as any other that can be given; consequently this science of thought is on its own account a true science. But here again we come across the drawback pertaining to the whole Aristotelian manner, as also to all succeeding logic — and that indeed in the highest degree — that in thought and in the movement of thought as such, the individual moments fall asunder; there are a number of kinds of judgment and conclusion, each of which is held to be independent, and is supposed to have absolute truth as such. Thus they are simply content, for they then have an indifferent, undistinguished existence, such as we see in the famous laws of contradiction, conclusions, &c. In this isolation they have, however, no truth; for their totality alone is the truth of thought, because this totality is at once subjective and objective.

Thus they are only the material of truth, the formless content; their deficiency is hence not that they are only forms but rather that form is lacking to them, and that they are in too great a degree content. Thus as many individual qualities of a thing are not anything, such as red, hard, &c., if taken by themselves, but only in their unity constitute a real thing, so it is with the unity of the forms of judgment and conclusion, which individually have as little truth as such a quality, or as a rhythm or melody. The form of a conclusion, as also its content, may be quite correct, and yet the conclusion arrived at may be untrue, because this form as such has no truth of its own; but from this point of view these forms have never been considered, and the scorn of logic rests simply on the false assumption that there is a lack of content. Now this content is none other than the speculative Idea. Conceptions of the understanding or of reason constitute the essence of things, not certainly for that point of view, but in truth; and thus also for Aristotle the conceptions of the understanding, namely the categories, constitute the essential realities of Being. If they are thus in and for themselves true, they themselves are their own, and thus the highest content. But in ordinary logic this is not the case, and even as these are represented in the Aristotelian works they are only universal thought-determinations, between which the abstract understanding makes distinctions. This, however, is not the logic of speculative thought, *i.e.* of reason as distinguished from understanding; for there the identity of the understanding which allows nothing to contradict itself is fundamental. However little this logic of the finite may be speculative in nature, yet we must make ourselves acquainted with it, for it is everywhere discovered in finite relationships. There are many sciences, subjects of knowledge, &c., that know and apply no other forms of thought than these forms of finite thought, which constitute in fact the general method of dealing with the finite sciences. Mathematics, for instance, is a constant series of syllogisms;

jurisprudence is the bringing of the particular under the general, the uniting together of both these sides. Within these relationships of finite determinations the syllogism has now, indeed, on account of its terms being three in number, been called the totality of these determinations, and hence by Kant (Kritik der reinen Vernunft, p. 261) also the rational conclusion; but this syllogism addressed to the intelligence as it appears in the ordinary logical form, is only the intelligible form of rationality, and, as we saw above (p. 76), is very different from the rational syllogism proper. Aristotle is thus the originator of the logic of the understanding; its forms only concern the relationship of finite to finite, and in them the truth cannot be grasped. But it must be remarked that Aristotle's philosophy is not by any means founded on this relationship of the understanding; thus it must not be thought that it is in accordance with these syllogisms that Aristotle has thought. If Aristotle did so, he would not be the speculative philosopher that we have recognized him to be; none of his propositions could have been laid down, and he could not have made any step forward, if he had kept to the forms of this ordinary logic.

Like the whole of Aristotle's philosophy, his logic really requires recasting, so that all his determinations should be brought into a necessary systematic whole — not a systematic whole which is correctly divided into its parts, and in which no part is forgotten, all being set forth in their proper order, but one in which there is one living organic whole, in which each part is held to be a part, and the whole alone as such is true. Aristotle, in the Politics, for instance (*supra*, pp. 207-208), often gives expression to this truth. For this reason the individual logical form has in itself no truth, not because it is the form of thought, but because it is determinate thought, individual form, and to be esteemed as such. But as system and absolute form ruling this content, thought has its content as a distinction in itself, being speculative philosophy in which subject and object are immediately

identical, and the Notion and the universal are the realities of things. Just as duty certainly expresses the absolute, but, as determinate, a determinate absolute which is only a moment and must be able again to abrogate its determination, the logical form which abrogates itself as this determinate in this very way gives up its claim to be in and for itself. But in this case logic is the science of reason, speculative philosophy of the pure Idea of absolute existence, which is not entangled in the opposition of subject and object, but remains an opposition in thought itself. Yet we certainly may allow that much in logic is an indifferent form.

At this point we would leave off as far as the Aristotelian philosophy is concerned, and from this it is difficult to break away. For the further we go into its details, the more interesting it becomes, and the more do we find the connection which exists among the subjects. The fulness with which I have set forth the principal content of the Aristotelian philosophy is justified both by the importance of the matter itself, because it offers to us a content of its own, and also by the circumstances already mentioned (p. 118), that against no philosophy have modern times sinned so much as against this, and none of the ancient philosophers have so much need of being defended as Aristotle.

One of the immediate followers of Aristotle was Theophrastus, born Ol 102, 2 (371 B.C.); though a man of distinction, he can still only be esteemed a commentator on Aristotle. For Aristotle is so rich a treasure-house of philosophic conceptions, that much material is found in him which is ready for further working upon, which may be put forward more abstractly, and in which individual propositions may be brought into prominence. However Aristotle's manner of procedure, which is to take an empirical starting point of ratiocination [Raisonnement], and to comprehend this in the focus of the speculative Notion, is characteristic of his mind, without being one which, on its own account, can be freely elevated into a method and a principle.

Thus of Theophrastus as of many others (Dicæarchus of Messina, for instance), amongst whom Strato of Lampsacus, the successor of Theophrastus, is best known, there is not much to tell. As regards Dicæarchus, Cicero says, (Tusc. Quæst. I. 31, 10) that he controverted the immortality of the soul, for he asserted that "the soul is no more than an empty name, and the whole of the capacities and powers with which we act and feel are equally extended over all living bodies, and inseparable from the body; for it is nothing but the body so constituted as to live and feel through a certain symmetry and proportion in its body." Cicero gives in an historical manner a result as he made it comprehensible to himself, without any speculative conception. Stobæus (Eclog. phys. p. 796), on the other hand, quotes from Dicæarchus that he held the soul to be "a harmony of the four elements." We have only a little general information to give of Strato, that he acquired great fame as a physicist, and that his conception of nature went upon mechanical lines, and yet not on those of Leucippus and Democritus, and later, of Epicurus; for, according to Stobæus (Eclog. phys. p. 298), he made warmth and cold into elements. Hence, if what is said of him is accurate, he was most unfaithful to the beliefs of Aristotle, because he led everything back to mechanism and chance and did away with the immanent end, without accepting the false teleology of modern times. At least, Cicero (De nat. Deor. I. 13) relates of him that he maintained that "divine strength lies altogether in nature, which has in itself the causes of origination, of growth, and of decay, but lacks all sensation and conformation." The other Peripatetics occupied themselves more with working up individual doctrines of Aristotle, with bringing out his works in a commentated form, which is more or less rhetorical in character, though similar in content. But in practical life the Peripatetic school maintained as the principle of happiness, the unity of reason and inclination. We thus may set aside any further expansion of the Peripatetic philosophy, because it has

no longer the same interest, and later on tended to become a popular philosophy (Vol. I. p. 479, Vol. II. p. 130); in this mode it no longer remained an Aristotelian philosophy, although this, too, as what is really speculative, must coincide most closely with actuality. This decay of the Aristotelian philosophy is, indeed, closely connected with the circumstance already mentioned (pp. 126-128), that the Aristotelian writings soon disappeared, and that the Aristotelian philosophy did not retain its place so much through these documents as through the traditions in the school, whereby they soon underwent material changes; and amplifications of Aristotle's doctrines were brought about, as to which it is not known whether some may not have slipped into what pass for his works.

Since Aristotle's leading thought has penetrated all spheres of consciousness, and this isolation in the determination through the Notion, because it is likewise necessary, contains in every sphere the profoundest of true thoughts, Aristotle, to anticipate here the external history of his philosophy as a whole, for many centuries was the constant mainstay of the cultivation of thought. When in the Christian West science disappeared amongst the Christians, the fame of Aristotle shone forth with equal brilliance amongst the Arabians, from whom, in later times, his philosophy was again passed over to the West. The triumph which was celebrated upon the revival of learning, on account of the Aristotelian philosophy having been expelled from the schools, from the sciences, and specially from theology, as from the philosophy which deals with absolute existence, must be regarded in two different aspects. In the first place we must remember that it was not the Aristotelian philosophy which was expelled, so much as the principle of the science of theology which supported itself thereon, according to which the first truth is one which is given and revealed — an hypothesis which is once for all a fundamental one, and by which reason and thought have the right and power to move to and fro only superficially.

In this form the thought which was awakened in the Middle Ages reconstructed its theology more especially, entered into all dialectic movements and determinations, and erected an edifice where the material that was given was only superficially worked up, disposed and secured. The triumph over this system was thus a triumph over that principle, and consequently the triumph of free, spontaneous thought. But another side of this triumph is the triumph of the commonplace point of view that broke free from the Notion and shook off the yoke of thought. Formerly, and even nowadays, enough has been heard of Aristotle's scholastic subtleties; in using this name, men thought that they had a right to spare themselves from entering on abstraction, and, in place of the Notion, they thought that it justified them in seeing, hearing, and thus making their escape to what is called healthy human understanding. In science, too, in place of subtle thoughts, subtle sight has commenced; a beetle or a species of bird is distinguished with as great minuteness as were formerly conceptions and thoughts. Such subtleties as whether a species of bird is red or green in colour, or has a more or less perfect tail, are found more easy than the differences in thought; and in the meantime, until a people has educated itself up to the labour of thought, in order to be able thus to support the universal, the former is a useful preparation, or rather it is a moment in this course of culture.

But inasmuch as the deficiency in the Aristotelian philosophy rests in the fact, that after the manifold of phenomena was through it raised into the Notion, though this last again fell asunder into a succession of determinate Notions, the unity of the absolute Notion which unites them was not emphasized, and this is what succeeding time had to accomplish. What now appears is that the unity of the Notion which is absolute existence, makes its appearance as necessity, and it presents itself first as the unity of self-consciousness and consciousness, as pure thought. The unity of existence as

existence is objective unity, thought, as that which is thought. But unity, as Notion, the implicitly universal negative unity, time as absolutely fulfilled time, and in its fulfilment as being unity, is pure self-consciousness. Hence we see it come to pass, that pure self-consciousness makes itself reality, but, at the same time, it first of all does so with subjective significance as a self-consciousness that has taken up its position as such, and that separates itself from objective existence, and hence is first of all subject to a difference which it does not overcome.

Here we have concluded the first division of Greek philosophy, and we have now to pass to the second period. The first period of Greek philosophy extended to Aristotle, to the attainment of a scientific form in which knowledge has reached the standing of free thought. Thus in Plato and Aristotle the result was the Idea; yet we saw in Plato the universal made the principle in a somewhat abstract way as the unmoved Idea; in Aristotle, on the other hand, thought in activity became absolutely concrete as the thought which thinks itself. The next essential, one which now is immediately before us, must be contained in that into which Philosophy under Plato and Aristotle had formed itself. This necessity is none other than the fact that the universal must now be proclaimed free for itself as the universality of the principle, so that the particular may be recognized through this universal; or the necessity of a systematic philosophy immediately enters in, what we formerly called one in accordance with the unity of the Notion. We may speak of the Platonic and Aristotelian systems, but they are not in the form of a system; for that it is requisite that one principle should be maintained and consistently carried through the particular. In the perfect complex of the conception of the universe as it is to Aristotle, where everything is in the highest form of scientific knowledge led back to what is speculative, however empiric may be his manner of setting to work, there certainly is one principle brought forward, and that a

speculative one, though it is not brought forward as being one. The nature of the speculative has not been explicitly brought to consciousness as the Notion — as containing in itself the development of the manifold nature of the natural and spiritual universe, consequently it is not set forth as the universal, from which the particular was developed. Aristotle's logic is really the opposite of this. He in great measure passes through a series of the living and the dead, makes them confront his objective, that is, conceiving thought, and grasps them in his understanding; each object is on its own account a conception which is laid open in its determinations, and yet he also brings these reflections together, and thereby is speculative. If even Plato on the whole proceeded in an empiric way, taking up this and that idea, each of which is in turn examined, with Aristotle this loose method of procedure appears still more clearly. In the Aristotelian teaching the Idea of the self-reflecting thought is thus grasped as the highest truth; but its realization, the knowledge of the natural and spiritual universe, constitutes outside of that Idea a long series of particular conceptions, which are external to one another, and in which a unifying principle, led through the particular, is wanting. The highest Idea with Aristotle consequently once more stands only as a particular in its own place and without being the principle of his whole philosophy. Hence the next necessity in Philosophy is that the whole extent of what is known must appear as one organization of the Notion; that in this way the manifold reality may be related to that Idea as the universal, and thereby determined. This is the standpoint which we find in this second period.

A systematic philosophy such as this becomes in the first place dogmatism, in antagonism to which, because of its one-sided character, scepticism immediately arises. In the same way the French call what is dogmatic *systématique*, and *système* that in which all the conceptions must consistently proceed from one determination; hence to them *systématique* is

synonymous with one-sided. But the philosophies that ensue are one-sided, because in them it was only the necessity of one principle that was recognized, without their meanwhile developing from themselves, as might well have come to pass in and for itself, the Idea as the real universal, and thus comprehending the world in such a way that the content is only grasped as the determination of the self-reflective thought. Hence this principle stands up formally and abstractly, and the particular is not yet deduced from it, for the universal is only applied to the particular and the rules for this application sought out. In Aristotle the Idea is at least implicitly concrete, as the consciousness of the unity of subjective and objective, and therefore it is not one-sided. Should the Idea be truly concrete, the particular must be developed from it. The other relation would be the mere bringing of the particular under the universal, so that both should be mutually distinguished; in such a case the universal is only a formal principle, and such a philosophy is therefore one-sided. But the true difficulty is that the two endeavours, the development of the particular from the Idea, and the bringing of the particular under the universal, collide with one another. The manifestations of the physical and spiritual world must first, from their respective sides, be prepared for and worked into the Notion, so that the other sciences can form therefrom universal laws and principles. Then for the first time can speculative reason present itself in determinate thoughts, and bring perfectly to consciousness the inwardly existing connection between them. As dogmatic, however, those philosophies, it may be further said, are assertive likewise, because in such a method the principle is only asserted and is not truly proved. For a principle is demanded under which everything is subsumed; thus it is only pre-supposed as the first principle. Before this we have had abstract principles such as pure Being, but here the particular, with which begins the distinction from what is different, became posited as the purely negative.

That necessity, on the other hand, makes for a universal which must likewise be in the particular, so that this should not be set aside, but should have its determinate character through the universal.

This demand for a universal, even though still unproved principle, is henceforth present to knowledge. What answers to this demand now appears in the world through the inward necessity of mind — not externally, but as being in conformity with the Notion. This necessity has produced the philosophy of the Stoics, Epicureans, New Academy, and Sceptics, which we have now to consider. If we have remained too long in the consideration of this period, we may now make amends for this protraction, for in the next period we may be brief.

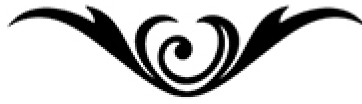
SECTION TWO Second Period: Dogmatism and Scepticism.

IN THIS SECOND period, which precedes the Alexandrian philosophy, we have to consider Dogmatism and Scepticism — the Dogmatism which separates itself into the two philosophies, the Stoic and the Epicurean; and the third philosophy, of which both partake and which yet differs from them both, Scepticism. Along with this last we would take the New Academy, which has entirely merged in it — while in the Older Academy, Plato's philosophy indubitably still maintained its purity. We saw at the close of the previous period the consciousness of the Idea, or of the Universal, which is an end in itself — a principle, universal indeed, but at the same time determined in itself, which is thus capable of subsuming the particular, and of being applied thereto. The application of universal to particular is here the relationship that prevails, for the reflection that from the universal itself the separation of the totality is developed, is not yet present. There always is in such a relationship the necessity of a system and of systematization; that is to say, one determinate principle must consistently be applied to the particular, so that the truth of all that is particular should be determined according to this abstract principle, and be at the same time likewise recognized. Now since this is what we have in so-called Dogmatism, it is a philosophizing of the understanding, in which Plato's and Aristotle's speculative greatness is no longer present.

In respect of this relationship, the task of Philosophy now comes to be summed up in the twofold question which we spoke of earlier (Vol. I. pp. 474, 475), and which has regard to a criterion of truth and to the wise man.

At this point we may better than before, and also from a different point of view, explain the necessity for this phenomenon. For because truth has now become conceived as the harmony of thought and reality, or rather as the identity of the Notion, as the subjective, with the objective, the first question is what the universal principle for judging and determining this harmony is; but a principle through which the true is judged (κρίνεται) to be true, is simply the criterion. Yet because this question had only been formally and dogmatically answered, the dialectic of Scepticism, or the knowledge of the one-sidedness of this principle as a dogmatic principle, at once appeared. A further result of this mode of philosophizing is that the principle, as formal, is subjective, and consequently it has taken the real significance of the subjectivity of self-consciousness. Because of the external manner in which the manifold is received, the highest point, that in which thought finds itself in its most determinate form, is self-consciousness. The pure relation of self-consciousness to itself is thus the principle in all these philosophies, since in it alone does the Idea find satisfaction, just as the formalism of the understanding of the present so-called philosophizing seeks to find its fulfilment, the concrete which is opposed to this formalism, in the subjective heart, in the inward feelings and beliefs. Nature and the political world are certainly also concrete, but externally concrete; the arbitrary concrete is, on the other hand, not in the determinate universal Idea, but only in self-consciousness and as being personal. The second ruling determination is consequently that of the wise men. Not reason alone, but everything must be something thought, that is, subjectively speaking, my thought; that which is thought, on the contrary, is only implicit, that is to say, it is itself objective in so far as it appears in the form of the formal identity of thought with itself. The thought of the criterion as of the one principle is, in its immediate actuality, the subject itself; thought and the thinker are thus immediately connected. Because the

principle of this philosophy is not objective but dogmatic, and rests on the impulse of self-consciousness towards self-satisfaction, it is the subject whose interests are to be considered. The subject seeks on its own account a principle for its freedom, namely, immovability in itself; it must be conformable to the criterion, *i.e.* to this quite universal principle, in order to be able to raise itself into this abstract independence. Self-consciousness lives in the solitude of its thought, and finds therein its satisfaction. These are the fundamental determinations in the following philosophies: the exposition of their main principles will come next, but to go into details is not advisable.



Although, as no doubt is the case, these philosophies, as regards their origin, pertain to Greece, and their great teachers were always Greeks, they were yet transferred to the Roman world; thus Philosophy passed into the Roman world and these systems in particular constituted under Roman rule the philosophy of the Roman world, in opposition to which world, unsuited as it was to the rational practical self-consciousness, this last, driven back into itself from external actuality, could only seek for reason in itself and could only care for its individuality — just as abstract Christians only care for their own salvation. In the bright Grecian world the individual attached himself more to his state or to his world, and was more at home in it. The concrete morality, the impulse towards the introduction of the principle into the world through the constitution of the state, which we see in Plato, the concrete science that we find in Aristotle, here disappear. In the wave of adversity which came across the Roman world, everything beautiful and noble in spiritual individuality was rudely swept away. In this condition of disunion in the world, when man is driven within his inmost self, he has to seek the unity and satisfaction, no longer to be found in the world, in an abstract way. The Roman world is thus the world of abstraction, where one cold rule was extended over all the civilized world. The living

individualities of national spirit in the nations have been stifled and killed; a foreign power, as an abstract universal, has pressed hard upon individuals. In such a condition of dismemberment it was necessary to fly to this abstraction as to the thought of an existent subject, that is, to this inward freedom of the subject as such. As what was held in estimation was the abstract will of the individual ruler of the world, the inward principle of thought also had to be an abstraction which could bring forth a formal, subjective reconciliation only. A dogmatism erected on a principle made effectual through the form of the understanding could alone satisfy the Roman mind. These philosophies are thus conformable to the spirit of the Roman world, as indeed Philosophy in general ever stands in close connection with the world in its ordinary aspect (Vol. I. pp. 53, 54). The Roman world has, indeed, produced a formal patriotism and corresponding virtue, as also a developed system of law; but speculative philosophy could not proceed from such dead material — we could only expect good advocates and the morality of a Tacitus. These philosophies, always excepting Stoicism, also arose amongst the Romans in opposition to their ancient superstitions, just as now Philosophy comes forward in the place of religion.

The three principles of Stoicism, Epicureanism and Scepticism are necessary; in the first there is the principle of thought or of universality itself, but yet determined in itself; the abstract thought is here the determining criterion of the truth. There is opposed to thought, in the second place, the determinate as such, the principle of individuality, feeling generally, sensuous perception and observation. These two form the principles of the Stoic and Epicurean philosophies. Both principles are one-sided and, as positive, become sciences of the understanding; just because this thought is not in itself concrete but abstract, the determinateness falls outside of thought and must be made a principle for itself; for it has an

absolute right as against abstract thought. Besides Stoicism and Epicureanism, there is, in the third place, Scepticism, the negation of these two one-sided philosophies which must be recognized as such. The principle of Scepticism is thus the active negation of every criterion, of all determinate principles of whatever kind they be, whether knowledge derived from the senses, or from reflection on ordinary conceptions, or from thought. Thus the next result arrived at is that nothing can be known. Yet the imperturbability and uniformity of mind in itself, which suffers through nothing, and which is affected neither by enjoyment, pain, nor any other bond, is the common standpoint and the common end of all these philosophies. Thus however gloomy men may consider Scepticism, and however low a view they take of Epicureanism, all these have in this way been philosophies.

A. The Philosophy of the Stoics.

WE MUST, FIRST of all, and in a general way, remark of Stoicism, as also of Epicureanism, that they came in the place of the philosophy of the Cynics and Cyrenaics as their counterpart, just as Scepticism took the place of the Academy. But in adopting the principle of these philosophies, they at the same time perfected it and elevated it more into the form of scientific thought. Yet because in them, just as in the others, the content is a fixed and definite one, since self-consciousness therein sets itself apart, this circumstance really puts an end to speculation, which knows nothing of any such rigidity, which rather abolishes it and treats the object as absolute Notion, as in its difference an unseparated whole. Hence with the Stoics, as also really with the Epicureans, instead of genuine speculation, we only meet with an application of the one-sided, limited principle, and thus we require in both to enter merely upon a general view of their principle. Now if Cynicism made reality for consciousness the fact of being immediately natural (where immediate naturalness was the simplicity of the individual, so that he is independent and, in the manifold movement of desire, of enjoyment, of holding many things to be reality, and of working for the same, really keeps up the external simple life) the Stoic elevation of this simplicity into thought consists in the assertion, not that immediate naturalness and spontaneity is the content and the form of the true Being of consciousness, but that the rationality of nature is grasped through thought, so that everything is true or good in the simplicity of thought. But while with Aristotle what underlies everything is the absolute Idea as unlimited and not set forth in a determinate character and with a difference — and its deficiency is only the deficiency which is present in realization, the not

being united into one Notion — here the one Notion is undoubtedly set forth as real existence, and everything is related to it, and hence the requisite relation is undoubtedly present; but that in which everything is one is not the true. With Aristotle each conception is considered absolutely in its determination and as separate from any other; here the conception certainly is in this relation and is not absolute, but at the same time it is not in and for itself. Because thus the individual is not considered absolutely but only relatively, the whole working out is not interesting, for it is only an external relation. Likewise with Aristotle the individual only is taken into consideration, but this consideration is lost sight of by the speculative treatment adopted: here, however, the individual is taken up and the treatment is likewise external. This relation is not even consistent, if, as also happens, something such as nature is considered in itself; for the absolute falls outside of it, since its consideration is only a system of reasoning from indeterminate principles, or from principles which are only the first that come to hand.

As a contribution to the history of the philosophy of the Stoics, we first of all desire to mention the more eminent Stoics. The founder of the Stoic School is Zeno (who must be distinguished from the Eleatic); he belonged to Cittium, a town in Cyprus, and was born about the 109th Olympiad. His father was a merchant who, from his business visits to Athens, then, and for long afterwards, the home of Philosophy and of a large number of philosophers, brought with him books, particularly those of the Socratics, whereby a love and craving for knowledge was awakened in his son. Zeno himself travelled to Athens, and, according to some, he found a further motive to live for Philosophy, in that he lost all his possessions by a shipwreck. What he did not lose was the cultured nobility of his mind and his love of rational understanding. Zeno visited several sections of the Socratics, and particularly Xenocrates, a man belonging to the Platonic

School, who, on account of the strictness of his morality and the austerity of his whole demeanour, was very celebrated. Thus he underwent the same ordeals as those to which the holy Francis of Assisi subjected himself, and succumbed to them just as little. This may be seen by the fact that while no testimony was given without oath in Athens, the oath was in his case dispensed with, and his simple word believed — and his teacher Plato is said often to have remarked to him that he might sacrifice to the Graces. Then Zeno also visited Stilpo, a Megaric, whom we already know about (Vol. I. p. 464), and with whom he studied dialectic for ten years. Philosophy was considered as the business of his life, and of his whole life, and not studied as it is by a student who hurries through his lectures on Philosophy in order to hasten on to something else. But although Zeno principally cultivated dialectic and practical philosophy, he did not, like other Socratics, neglect physical philosophy, for he studied very specially Heraclitus' work on Nature, and finally came forward as an independent teacher in a porch called Poecile (στοὰ ποικίλη), which was decorated with the paintings of Polygnotus. From this his school received the name of Stoic. Like Aristotle his principal endeavour was to unite Philosophy into one whole. As his method was characterized by special dialectic skill and training, and by the acuteness of his argumentation, so he himself was distinguished, in respect of his personality, by stern morality, which resembles somewhat that of the Cynics, though he did not, like the Cynics, try to attract attention. Hence with less vanity his temperance in the satisfaction of his absolute wants was almost as great, for he lived on nothing but water, bread, figs and honey. Thus amongst his contemporaries Zeno was accorded general respect; even King Antigonus of Macedonia often visited him and dined with him, and he invited him to come to him in a letter quoted by Diogenes: this invitation, however, Zeno in his reply refused, because he was now eighty years of age. But the circumstance that

the Athenians trusted to him the key of their fortress, speaks for the greatness of their confidence in him; indeed, according to Diogenes, the following resolution was passed at a meeting of the people: “Because Zeno, the son of Mnaseas, has lived for many years in our town as a philosopher, and, for the rest, has proved himself to be a good man, and has kept the youths who followed him in paths of virtue and of temperance, having led the way thereto with his own excellent example, the citizens decide to confer on him a public eulogy, and to present him with a golden crown, on account both of his virtue and his temperance. In addition to this he shall be publicly buried in the Ceramicus. And for the crown and the building of the tomb, a commission of five men shall be appointed.” Zeno flourished about the 120th Olympiad (about 300 B.C.) at the same time as Epicurus, Arcesilaus of the New Academy, and others. He died at a great age, being ninety-eight years of age (though some say he was only seventy-two), in the 129th Olympiad; for being tired of life, he put an end to it himself either by strangulation or by starvation — just because he had broken his toe.[121]

Amongst the succeeding Stoics Cleanthes must be specially singled out; he was a disciple and the successor of Zeno in the Stoa, and author of a celebrated Hymn to God, which Stobæus has preserved. He is well known by an anecdote told respecting him. It is said that he was called in accordance with the law before a court of justice in Athens to give an account of the means by which he maintained himself. He then proved that at night he carried water for a gardener, and by means of this occupation, earned as much as he required in order in the day to be in Zeno’s company — as to which the only point which is not quite comprehensible to us is how, even in such a way, philosophy, of all things, could be studied. And when for this a gratuity was voted to him from the public treasury, he refused it at Zeno’s instigation. Like his teacher, Cleanthes also died voluntarily, in his eighty-first year, by abstaining from food.[122]

Of the later Stoics there were many more who could be named as having been famous. More distinguished in science than Cleanthes was his disciple, Chrysippus of Cilicia, born Ol. 125, 1 (474 A.U.C.; 280 B.C.), who likewise lived in Athens, and who was specially active in promoting the wide cultivation and extension of the philosophy of the Stoics. His logic and dialectic were what contributed most largely to his fame, and hence it was said that if the gods made use of dialectic, they would use none other than that of Chrysippus. His literary activity is likewise admired, for the number of his works, as Diogenes Laërtius tells us, amounted to seven hundred and five. It is said of him in this regard that he wrote five hundred lines every day. But the manner in which his writings were composed detracts very much from our wonder at this facility in writing, and shows that most of his works consisted of compilations and repetitions. He often wrote over again respecting the very same thing; whatever occurred to him he put down on paper, dragging in a great variety of evidence. Thus he quoted almost entire books by other writers; and someone gave expression to the belief that if all that belonged to others were taken away from his books, only white paper would be left. But of course it is not so bad as all this, as we may see by all the quotations from the Stoics, where the name of Chrysippus is placed at the head, as it always is, and his conclusions and explanations are used by preference. His writings, of which Diogenes Laërtius mentions a long list, have, however, all been lost to us; so much is nevertheless correct, that he was the main constructor of the Stoic logic. While it is to be regretted that some of his best works have not come down to us, it is, perhaps, a good thing that all are not preserved; if we had to choose between having all or none, the decision would be a hard one. He died in the 143rd Olympiad (212 B.C.).[123]

In the period immediately following, Diogenes of Seleucia in Babylonia is a distinguished figure; Carneades, the celebrated Academic, is said to

have learned dialectic from him, and he is also noteworthy because with this Carneades and Critolaus, a Peripatetic thinker, in Olympiad 156, 2 (598 A.U.C., or 156 B.C.) and in the time of the elder Cato, he was sent as Athenian ambassador to Rome — an embassy which first caused the Romans to make acquaintance with Greek philosophy, dialectic and rhetoric, in Rome itself. For those philosophers there gave lectures and discourses.[124]

Besides these, Panaetius is well known as having been Cicero's instructor; the latter wrote his treatise, *De Officiis*, after Panaetius. Finally, we have Posidonius, another equally famous teacher, who lived for long in Rome in the time of Cicero.[125]

Later on we see the philosophy of the Stoics pass over to the Romans, that is to say, it became the philosophy of many Romans, though this philosophy did not gain anything as a science by so doing. On the contrary, as in the case of Seneca and the later Stoics, in Epictetus or Antoninus, all speculative interest was really lost, and a rhetorical and hortatory disposition shown, of which mention cannot be made in a history of Philosophy any more than of our sermons. Epictetus of Hierapolis in Phrygia, born at the end of the first century after Christ, was first of all the slave of Epaphroditus, who, however, freed him, after which he betook himself to Rome. When Domitian banished the philosophers, poisoners and astrologers from Rome (94 A.D.), Epictetus went to Nicopolis, in Epirus, and taught there publicly. From his lectures Arrian compiled the voluminous *Dissertationes Epicteteæ*, which we still possess, and also the manual ἐγχειρίδιον of Stoicism.[126] We still have the Meditations εἰς ἑαυτόν of the Emperor Marcus Aurelius Antoninus, in twelve books; he first of all ruled along with Lucius Aurelius Verus from 161 to 169 A.D., and then from 169 to 180 alone and he conducted a war with the Marcomanni. In his Meditations he always speaks to himself; these reflections are not, however,

speculative in nature, being admonitions, such as that man should exercise himself in every virtue.

We have no other original works by the older Stoics. For the Stoic Philosophy, too, the sources on which we formerly could count are cut off. The sources from which a knowledge of the philosophy of the Stoics is to be derived are, however, well known. There is Cicero, who was himself a Stoic, though in his representation there is great difficulty in discovering how, for instance, the principle of Stoic morality is to be distinguished from that which constitutes the principle of the morality of the Peripatetics. And, more particularly, we have Sextus Empiricus, whose treatment is mainly theoretic, and is thus interesting from a philosophic point of view. For Scepticism has had to do with Stoicism more especially. But also Seneca, Antoninus, Arrian, the manual of Epictetus, and Diogenes Laërtius must really be called into council.

As regards the philosophy of the Stoics themselves, they definitely separated it into those three parts which we have already met with (Vol. I. p. 387, Vol. II. pp. 48, 49), and which will, generally speaking, be always found. There is Logic in the first place; secondly, Physics, or Natural Philosophy; and thirdly, Ethics, or the Philosophy of Mind, on the practical side especially. The content of their philosophy has, however, not much that is original or productive.

1. Physics.

As regards the Physics of the Stoics, we may in the first place say that it does not contain much that is peculiar to itself, since it is rather a compendium of the Physics of older times, and more especially of that of Heraclitus. However, each of the three schools now being dealt with has had a very characteristic and definite terminology, which is more than can be altogether said of the philosophy of Plato and Aristotle. Thus we must

now make ourselves familiar with the particular expressions used and with their significance. The following is the essence of the Physics of the Stoics: The determining reason (λόγος) is the ruling, all-productive substance and activity, extended throughout all, and constituting the basis of all natural forms; this preponderating substance, in its rational effectuating activity, they call God. It is a world-soul endowed with intelligence, and, since they called it God, this is really Pantheism. But all Philosophy is pantheistic, for it goes to prove that the rational Notion is in the world. The hymn of Cleanthes is to this effect: "Nothing happens on earth without thee, O Dæmon, neither in the ethereal pole of the heavens, nor in the sea, excepting what the wicked do through their own foolishness. But thou knowest how to make crooked things straight, and thou orderest that which is without order, and the inimical is friendly to thee. For thus hast thou united everything into one, the good to the evil; thus one Notion (λόγος) is in everything that ever was, from which those mortals who are evil flee. How unhappy are they, too, who, ever longing to possess the good, do not perceive God's universal law, nor listen thereto, the which if they but obeyed with reason, (σὺν νῷ) they would attain a good and happy life!"[127] The Stoics thus believed the study of nature to be essential, in order to know in nature its universal laws, which constitute the universal reason, in order that we might also know therefrom our duties, the law for man, and live conformably to the universal laws of nature. "Zeno," according to Cicero (De nat. Deor. I. 14), "holds this natural law to be divine, and believes that it has the power to dictate the right and prohibit what is wrong." Thus the Stoics desired to know this rational Notion which rules in nature not altogether on its own account; and the study of nature was consequently to them rather a mere matter of utility.

If we are now to give some further idea of what these Physics are, we may say that the Stoics distinguish in the corporeal — although nature is

only the manifestation of one common law — the moment of activity and that of passivity; the former is, according to Aristotle, active reason, or, according to Spinoza, *natura naturans*; the latter passive reason, or *natura naturata*. The latter is matter, substance without quality, for quality is, generally speaking, form, *i.e.* that which forms universal matter into something particular. This is indeed the reason likewise that with the Greeks quality is called τὸ ποιόν, just as we in German derive *Beschaffenheit* from *Schaffen* — that which is posited, the negative moment. But the actuating, as the totality of forms, is, according to the Stoics, the Notion in matter; and this is God. (Diog. Laërt. VII. 134.)

As regards the further nature of these forms, these universal laws of nature, and the formation of the world, the Stoics have in the main adopted the ideas of Heraclitus, for Zeno studied him very particularly (*supra*, p. 239). They thus make fire the real Notion, the active principle which passes into the other elements as its forms. The world arises by the self-existent gods driving the universal material substance (οὐσίαν) out of the fire, through the air, into the water; and as in all generation the moisture which surrounds a seed comes first as the begetter of all that is particular, so that conception, which in this respect is called seed-containing (σπερματικός), remains in the water and then actuates the indeterminate Being of matter into the origination of the other determinations. The elements, fire, water, air and earth, are consequently primary. Respecting them the Stoics speak in a manner which has no longer any philosophic interest. "The coagulation of the denser parts of the world forms the earth; the thinner portion becomes air, and if this becomes more and more rarefied, it produces fire. From the combination of these elements are produced plants, animals, and other kinds of things." The thinking soul is, according to them, of a similar fiery nature, and all human souls, the animal principle of life, and also plants, are parts of the universal world-soul, of the universal fire; and this central point is

that which rules and impels. Or, as it is put, souls are a fiery breath. Sight, in the same way, is a breath of the ruling body (ἡγεμονικοῦ) transmitted to the eyes; similarly hearing is an extended, penetrating breath, sent from the ruling body to the ears.[128]

Respecting the process of nature we may further say this: Fire, Stobæus tells us (Eclog. phys. I. p. 312), is called by the Stoics an element in a pre-eminent sense, because from it, as the primary element, all else arises through a transformation, and in it, as in an ultimate, everything is fused and becomes dissolved. Thus Heraclitus and Stoicism rightly comprehended this process as a universal and eternal one. This has even been done by Cicero, though in a more superficial way; in this reflection he falsely sees the conflagration of the world in time and the end of the world, which is quite another matter. For in his work *De natura Deorum* (II. 46) he makes a Stoic speak thus: "In the end (*ad extremum*) everything will be consumed by fire; for if all moisture becomes exhausted the earth can neither be nourished, nor can air return into existence. Thus nothing but fire remains, through whose reanimation and through God the world will be renewed and the same order will return." This is spoken after the manner of the ordinary conception. But to the Stoics everything is merely a Becoming. However deficient this may be, God, as the fiery principle, is yet to them the whole activity of nature, and likewise the rational order of the same, and in this lies the perfect pantheism of the Stoic conception of nature. Not only do they call this ordering force God, but also nature, fate or necessity (εἱμαρμένην), likewise Jupiter, the moving force of matter, reason (νοῦν) and foresight (πρόνοιαν); to them all these are synonymous.[129] Because the rational brings forth all, the Stoics compare this impelling activity to a seed, and say: "The seed which sends forth something rational (λογικόν) is itself rational. The world sends forth the seeds of the rational and is thus in itself rational;" that is to say, rational both generally, in the whole, and in each

particular existent form. "All beginning of movement in any nature and soul rises from a ruling principle, and all powers which are sent forth upon the individual parts of the whole proceed from the ruling power as from a source; so that each force that is in the part is also in the whole, because the force is distributed by the ruling power in it. The world embraces the seed-containing conceptions of the life which is in conformity with the conception," *i.e.* all particular principles.[130] The Physics of the Stoics is thus Heraclitean, though the logical element is entirely at one with Aristotle; and we may regard it as being such. However, speaking generally, only those belonging to earlier times had a physical element in their philosophy: those coming later neglected Physics entirely and kept alone to Logic and to Ethics.

The Stoics again speak of God and the gods according to the popular manner of regarding them. They say that "God is the ungenerated and imperishable maker of all this disposition of things, who after certain periods of time absorbs all substance in Himself, and then reproduces it from Himself."[131] There no definite perception is reached, and even the above relation of God, as absolute form, to matter has attained no developed clearness. The universe is at one time the unity of form and matter, and God is the soul of the world; at another time, the universe, as nature, is the Being of the constituted matter, and that soul is antagonistic to it, but the activity of God is a disposition of the original forms of matter.[132] This opposition is devoid of the essentials of union and division.

Thus the Stoics remain at the general conception that each individual is comprehended in a Notion, and this again in the universal Notion, which is the world itself. But because the Stoics recognized the rational as the active principle in nature, they took its phenomena in their individuality as manifestations of the divine; and their pantheism has thereby associated itself with the common ideas about the gods as with the superstitions which

are connected therewith (p. 235), with belief in all sorts of miracles and with divination — that is to say, they believe that in nature there are intimations given which men must receive through divine rites and worship. Epicureanism, on the contrary, proceeds towards the liberation of men from this superstition to which the Stoics are entirely given over. Thus Cicero, in his work *De divinatione*, has taken the most part of his material from them, and much is expressly given as being the reasoning of the Stoics. When, for example, he speaks of the premonitory signs given in connection with human events, all this is conformable with the Stoic philosophy. The fact that an eagle flies to the right, the Stoics accepted as a revelation of God, believing that thereby it was intimated to men what it was advisable for them to do in some particular circumstances. Just as we find the Stoics speaking of God as having universal necessity, to them God, as Notion, has hence a relation to men and human ends likewise, and in this respect He is providence; thus they now arrived at the conception of particular gods also. Cicero says in the work quoted above (II. 49): "Chrysippus, Diogenes and Antipater argued thus: If gods exist, and if they do not let men know beforehand what is to happen in the future, they cannot love men, or else they themselves do not know what stands before them in the future, or they are of opinion that it does not signify whether man knows it or not, or they consider such a revelation beneath the dignity of their majesty, or they cannot make it comprehensible to men." All this they refute, for amongst other things they say that nothing can exceed the beneficence of the gods, &c. Thus they draw the conclusion that "the gods make known to men the future" — a system of reasoning in which the entirely particular ends of individuals also form the interests of the gods. To make men know and comprehend at one time and not at another, is an inconsistency, *i.e.* an incomprehensibility, but this very incomprehensibility, this obscurity, is the triumph of the common way of regarding religions affairs. Thus in the

Stoics all the superstitions of Rome had their strongest supporters; all external, teleological superstition is taken under their protection and justified. Because the Stoics started from the assertion that reason is God (it certainly is divine, but it does not exhaust divinity), they immediately made a bound from this universal to the revelation of that which operates for the sake of individual ends. The truly rational is doubtless revealed to men as the law of God; but the useful, what is in conformity with individual ends, is not revealed in this truly divine revelation.

2. Logic.

In the second place, as to the intellectual side of the philosophy, we must first of all. consider the principle of the Stoics in answering the question of what the true and rational is. In regard to the source of our knowledge of truth, or of the criterion, which in those times used to be discussed (Vol. I. p. 474, Vol. II. p. 233), the Stoics decided that the scientific principle is the conception that is laid hold of (φαντασία καταληπτική), for the true as well as for the good; for the true and good are set forth as content or as the existent. Thus a unity of apprehending thought and Being is set forth in which neither can exist without the other; by this is meant not sensuous conception as such, but that which has returned into thought and become proper to consciousness. Some of the older Stoics, amongst whom we certainly find Zeno, called this criterion the very truth of reason (ὀρθὸς λόγος). Ordinary conception on its own account (φαντασία) is an impression (τύπωσις), and for it Chrysippus used the expression alteration (ἑτεροίωσις).[133] But that the conception should be true, it must be comprehended; it begins with feeling, whereby in fact the type of another is brought into us; the second step is that we should transform this into part of ourselves, and this first of all occurs through thought.

According to Cicero's account (Academ. Quæst. IV. 47), Zeno illustrated the moments of this appropriation by a movement of the hand. When he showed the open palm he said that this was a sensuous perception; when he bent the fingers somewhat, this was a mental assent through which the conception is declared to be mine; when he pressed them quite together and formed a fist, this was comprehension (κατάληψις), just as in German we speak of comprehension [Begreifen] when by means of our senses we lay hold of anything in a similar way; when he then brought the left hand into play and pressed together that fist firmly and forcibly, he said that this was science, in which no one but the wise man participated. This double pressure, my pressing with the other hand that which is grasped, is said to signify conviction, my being conscious of the identity of thought with the content. "But who this wise man is or has been the Stoics never say," adds Cicero; and of this we shall afterwards have to speak in greater detail. In fact, the matter is not made clear through this gesticulation of Zeno's. The first action, the open hand, is sensuous apprehension, immediate seeing, hearing, &c.; the first motion of the hand is then, speaking generally, spontaneity in grasping. This first assent is likewise given by fools; it is weak, and may be false. The next moment is the closing of the hand, comprehension, taking something in; this makes the ordinary conception truth, because the ordinary conception becomes identical with thought. By this my identity with this determination is indeed set forth, but this is not yet scientific knowledge, for science is a firm, secure, unchangeable comprehension through reason or thought, which is that which rules or directs the soul. Midway between scientific knowledge and folly is the true Notion as the criterion, although as yet it is not itself science; in it thought gives its approbation to existence and recognizes itself, for approbation is the harmony of a thing with itself. But in scientific knowledge a perception of the first elements and determinate knowledge through thought of the

object is contained. Thus the ordinary conception as apprehended is thought; scientific knowledge is the consciousness of thought, the knowledge of that harmony.

We may also give our assent to these conclusions of the Stoics with their various stages, since in them there is a perception which is undoubtedly true. In this we have an expression of the celebrated definition of the truth, by which it is made the harmony of object and consciousness; but at the same time it is well to remark that this is to be understood simply, and not as indicating that consciousness had a conception, and that on the other side stood an object, which two had to harmonize with one another, and hence that a third was necessarily brought into existence which had to compare them. Now this would be consciousness itself, but what this last can compare is nothing more than its conception, and — not the object, but — its conception again. Consciousness thus really accepts the conception of the object; it is by this approbation that the conception actually receives truth — the testimony of mind to the objective rationality of the world. It is not, as is ordinarily represented, that a round object here impresses itself upon wax, that a third compares the form of the round and of the wax and, finding them to be similar, judges that the impress must have been correct, and the conception and the thing have harmonized. For the action of thought consists in this, that thought in and for itself gives its approbation and recognizes the object as being in conformity with itself; this it is in which lies the power of truth — or approbation is the expression of this harmony, or judgment itself. In this, say the Stoics, the truth is contained; it is an object which is likewise thought, so that the thought that gives its assent is the ruling thought which posits the harmony of subject with content. The fact that anything is or has truth is thus not because it is (for this moment of Being is only ordinary conception), but the fact that it is, has its power in the approbation of consciousness. But this thought alone and

for itself is not the truth, nor is the truth as such contained in it, for the Notion requires the objective element and is only the rational consciousness respecting the truth. But the truth of the object itself is contained in the fact that this objective corresponds to thought, and not the thought to the objective; for this last may be sensuous, changeable, false, and contingent, and thus it is untrue for mind. This is the main point as far as the Stoics are concerned, and even if we discover the Stoic speculative doctrines from their antagonists better than from their originators and advocates, yet from them, too, this idea of unity proceeds; and while both sides of this unity are opposed, both are necessary, but thought is essential reality. Sextus Empiricus (adv. Math. VIII. 10) understands this thus: "The Stoics say that as regards the perceptible and that which is thought some things alone are true; what is felt, however, is not immediate (ἐξ εὐθείας), for it becomes true for the first time through its relation to the thought that corresponds to it." Thus neither is immediate thought the true, excepting in so far us it corresponds to the Notion and is known through the working out of rational thought.

This general idea is the only one which is interesting in the Stoics, but even in this very principle, limitations are found to be present. It merely expresses the truth as subsisting in the object, as thought of, yet for that very reason it is still a very formal determination, or not in itself the real Idea. From this point of view Sextus Empiricus (adv. Math. X. 183) examines the Stoics, and he considers and discusses them in all sorts of ways. The most striking thing that he says is what relates to the following. The fact that anything is, rests in its being thought — the fact that it is thought in something being there; the one is the pre-supposition of the other. That is to say, the Stoics assert that a thing exists, not because it is, but through thought; but consciousness for its existence requires another, for thought is likewise one-sided. In this criticism by Sextus it is indicated

that thought requires an object as an external to which it gives its approbation. There can be no talk of its being here indicated that the thinking mind in order to exist as consciousness does not require the object; this is really inherent in its conception. But the "this" of the object as an external is only a moment which is not the only one or the essential. It is the manifestation of mind, and mind exists only in that it appears; this therefore must come to pass in it, that it must have its object as external and give its approbation to it — that is, it must withdraw from this relationship into itself and therein recognize its unity. But likewise, having gone into itself, it has now from itself to beget its object and give itself the content which it sends forth from itself. Stoicism is only this return of mind into itself, positing the unity of itself and the object, and recognizing the harmony; but not the going forth again to the extension of the real knowledge of a content from itself. We do not find Stoicism getting any farther, for it stops short at making the consciousness of this unity its object, without developing it in the slightest; thus reason remains the simple form which does not go on to the distinction of the content itself. Hence the formalism of this celebrated standard, and of the standpoint from which all truth of content is judged, rests farther in the fact that the thought of thought, as what is highest, finds this content indeed conformable to itself and appropriates it, since it transforms it into the universal, but its determinations are given. For if thought predominates, still it is always universal form alone. On account of this universality thought yields nothing but the form of identity with itself; the ultimate criterion is thus only the formal identity of the thought which discovers harmony. But it may be asked, with what? For there no absolute self-determination, no content that proceeds from thought as such is to be found; and hence everything may harmonize with my thought. The criterion of the Stoics is consequently only the principle of contradiction; yet when we remove the contradiction from absolute reality, it is indeed self-identical,

but for that very reason empty. The harmony must be a higher one; there must be harmony with self in what is other than self, in content, in determination; and thus it must be harmony with harmony.

In accordance with this recognition of the principle of the Stoics, both their logic and their morality is judged; neither the one nor the other arrives at being immanent free science. We have already remarked (p. 241) that they also occupied themselves with logical definitions, and since they made abstract thought the principle, they have brought formal logic to great perfection. Logic is hence to them logic in the sense that it expresses the activity of the understanding as of conscious understanding; it is no longer as with Aristotle, at least in regard to the categories, undecided as to whether the forms of the understanding are not at the same time the realities of things; for the forms of thought are set forth as such for themselves. Then along with this comes in, for the first time, the question respecting the harmony of thought and object or the demand that an appropriate content of thought be shown. However, since all given content may be taken into thought and posited as something thought without therefore losing its determinate character, and this determinate character contradicts and does not support the simplicity of thought, the taking of it up does not help at all; for its opposite may also be taken up and set forth as something thought. The opposition is thereby, however, only in another form; for instead of the content being in outward sensation as something not pertaining to thought and not true, as it formerly was, it now pertains to thought, but is unlike it in its determinateness, seeing that thought is the simple. Thus what was formerly excluded from the simple Notion, now comes into it again; this separation between activity of the understanding and object must indeed be made, but likewise the unity in the object as such has to be shown, if it is only something thought. Hence Scepticism cast up this opposition more especially to the Stoics, and the Stoics amongst themselves had always to

improve on their conceptions. As we have just seen (p. 250) in Sextus Empiricus, they did not quite know whether they should define conception as impression or alteration, or in some other way. Now if this conception is admitted into that which directs the soul, into pure consciousness, Sextus further asks (since thought *in abstracto* is the simple and self-identical which, as incorporeal, is neither passive nor active), How can an alteration, an impression, be made on this? Then the thought-forms are themselves incorporeal. But, according to the Stoics, only the corporeal can make an impression or bring about an alteration.[134] That is to say, on the one hand, because corporeal and incorporeal are unlike they cannot be one; and, on the other, incorporeal thought-forms, as capable of no alteration, are not the content, for this last is the corporeal only.

If the thought-forms could in fact have attained the form of content, they would have been a content of thought in itself. But as they were they had value as laws of thought (λεκτά)[135] merely. The Stoics indeed had a system of immanent determinations of thought, and actually did a great deal in this direction; for Chrysippus specially developed and worked out this logical aspect of things, and is stated to have been a master in it (*supra*, pp. 240, 241). But this development took a very formal direction; there are the ordinary well-known forms of inference, five of which are given by Chrysippus, while others give sometimes more and sometimes fewer. One of them is the hypothetical syllogism through remotion, "When it is day it is light, but now it is night and hence it is not light." These logical forms of thought are by the Stoics held to be the unproved that requires no proof; but they are likewise only formal forms which determine no content as such. The wise man is specially skilful in dialectic, we are told by the Stoics, for all things, both physical and ethical, are perceived through a knowledge of logic.[136] But thus they have ascribed this perception to a subject, without stating who this wise man is (p. 250). Since objective grounds by which to

determine the truth are wanting, the ultimate decision is attributed to the will of the subject; and this talk about the wise man consequently has its ground in nothing but the indefiniteness of the criterion, from which we cannot get to the determination of content.

It would be superfluous to speak further of their logic any more than of their theory of judgments, which in part coincides with it, and in part is a grammar and a rhetoric; by it no real scientific content can be reached. For this logic is not, like Plato’s dialectic, the speculative science of the absolute Idea; but, as formal logic, as we saw above (p. 254), it is science as the firm, secure, unalterable comprehension of reasons, and stops short at the perception of the same. This logical element, whose essence consists pre-eminently in escaping to the simplicity of the conception to that which is not in opposition to itself nor falls into contradiction, obtains the upper hand. This simplicity, which has not negativity and content in itself, requires a given content which it may not abrogate — but consequently it cannot thus attain to a genuine “other” through itself. The Stoics have constituted their logic often in the most isolated fashion; the principal point that is established here is that the objective corresponds to thought, and they investigated this thought more closely. If in a manner it is quite correct to say that the universal is the true, and that thought has a definite content that must also be concrete, the main difficulty, which is to deduce the particular determination from the universal, so that in this self-determination it may remain identical with itself, has not been solved by the Stoics: and this the Sceptics brought to consciousness. This is the point of view most important in the philosophy of the Stoics; it thus showed itself in their physics also.

3. Ethics.

Since the theory of mind, the doctrine of knowledge, came before us in the investigation of the criterion, we have, in the third and last place, to speak

of the morality of the Stoics, to which is due their greatest fame, but which does not rise above this formal element any more than what precedes, although it cannot be denied that in presenting it they have taken a course which seems very plausible to the popular conception, but which in fact is to a great extent external and empiric.

a. In order, in the first place, to find the definition of virtue, Chrysippus gives some good expositions of practical ethics which Diogenes Laërtius (VII. 85, 86) quotes at considerable length; they are psychological in character and in them Chrysippus establishes his formal harmony with himself. For according to him the Stoics say: "The first desire (ὁρμή) of the animal is for self-preservation, because nature from the beginning reconciled each existence with itself. This first object innate in every animal" (immanent desire) "is thus the harmony of the animal with itself, and the consciousness of the same," the self-consciousness through which "the animal is not alienated from itself. Thus it repels what is injurious and accepts what is serviceable to it." This is Aristotle's conception of the nature of adaptation to an end, in which, as the principle of activity, both the opposite and its sublation are contained. "Enjoyment is not the first object, for it" (the sense of satisfaction) "is only for the first time added when the nature of an animal that seeks itself through itself, receives into itself that which is in conformity with its harmony with itself." This is likewise worthy of approbation: self-consciousness, enjoyment, is just this return into self, the consciousness of this unity in which I enjoy something and thereby have my unity as this individual in the objective element. The case is similar in regard to man; his end is self-preservation, but with a conscious end, with consideration, according to reason. "In plants nature operates without voluntary inclination (ὁρμῆς) or sense-perception, but some things in us take place in the same manner as in plants." For in the plant there also is the seed-containing conception, but it is not in it as end, nor as its object,

for it knows nothing about it. "In animals inclination comes in; in them nature makes their impulses conformable to their first principle;" *i.e.* the end of inclination is simply the first principle of their nature, and that through which they make for their own preservation. "Rational creatures likewise make nature their end, but this is to live according to reason, for reason becomes in them the artist who produces inclination," *i.e.* it makes a work of art in man from what in the animal is desire merely. To live in accordance with nature is thus, to the Stoics, to live rationally.

This now appears somewhat like certain receipts given by the Stoics for the purpose of discovering right motive forces in regard to virtue. For their principle put generally is this: "Men must live in conformity with nature, *i.e.* with virtue; for to it" (rational) "nature leads us." That is the highest good, the end of everything — a most important form in Stoic morality, which appears in Cicero as *finis bonorum* or *summum bonum*. With the Stoics right reason and the securing of it on its own account, is the highest principle. But here, too, we immediately see that we are thereby merely led round in a circle in a manner altogether formal, because virtue, conformity to nature, and reason, are only determined through one another. Virtue consists in living conformably with nature, and what is conformable to nature is virtue. Likewise thought must further determine what is in conformity with nature, but conformity with nature again is that alone which is determined through reason. The Stoics further say, according to Diogenes Laërtius (VII. 87, 88) "To live according to nature is to live according to that which experience teaches us of the laws both of universal nature and of our own nature, by doing nothing which universal law forbids; and that law is the right reason which pervades everything, being the same with Jupiter, the disposer (καθηγεμόνι) of the existing system of things. The virtue of the happy man is when everything occurs according to the harmony of the genius (δαίμονος) of each individual with reference to

the will of the disposer of all things.” Thus everything remains as it was in a universal formalism.

We must throughout allow to the Stoics that virtue consists in following thought, *i.e.* the universal law, right reason; anything is moral and right only in as far as a universal end is in it fulfilled and brought into evidence. This last is the substantial, the essential nature of a relationship, and in it we have that which is really in thought alone. The universal which must be the ultimate determination in action, is, however, not abstract, but the universal in this relationship, just as, for example, in property the particular is placed on one side. Because man, as a man of thought and culture, acts according to his perception, he subordinates his impulses and desires to the universal; for they are individual. There is in each human action an individual and particular element; but there is a distinction as to whether the particular as such is solely insisted upon or whether in this particular the universal is secured. It is to the securing of this universal that the energy of Stoicism is directed. But this universal has still no content and is undetermined, and thereby the Stoic doctrines of virtue are incomplete, empty, meaningless and tedious. Virtue indeed is commended in a forcible, lively and edifying manner, but as to what this universal law of virtue is, we have no indications given us.

b. The other side as regards the good is external existence, and the agreement of circumstances, of external nature, with the end aimed at by man. For although the Stoics have expressed the good as being conformity with law, in relation to the practical will, they yet defined it, according to Diogenes Laërtius (VII. 94, 95), as being at the same time the useful, “either absolutely and immediately useful or not contrary to utility,” so that generally speaking the useful is, as it were, the accident of virtue. “The Stoics likewise distinguished manifold good into good having reference to the soul, and external good; the former indicates virtues and their actions;

the latter the fact of pertaining to a noble country, having a virtuous friend, and so on. In the third place it is neither external nor is it a matter of self-consciousness alone, when the self-same man is virtuous and happy.” These conclusions are quite good. Morality does not require to look so coldly on what concerns utility, for every good action is in fact useful, *i.e.* it has actuality and brings forth something good. An action which is good without being useful is no action and has no actuality. That which in itself is useless in the good is its abstraction as being a non-reality. Men not only may, but must have the consciousness of utility; for it is true that it is useful to know the good. Utility means nothing else but that men have a consciousness respecting their actions. If this consciousness is blameworthy, it is still more so to know much of the good of one’s action and to consider it less in the form of necessity. Thus the question was raised as to how virtue and happiness are related to one another, a theme of which the Epicureans have also treated. Here it was, as in more recent times, regarded as the great problem to discover whether virtue gives happiness, taken altogether by itself, whether the conception of happiness is included in its conception. That union of virtue and happiness, as the mean, is thus rightly represented as being perfect, neither pertaining only to self-consciousness nor to externality.

α. In order to be able to give a general answer to this question, we most recollect what was said above of the principle of self-preservation, according to which virtue has to do with the rational nature. The fulfilment of its end is happiness as finding itself realized, and as the knowledge or intuitive perception of itself as an external — a harmony of its Notion or its genius with its Being or its reality. The harmony of virtue with happiness thus means that the virtuous action realizes itself in and for itself, man becomes in it an immediate object to himself, and he comes to the perception of himself as objective, or of the objective as himself. This rests

in the conception of action and particularly of good action. For the bad destroys reality and is opposed to self-preservation; but the good is what makes for its self-preservation and effectuates it — the good end is thus the content that realizes itself in action. But in this general answer to that question, properly speaking, the consciousness of the implicitly existent end has not sufficiently exactly the signification of virtue, nor has action proceeding from the same exactly the signification of virtuous action, neither has the reality which it attains the signification of happiness. The distinction rests in the fact that the Stoics have merely remained at this general conception, and set it forth immediately as actuality; in it however, the conception of virtuous action is merely expressed, and not reality.

β. A further point is that just because the Stoics have remained at this position, the opposition between virtue and happiness immediately enters in, or, in abstract form, that between thought and its determination. These opposites are with Cicero *honestum* and *utile*, and their union is the question dealt with.[137] Virtue, which is living in accordance with the universal law of nature, is confronted by the satisfaction of the subject as such in his particularity. The two sides are, in the first place, this particularity of the individual, which, in the most varied aspects has existence in me as the abstract "this," for example, in the pre-supposition of determinate inclinations; and here we have pleasure and enjoyment in which my existence harmonizes with the demands of my particularity. In the second place, I, as the will that fulfils law, am only the formal character which has to carry out the universal; and thus, as willing the universal, I am in accord with myself as thinking. The two now come into collision, and because I seek the one satisfaction or the other, I am in collision with myself, because I am also individual. As to this we may hear many trivial things said, such as that things often go badly with the virtuous and well with the wicked, and that the latter is happy, &c. By going well all external

circumstances are understood, and on the whole the content is quite uninteresting, for it is constituted by the attainment of commonplace ends, points of view and interests. Such at once show themselves, however, to be merely contingent and external; hence we soon get past this standpoint in the problem, and thus external enjoyment, riches, noble birth, &c., do not accord with virtue or happiness. The Stoics indeed said: "The implicitly good is the perfect" (that which fulfils its end) "in accordance with the nature of the rational; now virtue is such, but enjoyment, pleasure and such-like are its accessories"[138] — the end of the satisfaction of the individual on his own account. Thus these may be the concomitants of virtue, although it is a matter of indifference whether they are so or not, for since this satisfaction is not end, it is equally a matter of indifference if pain is the concomitant of virtue. Conduct which is according to reason only, thus further contains man's abstract concentration within himself, and the fact that the consciousness of the true enters into him, so that he renounces everything that belongs to immediate desires, feelings, &c.

In this quite formal principle of holding oneself in a pure harmony with oneself of a merely thinking nature, there now rests the power of becoming indifferent to every particular enjoyment, desire, passion and interest. Because this following of the determinations of reason is in opposition to enjoyment, man should seek his end or satisfaction in nothing else than in the satisfaction of his reason, in satisfying himself in himself, but not in anything outwardly conditioned. Hence much has been said by the Stoics in respect of that which pertains to the passions being something that is contradictory. The writings of Seneca and Antoninus contain much that is true in this regard, and they may be most helpful to those who have not attained to the higher degree of conviction. Seneca's talent must be recognized, but we must also be convinced that it does not suffice. Antoninus (VIII. 7) shows psychologically that happiness or pleasure is not

a good. “Regret is a certain self-blame, because something useful has failed, the good must be something useful, and the noble and good man must make the same his interest. But no noble and good man will feel regret that he has fallen short in pleasure; pleasure is thus neither useful nor good. The man who has the desire for glory after his death does not recollect that he who holds him in remembrance himself dies also, and again he who follows this one, until all recollection through these admiring ones who have passed away, has been extinguished.” Even if this independence and freedom is merely formal, we must still recognize the greatness of this principle. However, in this determination of the abstract inward independence and freedom of the character in itself lies the power which has made the Stoics famous; this Stoic force of character which says that man has only to seek to remain like himself, thus coincides with the formal element which I have already given (p. 254). For if the consciousness of freedom is my end, in this universal end of the pure consciousness of my independence all particular determinations of freedom which are constituted by duties and laws, have disappeared. The strength of will of Stoicism has therefore decided not to regard the particular as its essence, but to withdraw itself therefrom; we see on the one hand, that this is a true principle, but on the other, it is at the same time abstract still.

Now because the principle of the Stoic morality professes to be the harmony of mind with itself, what should be done is not to let this remain formal, and therefore not to let what is not contained in this self-contained be any longer shut out of it. That freedom which the Stoics ascribe to man is not without relation to what is other than himself; thus he is really dependent, and under this category happiness really falls. My independence is only one side, to which the other side, the particular side of my existence, hence does not yet correspond. The old question, which at this time again

came up, thus concerns the harmony between virtue and happiness. We speak of morality rather than virtue, because that according to which I ought to direct my actions is not, as in virtue, my will, as it has become custom. Morality really contains my subjective conviction that that which I do is in conformity with rational determinations of will, with universal duties. That question is a necessary one, a problem which even in Kant's time occupied men, and in endeavouring to solve it we must begin by considering what is to be understood by happiness. Much more is afterwards said of that in which satisfaction is to be sought. However, from what is external and exposed to chance we must at once break free. Happiness in general means nothing more than the feeling of harmony with self. That which is pleasing to the senses is pleasing because a harmony with ourselves is therein contained. The contrary and unpleasing is, on the other hand, a negation, a lack of correspondence with our desires. The Stoics have posited as the very essence of enjoyment this harmony of our inner nature with itself, but only as inward freedom and the consciousness, or even only the feeling of this harmony, so that enjoyment such as this is contained in virtue itself. Yet this enjoyment ever remains a secondary matter, a consequence, which in so far as it is so cannot be made end, but should only be considered as an accessory. The Stoics said in this regard that virtue is alone to be sought, but with virtue happiness on its own account is found, for it confers blessing explicitly as such. This happiness is true and imperturbable even if man is in misfortune;[139] thus the greatness of the Stoic philosophy consists in the fact that if the will thus holds together within itself, nothing can break into it, that everything else is kept outside of it, for even the removal of pain cannot be an end. The Stoics have been laughed at because they said that pain is no evil.[140] But toothache and the like are not in question as regards this problem. We cannot but know we are subject to such; pain like this, and unhappiness are, however, two different

things. Thus the problem throughout is only to be understood as the demand for a harmony of the rational will with external reality. To this reality there also belongs the sphere of particular existence, of subjectivity, of personality, of particular interests. But of these interests the universal alone truly pertains to this reality, for only in so far as it is universal, can it harmonize with the rationality of the will. It is thus quite right to say that suffering, pain, &c., are no evil, whereby the conformity with myself, my freedom, might be destroyed; I am elevated over such in the union which is maintained with myself, and even if I may feel them, they can still not make me at variance with myself. This inward unity with myself as felt, is happiness, and this is not destroyed by outward evil.
